### ERRORS AND OMISSIONS

It is the intent of Engineering Information, Inc. to publish accurate abstracts of significant technical literature. However, Engineering Information, Inc. is not responsible for errors or omissions that may occur nor for erroneous matter contained in primary publications and reported in abstracts.

All questions regarding bibliographic information or editorial content in Ei's publications should be addressed to the Customer Services Department, Engineering Information, Inc., 345 East 47th Street, New York, N.Y. 10017-2387 USA. Telephone: 212-705-7600 or 800-221-1044. Telex: 4990438.

# **A Guide for Using The Engineering Index<sup>R</sup> Annual**

## **DESCRIPTION**

*The Engineering Index Annual* is an organized compilation of bibliographic citations and abstracts covering the world's technological literature in all engineering disciplines. The literature covered is found in published journals, technical reports, monographs, conference proceedings, directories and other material. A listing of all the material covered each year may be found in Ei's *PIE: Publications Indexed for Engineering*, which is published separately.

The machine-readable version of *The Engineering Index*<sup>R</sup>, known as COMPENDEX<sup>R</sup> (COMPuterized ENgineering InDEX), and COMPENDEX<sup>R</sup>\*PLUS is available via a number of online vendors or via direct lease or license from Ei. Contact the Marketing Division of Engineering Information, Inc. for details.

*The Engineering Index Annual*—1988 is organized as follows: Parts I, II, III, IV, and V contain the Abstract Section. Parts VI, VII, VIII, and IX contain the Author Index, the Author Affiliation Index and the Subject Index.

## **ARRANGEMENT OF CONTENTS**

The citations and abstracts in *The Engineering Index Annual* are arranged under main subject headings selected from Engineering Information, Inc.'s authority list of indexing terms, *SHE: Subject Headings for Engineering*, which is published separately. Where indicated in *SHE*, Ei's main subject headings may be further combined with subheadings in order to provide a more specific description of the subject (e.g., SUPERCONDUCTING MATERIALS—Microwaves). In *The Engineering Index Annual*, main subject headings are printed in boldface upper case, while subheadings are printed in boldface upper and lower case.

"See" and "See Also" cross-references follow both the main subject headings and subheadings and act as guides to related headings and additional abstracts of interest.

*The Engineering Index Annual* abstract number is found at the beginning of each abstract. Abstract numbers run consecutively, starting with number 000001. It should be noted that the abstract numbers in *The Engineering Index Annual* are not the same as those found in *The Engineering Index*<sup>R</sup> *Monthly*, as these two sets of numbers result from separate sorting processes.

The title of the article (or paper, report, monograph, etc.) follows the abstract number and is printed in boldface upper case. If a title is in a language other than English, an English translation of the title will follow, enclosed in brackets and printed in boldface upper and lower case.

Following the text of the abstract, the bibliographic citation is presented. The citation includes the author(s) name(s), the first author's affiliation and information describing the source document in which the paper appears. The source information is in abbreviated form. The full title of the original source material may be found in Ei's *PIE: Publications Indexed for Engineering*, which is published annually.

## **CONFERENCE LITERATURE COVERAGE**

*The Engineering Index Annual* contains abstracts which provide reviews of the conference proceedings covered by Ei. These reviews describe the overall content of the proceedings volume. Ei's COMPENDEX<sup>R</sup>\*PLUS and the Ei ENGINEERING MEETINGS<sup>R</sup> databases provide coverage of the individual professional and technical papers appearing in the published proceedings of these conferences. For complete details on this Ei service, contact: Engineering Information, Inc., Marketing Division.

## **ACRONYMS, INITIALS AND ABBREVIATIONS OF ORGANIZATION NAMES**

Each issue of *The Engineering Index Annual* includes a list defining the acronyms, initials and abbreviations used in the current publications of Engineering Information, Inc.

## LOCATING AN ABSTRACT OF INTEREST

### BY SUBJECT—IN THE ABSTRACT SECTION

Abstracts are arranged under the heading or heading-subheading combination which best represents the main subject area of the original article. The controlled vocabulary from which headings and subheadings are selected is found in the Ei publication, *SHE: Subject Headings for Engineering*.

To locate abstract(s) of interest, search under appropriate subject terms, under specific applications of the subject, and under synonymous terminology. For example, if you are interested in the general subject of superconducting materials, search in the abstract section of *The Engineering Index<sup>R</sup> Annual* (Volumes I-V) under SUPERCONDUCTING MATERIALS, which is a valid heading. If you are interested in a specific aspect or application of superconducting materials, such as "microstructure" or "microwaves", search under the main heading SUPERCONDUCTING MATERIALS and the subheading of choice. You will find applicable subheadings arranged in alphabetical order following the main heading.

*The Engineering Index Annual* includes cross-references from many of its subject headings which will lead the searcher to related headings and additional abstracts of interest.

### SAMPLE ENTRY

The following example identifies the elements of a typical record.

Heading → **SUPERCONDUCTING MATERIALS** See  
Also ALUMINUM AND ALLOYS—Electric Properties;  
BISMUTH COMPOUNDS—High Temperature Effects;  
CERAMIC MATERIALS—Electric Conductivity; CE-  
RAMIC MATERIALS—Electronic Properties; CERAMIC  
MATERIALS—Phase Transitions; CERAMIC MATERI-  
ALS—Sintering; CERAMIC MATERIALS—Structure;  
COPPER COMPOUNDS; COPPER OXIDE—Electronic  
Properties; ELECTRIC CONDUCTORS—Materials; ELEC-  
TRIC CONTACTS, POINT—Electric Conductivity; GADO-  
LINIUM COMPOUNDS—Magnetic Properties; HYDRO-  
GEN—Research; INTERMETALLICS—Synthesis; LAN-  
THANUM COMPOUNDS—Magnetic Properties; LAN-  
THANUM COMPOUNDS—Spectroscopic Analysis;

← Cross-References

Subheading → **Microstructure** See Also FILMS—Superconducting;  
LANTHANUM COMPOUNDS—X-Ray Analysis; NEU-  
TRONS—Diffraction; NIOBIUM TITANIUM ALLOYS  
—Electric Conductivity.

Abstract Number → **108337** **OBSERVATIONS CONCERNING THE** ← Title of Article  
**TWIN MICROSTRUCTURE IN  $\text{YBa}_2\text{Cu}_3\text{O}_x$**  When ob-  
served under the optical microscope using polarized light,  
the grains of the  $90^\circ$  oxide superconductor,  $\text{YBa}_2\text{Cu}_3\text{O}_x$ ,  
display arrays of parallel twin planes. A sample of this  
material was placed in a scanning electron microscope  
(SEM) and imaged using a backscattered electron detec-  
tor. The results present strong evidence that the optical  
twins are transformation twins which form during the  
tetragonal to orthorhombic phase transition. The trans-  
formation occurred at quite low temperatures, around  
 $250^\circ\text{C}$ , probably due to the loss of oxygen in the vacuum.

Issue, Date and Pages of  
Source Publication

## BY SUBJECT—IN THE SUBJECT INDEX

The Subject Index is an alphabetical arrangement of controlled vocabulary terms, printed in boldface, and free language terms, printed in lightface, which provides access to the abstracts in *The Engineering Index<sup>R</sup> Annual—1988* and each issue of *The Engineering Index<sup>R</sup> Monthly—1988*. Each entry is followed by the titles of the articles in that subject which are abstracted in *The Engineering Index Annual—1988* and *The Engineering Index Monthly—1988*. Titles are displayed in upper case if the original article is in English, if the title is a transliteration of a non-Roman alphabet or has been translated from Chinese or Japanese. Titles displayed in upper and lower case are translations of non-English titles (other than Chinese or Japanese). In these cases, the original language of the non-English title is provided in parentheses.

Subject Index title entries are followed by *The Engineering Index Annual* abstract number, which is preceded by an "A"; and, *The Engineering Index Monthly* abstract number, which is preceded by an "M."

To identify abstracts of interest, search under headings and heading-subheading combinations from Ei's controlled vocabulary, *SHE: Subject Headings for Engineering*; search also under acronyms, popular terminology, software program names, trademarks and product names, other proper names, specific chemicals, metals, materials, etc. Relevant abstracts can then be accessed in either the abstract section of *The Engineering Index Annual—1988* or the abstract sections of the issues of *The Engineering Index Monthly—1988*, using the corresponding abstract number(s).

Example—

## BY AUTHOR

*The Engineering Index<sup>R</sup> Annual* contains an author index arranged alphabetically by surname. All authors of abstracted articles are included in the index, followed by the appropriate abstract number(s).

Author names are cited by Ei as they appear in the original article. Frequently the same author will be cited in different articles with full first and middle names, with first initial only, with first and middle initials and with other variations. The searcher should, therefore, scan the Author Index under the surname of interest for possible variations.

Example—

Verhoeven, Bas, 057158  
Verhoeven, J., 114658

Verhoeven, J.D., 084375, 026715, 104606, 108337, 070381
--

Verhoeven, J.J., 087261  
Verhuel, H., 008345

## BY AUTHOR AFFILIATION

*The Engineering Index Annual* includes an index which provides the organizational affiliation of the first author given in the original article. The Author Affiliation Index is arranged alphabetically by organization name and each entry is followed by the appropriate abstract number(s).

Organization names are cited by Ei as they appear in the original article. As the same organization may appear in different publications in various styles, the searcher should scan the Author Affiliation Index for possible variations.

Example—

Iowa Dep of Agriculture, Des Moines, IA, USA	006234
Iowa State Univ, Amado, AZ, USA	044602

Iowa State Univ, Ames, IA, USA	104112 104309 104606 106211 106744 108337 109967 109968 110587 112151 114234 114858
--------------------------------	---

Iowa State Univ at Ames, Ames, IA, USA	050363
Iowa State Univ, IA, USA	006837 034542 070432

## ORIGINAL ARTICLE SOURCES

The full text of most of the articles cited in *The Engineering Index*<sup>R</sup> may be ordered directly from Engineering Information, Inc.

### Ordering

Orders are accepted by phone, mail, facsimile or electronically through major online vendor ordering services (check vendor for details). There are no additional charges for these ordering mechanisms.

A detailed order form can be found on page xii. Make as many copies of this order form as you need. Additional order forms can be obtained from Engineering Information, Inc.

Original Articles Charges*	
Each article (up to 20 pages)	\$15.00
Each additional page (over 20)	\$.40
Publisher copyright royalties	Royalties over \$3.00 billed at cost
Orders outside of North America	Billed at cost
<u>Facsimile</u> Articles up to 10 pages	\$5.00
Over 10 pages	\$.50 per page
Special Delivery	Billed at cost
Rush Service	\$10.00/copy

\*All prices are quoted in U.S. dollars

### Delivery & Billing

Most requests are filled within 7 working days. Articles are delivered by first class mail. Articles sent outside of North America are delivered by air mail at an additional charge. Rush requests (extra charge) receive priority handling and are sent by rapid delivery courier to ensure next day delivery. Facsimile orders are an additional \$5.00 per document; special delivery is billed at cost.

Deposit accounts are encouraged as a convenience to customers. A minimum prepaid deposit of \$150 (10 documents) is required. Deposit account statements will be mailed monthly if there is ordering activity on your account.

If you do not have a deposit account the invoice will be shipped with order. MasterCard and Visa accepted.

### CONTACT

## ORDERING INFORMATION

All orders and inquiries should be sent to:

Engineering Information, Inc.  
Customer Services Department  
345 E. 47th Street  
New York, N.Y. 10017-2387

Telephone: 212-705-7600  
Telex: 4990438  
Cable: ENGINFOR NEWYORK  
Facsimile: 212-832-1857

or use our convenient toll-free number (U.S. except New York) for ordering, customer service or online help:  
800-221-1044

### SALES REPRESENTATIVE

Orders, inquiries and claims from the United Kingdom, Ireland and Western Europe should be directed to:  
Thompson, Henry Ltd.  
London Road, Sunningdale  
Berks SL5 OEP  
England  
Telephone: Ascot (0990) 24615  
FAX: (0990) 26120

### FULFILLMENT

All subscriptions are entered on a calendar year basis only. Orders are accepted at any time during the year with all previously published issues being supplied in the first shipment.

Standing orders are encouraged to ensure uninterrupted product delivery and continuity of search capabilities.

Ei guarantees replacement of any non-delivered, incomplete or damaged products.

Cancellations are not accepted after the beginning of the subscription year. Duplicate orders or orders made in error may be returned as long as the books are in good, salable condition.

All prices are quoted and should be remitted in U.S. dollars.

### SHIPPING

Surface mail shipping costs are included in the prices stated. If faster shipment is requested, the additional cost will be charged to the customer, as will customs, tariffs or other specialized charges.

# ENGINEERING INFORMATION'S PRODUCTS AND SERVICES

## PRINT AND MICROFILM MEDIA

- *The Engineering Index<sup>R</sup> Monthly*—A monthly compilation of abstracts with an author index and subject index covering the journal and conference literature of engineering and related technical disciplines. Each issue contains indexed and classified abstracts of approximately 12,000 articles from some journals representing the world's professional periodical, conference, technical report and monograph literature.
- *The Engineering Index<sup>R</sup> Annual*—A casebound cumulative edition of each year's *The Engineering Index Monthly* issues, with subject, author and affiliation indexes, and other features, containing over 120,000 abstracts in recent editions. Back issues are available in print from 1959 and in microfilm from 1884. About 3.7 million records have been published in *The Engineering Index* since 1884.
- *The Engineering Index<sup>R</sup> Cumulative Index 1973–1977, 1978–1981, 1982–1984 and 1985–1987* are subject and author indexes to the content of *The Engineering Index Annual* and *Monthly* for the specified periods.
- *The Engineering Index<sup>R</sup> Energy Abstracts*—A specialized monthly publication with an author and subject index, drawn from the *Ei Monthly*, covering the literature of conventional and alternative energy sources. A cumulative Annual Subject Index is also provided.
- *The Engineering Index<sup>R</sup> Bioengineering and Biotechnology Abstracts*—A specialized monthly publication with an author and subject index, drawn from the *Ei Monthly*, covering bioengineering, biomedical and biotechnology engineering literature. A cumulative Annual Subject Index is also provided.
- *Engineering & Industrial Software Directory*—An annual directory featuring publicly available software for engineering and related applications. Five indexes—subject, vendor, hardware, operating system and program name—pinpoint the engineering software packages required.
- *Ei's SHE: Subject Headings for Engineering*—An alphabetical listing of the controlled vocabulary subject terms used in the indexing of Ei's products.
- *Ei's PIE: Publications Indexed for Engineering*—Lists all serial and other source publications reviewed and indexed during the year. Published annually.
- *Ei's Database Search Manual*—Includes detailed sections on Ei's scope and coverage, explanation of each Ei database data element, general searching tips and specific information on the vendors that make access publicly available.
- *Ei's Engineering (CAL) Classification Codes*—A list and description of the classification codes used for broad subject indexing.
- *Ei's 1987 Subject Index*—A cumulated list of controlled vocabulary and free language terms, with title entries and accession numbers referring to the abstracts in both the 1988 *Engineering Index Annual* and *Engineering Index Monthly*.

---

*The Engineering Index*, COMPENDEX, COMPENDEX\*PLUS, and Ei ENGINEERING MEETINGS are registered trademarks of Engineering Information, Inc.

## ELECTRONIC MEDIA

- COMPENDEX<sup>R</sup>\*PLUS is the machine-readable version of *The Engineering Index*<sup>R</sup>. It contains both journal and conference literature. It is currently available on subscription or by online or batch searching and retrieval through several public computer utility systems worldwide. It is available for license or lease from Ei. Backfiles are available back to 1982, representing the merged COMPENDEX<sup>R</sup> and Ei ENGINEERING MEETINGS<sup>R</sup> databases.
- COMPENDEX<sup>R</sup> (COMPUterized ENgineering INDEX) is the machine-readable version of *The Engineering Index*<sup>R</sup> coverage of the journal literature. It is currently available online or via batch searching and retrieval through a number of public computer utility systems worldwide. COMPENDEX digital backfiles are available on magnetic tape and other media from 1970. The cumulative digital backfile includes more than 2 million records.
- Ei ENGINEERING MEETINGS<sup>R</sup> is the machine-readable version of the coverage of the conference literature found in *The Engineering Index*. Ei ENGINEERING MEETINGS is internationally available through public computer utility systems. The digital backfile of this database is available from 1982 and covers over 498,000 records.
- ENGINEERING & INDUSTRIAL SOFTWARE DIRECTORY database, Ei's digital form of the *Engineering & Industrial Software Directory*, provides comprehensive descriptions of publicly available computer software packages for all types of engineering applications. The database currently covers 5500 programs from approximately 1,000 vendors, and is updated semi-annually. The ENGINEERING & INDUSTRIAL SOFTWARE DIRECTORY is available by subscription from Ei, and via online or batch searching from various public computer utility systems.

COMPENDEX\*PLUS, Ei ENGINEERING MEETINGS, COMPENDEX and the ENGINEERING & INDUSTRIAL SOFTWARE DIRECTORY databases are available to subscribers on an annual lease or license basis. The lease agreement permits an organization to acquire the databases for use on an in-house computer system. The license agreement allows organizations to acquire the databases and subsequently offer them for public access. The license agreement is employed by the public computer utility systems cited below. In addition to annual acquisition fees associated with lease and license agreements, Ei derives royalty revenues from the computer utility systems based on the volume of online usage of its databases. Customized subsets of any of the databases are also available on an annual lease or license basis.

The following public computer systems offer online and/or batch searches of Ei's databases in 1989. Contact the individual vendor for details on database availability, prices and terms.

BRS Information Technologies (USA)

CAN/OLE-CAN/SDI(Canada)

CEDOCAR (Centre de Documentation de L'Armement)(France)

Data-Star (USA & UK)

DIALOG Information Services (USA & UK)<sup>1</sup>

ESA-IRS (European Space Agency—Information Retrieval Service)(Italy)

ORBIT Search Service (USA)

STN International (The Scientific & Technical Information Network)(USA, West Germany & Japan)

Note: (1) The ENGINEERING LITERATURE INDEX of COMPENDEX is available evenings and weekends through DIALOG Information Services Knowledge Index System.

# Acronyms, Initials and Abbreviations of Organization Names

The following list is presented to assist the user in identifying the organizations cited by acronym, by initials, or by abbreviation in the current publications of Engineering Information, Inc.

AACE	American Association of Cost Engineers	CDA	Copper Development Association
ACM	Association for Computing Machinery	CEA	Commissariat a l'Energie Atomique (Fr)
ACS	American Chemical Society	CEGB	Central Electricity Generating Board (UK)
AEC	Atomic Energy Commission (US)	CEN	Centre d'Etudes Nucleaires
AECL	Atomic Energy of Canada Limited	CERN	Organisation Europeenne pour la Recherche Nucleaire
AEG	Allgemeine Elektrizitaets Gesellschaft		
AEI	Associated Electrical Industries		
AERE	Atomic Energy Research Establishment (of UKAEA)	CIB	Conseil Europeen pour la Recherche Nucleaire
AFB	Air Force Base		
AFIPS	American Federation of Information Processing Societies	CIBA	Conseil International du Batiment pour la Recherche, l'Etude et la Documentation
AFS	American Foundrymen's Society	CIGRE	Chemical Industry in Basel
AGARD	Advisory Group for Aerospace Research and Development		
AGEN	Arbeitsgemeinschaft fuer Elektrische Nachrichtentechnik der Stiftung Hasler-Werke, Bern	CIM	Conference Internationale de Grands Reseaux Electriques a Haute Tension
		CIRP	Canadian Institute of Mining and Metallurgy
AGMA	American Gear Manufacturers Association	CMERI	College International pour l'Etude Scientifique des Techniques de Production Mecanique
AIA	American Institute of Architects		
AIAA	American Institute of Aeronautics and Astronautics	CNEA	Comision Nacional de Energia Atomica (Argent)
AICHe	American Institute of Chemical Engineers	CNEN	Comitato Nazionale per l'Energia Nucleare (Italy)
AIIE	American Institute of Industrial Engineers	CNET	Centre National d'Etudes de Telecommunications (Fr)
AIME	American Institute of Mining, Metallurgical and Petroleum Engineers		
AIP	American Institute of Physics	CNR	Consiglio Nazionale delle Ricerche (Italy)
AISC	American Institute of Steel Construction	CNRS	Centre National de la Recherche Scientifique
AISI	American Iron and Steel Institute	COMSAT	Communications Satellite Corporation
Alcoa	Aluminum Company of America	CONICET	Consejo Nacional de Investigaciones Cientificas y Tecnicas (Argent)
ANS	American Nuclear Society		
ANSI	American National Standards Institute	CPPA	Canadian Pulp and Paper Association
APCA	Air Pollution Control Association	CRM	Centre de Recherches Metallurgiques
API	American Petroleum Institute	CSIC	Consejo Superior de Investigaciones Cientificas (Spain)
APICS	American Production and Inventory Control Society		
ARCO	Atlantic Richfield Company	CSIR	Council of Scientific and Industrial Research (S Afr)
ASAE	American Society of Agricultural Engineers	CSIRO	Commonwealth Scientific and Industrial Research Organisation (Aust)
ASCE	American Society of Civil Engineers		
ASEA	Allmanna Svenska Elektriska Aktiebolaget	DEW	Deutsche Edelstahlwerke Aktiengesellschaft
ASEE	American Society for Engineering Education	DFVLR	Deutsche Forschungsanstalt und Versuchsanstalt fuer Luft- und Raumfahrt
ASHRAE	American Society of Heating, Refrigerating and Air-Conditioning Engineers		
		DOE	Department of Energy (US)
ASIS	American Society for Information Science	DOT	Department of Transportation (US)
ASLE	American Society of Lubrication Engineers	DuPont	E. I. Du Pont de Nemours and Company
ASM	American Society for Metals	EBU	European Broadcasting Union
ASME	American Society of Mechanical Engineers	EG&G	Edgerton, Germeshausen and Grier Incorporated
ASNE	American Society of Naval Engineers	EIA	Electronic Industries Association
ASQC	American Society for Quality Control	EPA	Environmental Protection Agency (US)
ASTM	American Society for Testing and Materials	EPRI	Electric Power Research Institute
AT&T	American Telephone and Telegraph Company	ERA	Electrical Research Association
AVS	American Vacuum Society	ERDA	Energy Research and Development Administration (US)
AWS	American Welding Society		
AWWA	American Water Works Association	ESA	European Space Agency
BARC	Bhabha Atomic Research Centre	ESL	Engineering Societies Library
BASF	Badische Anilin und Soda Fabrik	ETH	Eidgenoessische Technische Hochschule (Swiss Federal Institute of Technology)
BBC	British Broadcasting Corporation		
BCIRA	British Cast Iron Research Association	EURATOM	European Atomic Energy Community
BCURA	British Coal Utilization Research Association	FAA	Federal Aviation Administration (US)
BHP	Broken Hill Proprietary	FAO	Food and Agricultural Organization of the United Nations
BHRA	British Hydromechanics Research Association		
BISRA	British Iron and Steel Research Association	FDA	Food and Drug Administration (US)
BP	British Petroleum Company	FEA	Federal Energy Administration (US)
BPO	British Post Office	Fermilab	Fermi National Accelerator Laboratory (US)
CANMET	Canadian Center for Mineral and Energy Technology	FIAT	Fabbrica Italiana Automobile, Torino
CASI	Canadian Aeronautics and Space Institute	FMC	Food Machinery Corporation
		FOM	Stichting voor Fundamenteel Onderzoek de Materie (Neth)

E	General Electric Company	NSF	National Science Foundation (US)
EC	General Electric Company Limited (UK)	NSTL	National Space Technology Laboratory
EM	General Motors	NTG	Nachrichtentechnische Gesellschaft
PO	Government Printing Office (US)	NTIS	National Technical Information Service (US)
TE	General Telephone and Electronics	NTT	Nippon Telegraph and Telephone Public Corporation
MSO	Her Majesty's Stationery Office (UK)	OCLC	Online Computer Library Center Incorporated
AEA	International Atomic Energy Agency	OECD	Organization for Economic Cooperation and Development
BM	International Business Machines Corporation	OMIKK	Országos Muszaki Információs Központ és Könyvtár (National Technical Information Centre and Library, Budapest, Hung)
CE	Institution of Civil Engineers (UK)	ORSTOM	Office de la Recherche Scientifique et Technique Outre-Mer
CHCA	International Cargo Handling Coordination Association	PCA	Portland Cement Association
CSU	International Council of Scientific Unions	PPG Ind Inc	Pittsburgh Plate Glass Industries Incorporated
DIEM	Instituto de Investigaciones y Ensayos de Materiales (Chile)	PTT	Postes, Telegraphes et Telephones
EC	International Electrotechnical Commission	RCA	Radio Corporation of America
EE	Institution of Electrical Engineers (UK)	RILEM	Reunion Internationale des Laboratoires d'Essais et de Recherches sur les Matériaux et les Constructions
EEE	Institute of Electrical and Electronics Engineers	RWTH	Rheinisch-Westfälische Technische Hochschule Aachen

# Abbreviations, Units and Acronyms

The following list is presented to assist the user in identifying the meaning of some of the abbreviations, units, symbols or acronyms appearing in the products and services of Engineering Information, Inc.

A	degree Absolute	bpsd	barrels per stream day
Å	Angstrom	BS	British Standard
abs	absolute	Btu	British thermal unit
ABS	acrylonitrile-butadiene-styrene	bu	bushel
ac	alternating current	BWR	boiling water reactor
ADP	ammonium dihydrogen phosphate		
ADP	automatic data processing	C	capacitance
AF	audio frequency	C	degree Centigrade, Celsius
afc	automatic frequency control	CA	cellulose acetate
agc	automatic gain control	cal	calorie
AGR	advanced gas cooled reactor	CATV	community antenna television, cable television
ALGOL	algorithmic language	cc	cubic centimeter
ALS	aircraft landing system	cd	candela
am	amplitude modulation	cf	cubic feet per day
amp	ampere	cfhr	cubic feet per hour
amp hr	ampere hour	cfm	cubic feet per minute
antilog	antilogarithm	cfs	cubic feet per second
ASWG	American steel wire gage	cgs	centimeter-gram-second
ATC	air traffic control	Ci	curie
atm	atmosphere	CI	compression ignition
at. %	atomic percent	cm	centimeter
at. wt	atomic weight	cmil	circular mil
AU	astronomical unit	CN	cellulose nitrate
avc	automatic volume control	CN	cetane number
avdp	avoirduois	COBOL	common business oriented language
avg	average	COD	chemical oxygen demand
		colog	cologarithm
B	magnetic flux density	COMSAT	communications satellite
b	barn	cos	cosine
bbl	barrel	cosh	hyperbolic cosine
bcc	body centered cubic	cot	cotangent
Be	Baume	coul	Coulomb
Bev	billion electron volt	cp	candlepower
bfo	beat frequency oscillator	CPM	critical path method
Bhn	Brinell hardness number	cps	cycles per second
bhp	brake horsepower	c to c	center to center
bhp-hr	brake horsepower-hour	CTOL	conventional takeoff and landing
bil	basic insulation level	cu	cubic
bit	binary digit	*cu ft	cubic foot
bmep	brake mean effective pressure	cu in	cubic inch
bod	biochemical oxygen demand	cu m	cubic meter
BOF	basic oxygen furnace	cusec, cfs	cubic feet per second
bp	between perpendiculars	cu yd	cubic yard
bp	boiling point	cw	continuous wave
bpd	barrels per day	cyl	cylinder
bpi	bits per inch		

DAP	diallyl phthalate	fm	frequency modulation
db	decibel	FORTAN	formula translation
dba	decibels adjusted	fp	freezing point
dbm	decibels referred to 1 mw	fpm	feet per minute
dbv	decibels referred to 1 v	fps	feet per second
dc	direct current	fps	foot-pound-second
DDT	dichlorodiphenyltrichloroethane	FRP	fiberglass reinforced plastic
deg	degrees (angle)	FSK	frequency shift keying
DEW	distant early warning	ft	foot
df	direction finder	ft-c	foot-candle
dia, diam	diameter	ft-l	foot-lambert
dkm	dekameter	ft-lb	foot-pound
dm	decimeter	FWHM	full wave at half maximum
DME	distance measuring equipment	FWP	fiber wound plastics
doz	dozen		
dpdt	double pole double throw	g	gram
dph	diamond pyramid hardness	g	gravitational acceleration
dpst	double pole single throw	G	gauss
DTA	differential thermal analysis	gal	gallon
dwc	deadweight capacity	GCA	ground controlled approach
dwt	deadweight	GCFR	gas cooled fast reactor
		GEM	ground effect machines
EBR	experimental breeder reactor	Gev	gigaelectron volts
EBWR	experimental boiling water reactor	GEV	ground effect vehicles
ECG	electrocardiogram	GFRP	glass fiber reinforced plastic
ECG	electrochemical grinding	GHz	gigahertz
ECM	electrochemical machining	gpd	gallons per day
EDM	electrical discharge machining	gph	gallons per hour
EDP	electronic data processing	gpm	gallons per minute
EDT	ethylenediamine tartrate	gps	gallons per second
EDTA	ethylenediaminetetra-acetic acid	GRP	glass reinforced plastics
EEG	electroencephalogram	GVW	gross vehicle weight
EEM	electron emission microscope	Gw	gigawatt
ehp	effective horsepower	Gwhr	gigawatt-hour
ehv	extra high voltage		
ELF	extra low frequency	h	henry
ELG	electrolytic grinding	H	magnetic field strength
EMC	electromagnetic compatibility	hcp	hexagonal close packed
emf	electromotive force	HDPE	high density polyethylene
emi	electromagnetic interference	hf	high frequency
emu	electromagnetic units	hp	horsepower
EPR	electron paramagnetic resonance	h-p	high pressure
EPR	ethylene propylene rubber	hp hr	horsepower hour
ERP	effective radiated power	hr	hour
ESM	electron scanning microscope	HSS	high speed steel
ESR	electron spin resonance	ht	high tension
esu	electrostatic units	HTGR	high temperature gas cooled reactor
ev	electron volt	HTHW	high temperature hot water
		hv	high voltage
f	farad	Hz	hertz
F	degree Fahrenheit		
fbm	foot board measure (boardfeet)		
fcc	face centered cubic	IC	integrated circuit
FET	field effect transistor	IC	internal combustion
fl oz	fluid ounce	ICBM	intercontinental ballistic missile

icw	interrupted continuous wave	L-C	inductance capacitance
ID	inside diameter	LCL	less than carload lots
if	intermediate frequency	L/D	lift/drag ratio
IGY	International Geophysical Year	lf	low frequency
ihp	indicated horsepower	lm	lumen
ihp-hr	indicated horsepower-hour	LMG	liquefied methane gas
ILS	instrument landing system	ln	natural logarithm
impd	impedance	LNG	liquefied natural gas
in.	inch	log	logarithm
ipm	inches per minute	long.	longitude
ips	inches per second	LOX	liquid oxygen
IR	infrared	l-p	low pressure
IRBM	intermediate range ballistic missile	LPG	liquefied petroleum gas
I-V	current-voltage	LPG	liquefied propane gas
		lv	low voltage

Mp	megapond	PERT	program evaluation and review technique
MPD	magnetoplasmdynamic	PETN	pentaerythritol tetranitrate
mph	miles per hour	pf	picofarad
mr	milliroentgen	pf	power factor
Mrad	megarad	PFM	pulse frequency modulation
msec	millisecond	pH	hydrogen ion concentration
MTI	moving target indicator	p-i-n	positive-intrinsic-negative (junctions)
MTR	materials testing reactor	PM	phase modulation
MUF	Maximum usable frequency	PM	powder metallurgy
mv	millivolt	PM	pulse modulation
Mv	megavolt	PMMA	polymethyl methacrylate
Mva	megavolt-ampere	p-n	positive-negative (junctions)
mw	milliwatt	p-n-p	positive-negative-positive (junctions)
Mw	megawatt	PP	polypropylene
Mwd	megawatt day		
MWD	molecular weight distribution	ppb	parts per billion
Mwe	megawatts electrical	PPI	plan position indicator
Mwt	megawatts thermal	ppm	parts per million
μ	millimicron	PPO	polyphenylene oxide
		pps	pulses per second
N	newton	PRF	pulse repetition frequency
N	normal concentration	PS	polystyrene
NBR	nitrile butadiene rubber	psec	picosecond
NC	nitrocellulose	psf	pounds per square foot
N/C	numerical control	psi	pounds per square inch
NDI	nondestructive inspection	psia	pounds per square inch absolute
NDT	nondestructive testing	psig	pounds per square inch gage
nm	nanometer	PSK	phase shift keying
nmi	nautical mile	PSWR	power standing wave ratio
NMR	nuclear magnetic resonance	PTFE	polytetrafluoroethylene
n-p-n	negative-positive-negative (junctions)	PVA	polyvinyl alcohol
NPSH	net positive suction head	PVC	polyvinyl chloride
nsec	nanosecond	PVF	polyvinyl fluoride
NTP	normal temperature and pressure	pvt	pressure volume temperature
nv	neutron flux	PWR	pressurized water reactor
nvt	total integrated neutron flux		
		QC	quality control
oa	overall	qt	quart
od	outside diameter		
oe	oersted	R	degree Rankine, Reaumur
OFHC	oxygen free high conductivity copper	R	resistance

rad	radian	swg	standard wire gage
rad	radiation dose	SWR	standing wave ratio
R	Rockwell hardness (subscript according to scale, e.g., s.b.: R <sub>C</sub> )	sync	synchronization
r	roentgen		
RC	resistance capacitance	t	ton
R & D	research and development	T	Tesla
RDX	cyclotrimethylene trinitramine	tan	tangent
Re	Reynolds number	tanh	hyperbolic tangent
RE	rare earth	tdw	total deadweight
reac	reactance	TE	transverse electric
rem	roentgen equivalent man	TEL	tetraethyl lead
rep	roentgen equivalent physical	TEM	transverse electromagnetic
rf	radio frequency	TEP	thermoelectric power
RH	relative humidity	TFE	tetrafluoroethylene
RIV	radio influence voltage	TFT	thin film transistor
'R-L-C	resistance-inductance-capacitance	TGA	thermogravimetric analysis
rms	root mean square	THz	terahertz
rpm	revolutions per minute	THTR	thorium high temperature reactor
rps	revolutions per second	TIG	tungsten inert gas
		TM	transverse magnetic
SBR	styrene butadiene rubber	TNT	trinitrotoluene
scf	standard cubic feet	tonf	tons force
scfm	standard cubic feet per minute	TPA	terephthalic acid
SCR	silicon controlled rectifier	tpd	tons per day
sec	secant	tph	tons per hour
sec	second	TR	transmitter-receiver
SGHWR	steam generating heavy water reactor	trf	tuned radio frequency
shp	shaft horsepower	TTT	time-temperature-transformation
sin	sine	TV	television
sinh	hyperbolic sine	TWT	traveling wave tube
SMS	semiconductor-metal-semiconductor	TWX	teletype exchange
SNAP	system for nuclear auxiliary power		
snr	signal-to-noise ratio		
sp gr	specific gravity	UHF	ultra-high frequency
spdt	single pole double throw	uhv	ultra high voltage
SPL	sound pressure level	UHV	ultra high vacuum
spst	single pole single throw	ULF	ultra low frequency
sq	square	UV	ultraviolet
sq cm	square centimeter		
sq ft	square foot		
sq in.	square inch	v	volt
sq m	square meter	va	volt ampere
sq mi	square mile	var	volt-ampere reactive
SQC	statistical quality control	vers	verse sine
sr	steradian	vf	voice frequency
SR	silicone rubber	Vh	Vickers hardness
SSB	single sideband	VHF	very high frequency
SST	supersonic transport	V-I	voltage-current
SSU	Saybolt seconds universal	VLF	very low frequency
STOL	short takeoff and landing	vol%	volume percent
STP	standard temperature and pressure	VOR	VHF omnidirectional radio range
SW	short wave	VSWR	voltage standing wave ratio

VTOL	vertical takeoff and landing	wpm	words per minute
VTR	video tape recording	wt%	weight percent
VTVM	vacuum tube voltmeter		
vu	volume unit	YAG	yttrium aluminum garnet
		yd	yard
w	watt	YIG	yttrium iron garnet
Wb	weber	yr	year
wg	water gage		
whr	watt-hour	°	degree (angle)
wk	week	/	per

**Directional** See Also OIL WELL COMPLETION—Offshore Operations; OIL WELL PRODUCTION—Enhanced Recovery.

**072809 DIRECTIONAL DRILLING; THE STATE OF THE ART.** The economics of oil recovery have dictated the necessity of controlled directional drilling, and today it is no longer the dreaded operation that it once was. It is an accepted function of the industry. The most important aspect of controlled directional drilling is that it enables oil producers to develop reservoirs that could not be reached economically in any other way.

Bakke, Steiner (North Sea Drilling Services Ltd, Aberdeen, Scotl). *Q J Tech Pap Inst Pet* Jan-Mar 1986 p 49-54.

**072810 EFFECT OF THE ANGLE OF INCLINATION OF A WELL ON THE READINGS OF A PROFILOMETER.** Even well inclination angles that are not very large ( $\leq 12^\circ$ ) are capable of greatly affecting the nature of profilograms given a stably positioned two-plane well instrument in an inclined well, the larger of its readings is equal to the actual well diameter. For accurate calculation of the volume of a well it is recommended that profilometry be carried out in the well with a single profilometer twice in succession. By so doing, zones of unstable positioning of the instrument on one profilogram are overlapped by intervals of stable positioning on the other, which makes it possible to determine the true shaft diameter as a function of depth with sufficient accuracy. In Russian. 4 refs.

Tavanets, A.I. *Neft Khoz* n 5 Mar 1987 p 17-20.

**072811 DESIGNING WELL PATHS TO REDUCE DRAG AND TORQUE.** A deviated well with an undersection trajectory (i.e., a trajectory lying below the conventional tangent section and constantly building to target) can exhibit lower drag and torque than a conventional well geometry in certain circumstances. The influence of well geometry on drag and torque is discussed, making use of the results of the theoretical model. Although an undersection well may have a reduced overall drag, the side forces in the drill collars will be increased. This can lead to a greater danger of sticking in the bottomhole assembly (BHA). Furthermore, because of the enhanced side forces near the bit, an undersection well may also exhibit greater torque. (Edited author abstract) 3 refs.

Sheppard, M.C. (Schlumberger Cambridge Research); Wick, C.; Burgess, T. *SPE Drill Eng* v 2 n 4 Dec 1987 SPE 15463, p 344-350.

**072812 CONTROLLED DIRECTIONAL DRILLING AS A TOOL OF THE OFFSHORE INDUSTRY.** This article gives an introduction to the basic principles of directional drilling. A new application for directional drilling is Drainhole Drilling. To drill a drainhole means to drill a long section of a well inside the reservoir to increase the productivity. Offshore directional drilling is discussed from the viewpoint of technological advances. A discussion is also presented of borehole surveying and the two basic principles used to determine borehole position. Steering Tools and gyroscopic survey tools are briefly examined.

Kinzel, Holger. *Mar Technol* v 17 n 1 Feb 1986 p 29-31.

**072813 SLANT-HOLE DRILLING FINDS EXPANDING ROLE IN CANADA.** Slant-hole drilling is a method for achieving horizontal displacement at shallow depths to access targets that could not be reached by conventional directional drilling. This article focuses on two projects in western Canada where Sierra acted as drilling contractor. One project was a multiwell drilling program for a drill pad and the other project was a gas well drilled with an extreme horizontal well bore displacement. Steerable downhole motors were used for directional drilling. The motors were oriented to build and maintain drift angle, as well as make minor azimuth adjustments. When both the angle and direction requirements were met to achieve target parameters, the drill string was rotated slowly to negate the effects of the motor's deflecting action. Because BP Canada drilled the

wells from a multiwell drilling pad, the company opted for a central mud system to improve the project's overall economics.

Edwards, R.D. (Sierra Drilling Ltd, Edmonton, Alberta, Can); Strelkov, George. *Pet Eng Int* v 60 n 2 Feb 1988 p 20, 22-23.

**072814 HORIZONTAL-WELL DRILLING DATA ENHANCE RESERVOIR APPRAISAL.** Based on the examples covered in this concluding article of the seven-part series on horizontal well operations it appears that the very perception of the reservoir characteristics and heterogeneities are modified when a well is drilled horizontally. The lateral evolution of the facies, the fractured zones, and the irregularities of the top and bottom of the reservoir are all directly encountered. On the other hand, vertical characterization is more problematic, and will require a new type of logging that enables deep investigation above and below the horizontal well. Elf Aquitaine's horizontal wells in the Lacq and Castera Lou fields were primarily aimed at learning how to drill horizontally. After these tests, the Rospo Mare field was drilled and put into production with horizontal wells. 1 Ref.

de Montigny, Olivier (Elf Aquitaine, Pau, Fr); Sorriaux, Patrick; Louis, Alain J.P.; Lessi, Jacques. *Oil Gas J* v 86 n 27 Jul 4 1988 p 40-48.

**072815 APPLICATION OF RECENTLY DEVELOPED MEDIUM-CURVATURE HORIZONTAL-DRILLING TECHNOLOGY IN THE SPRABERRY TREND AREA.** Recently developed horizontal-drilling techniques have been applied the Spraberry trend area in Midland County, TX. The desired application includes drilling horizontally at a right angle to the naturally occurring vertical fractures in one of three Spraberry zones. The result was 1,180 ft of vertical section within 10° of the planned azimuth of 115°. The W.M. Schrock 38 No. 7 was drilled vertically to 8,620 ft [2627 m] through the Upper Spraberry, Lower Spraberry, and Dean formations. After openhole-log evaluation, the decision was made to attempt horizontal-drilling operations in the lower Spraberry. Seven-inch casing was set 342 ft above the horizontal target of 7,889-ft true vertical depth (TVD), and a cement plug was set and dressed to 7,567-ft TVD. After the curved portion of the hole had been drilled 3- and 1°/100-ft [ $1.7 \times 10^{-3}$  and  $0.57 \times 10^{-3}$  rad/m] motors were used in both rotational and orienting modes to maintain an inclination near 90° and an azimuth of about 115°. During drilling at 8,598-ft measured depth (MD), the motor parted and a fishing job in the near-horizontal portion of the wellbore resulted. The motor and bit were successfully retrieved on the first attempt. (Edited author abstract). 1 Ref.

**072816 EXPERIMENTAL AND THEORETICAL STUDY OF A COUPLING MECHANISM BETWEEN LONGITUDINAL AND TORSIONAL DRILLSTRING VIBRATIONS AT THE BIT.** A mechanism that couples longitudinal and torsional drillstring vibrations at the bit was studied. Torsional vibrations are associated with dynamic variations of the rotational bit speed. When a roller bit runs over a multilobed pattern, these speed variations have been shown to affect the input of longitudinal vibrations. The theory for this coupling mechanism is verified experimentally by high-rate data of near-bit accelerations and torque recorded in a 1000-m [3280-ft]-deep well. (Author abstract) 9 refs.

**072817 REVERSED BENDING FATIGUE STRENGTH OF DRILL STRINGS SUBJECT TO**

**THE ATTACK OF DRILLING FLUIDS.** Under normal service conditions, drill pipes are frequently exposed to reverse bending stresses. In addition to mechanical loads, corrosion is generated by the circulating medium, which may lead to corrosion fatigue cracking. The paper describes reverse bending fatigue tests on small specimens in order to determine the fatigue strength characteristics. Although small specimens are usually tested at high frequencies, the test series described also includes tests with low load frequencies of 100 min<sup>-1</sup>. The results contain data on nearly all available material grades according to API and give strength characteristics for practical application. (Edited author abstract) 6 refs.

**072818 DESIGN, TESTING, AND PLANNING CONSIDERATIONS FOR A 20-IN. RECORD CASING STRING.** During May 1984, a total of 12,455 ft [3800 m] of 20-in., 169-lbf/ft [51-cm, 2.47-N/m] C-95 casing was successfully run and cemented to the surface in L. W. Magoun No. 1, Concordia Parish, LA. The string consisted of 303 joints and required 49 hours to run. The casing weight in 9.7-lbm/gal [1162-kg/m<sup>3</sup>] mud was  $1.8 \times 10^6$  lbm [826 Mg]. This paper discusses the engineering, operational planning, and job execution for this world-record string of 20-in. [51-cm] casing. The topics include casing design, manufacturing, connection testing, and running and cementing procedures. (Author abstract). 3 Refs.

**072820 CORROSION INVESTIGATION OF DRILLING PIPE IN VARIOUS CONCENTRATIONS OF SALT MIXTURE WITH AND WITHOUT ADDING MUD AT DIFFERENT TEMPERATURES.** In order to evaluate the effect of mud on drilling pipe corrosion in the presence of different salt mixtures, Cl<sup>-</sup>, SO<sub>4</sub><sup>2-</sup> and HCO<sub>3</sub><sup>-</sup>, different concentrations of salts were used and different temperatures were applied. Addition of mud improved corrosion inhibition only at moderate temperatures 20 and 40°C because the mud composition contained a considerable quantity of sulfate, but at temperatures over 60°C mud had the capability of reducing the sulfate to sulfide and severe attack would occur. (Edited author abstract). 12 Refs.

**072823 MUD FILTRATE EFFECTS ON THE LATEROLOG IN ALBERTA FOOTHILLS CARBONATES.** This report proposes a new set of invasion correction curves for the laterolog that can be used quantitatively for a variety of mud systems and various diameters of invasion to obtain the true resistivity of the formation. The Resistivity Index (I) was used to develop new invasion corrections. By assigning an I value to each of the flushed, transition and uninvaded zones and establishing the resistivity contribution of each zone to the laterolog reading from published pseudo-geometrical factors, invasion corrections were determined. Open-hole logs of actual field cases are used to demonstrate the invasion corrections for the laterolog. The proposed corrections have resulted in the calculation of more accurate water saturations as substantiated by production test results. (Edited author abstract) 14 refs.

**072825 USE OF POTASSIUM/LIME DRILLING-FLUID SYSTEM IN NAVARIN BASIN DRILLING.** This paper presents a case history of Amoco Production Co.'s use of potassium-lime mud (KLM) for drilling a series of wells in the Navarin basin. The remote location, logistical concerns, environmental regulations, and the high cost of the operation mandated that the project be carefully planned. This paper describes the planning, implementation, and results of the mud system used to drill the wells. It includes a matrix of tests used to define further the nature of KLM, presents the methods used to run the system while the wells were drilled, and describes the results of using the mud in the basin. Navarin basin experience suggested that KLM should be considered when clay inhibition is needed and moderate bottomhole temperatures (BHT's) are expected. (Edited author abstract) 12 refs.

**072828 DELTA FLOW: AN ACCURATE, RELIABLE SYSTEM FOR DETECTING KICKS AND LOSS OF CIRCULATION DURING DRILLING.** A system to monitor drilling-fluid flow rate has been developed that detects kicks and lost returns in floating, fixed-platform, and land-based drilling operations. The system uses flowmeters that monitor the flow rates of drilling fluids entering the borehole through the standpipe and leaving the well through the return flowline. These readings are processed in a computer-based, data-acquisition system to form a filtered delta-flow signal that identifies the occurrence of downhole fluid gains or losses. The system is designed to trip an alarm when a gain or loss exceeds 25 gal/min [ $1.6 \text{ dm}^3/\text{s}$ ], even in a floating drilling environment. (Edited author abstract) 2 refs.

**072829 TOXICITY OF SEDIMENT-INCORPORATED DRILLING FLUIDS.** The 24, 96, or 168h  $\text{LC}_{50}$ s of four used drilling fluids or barite incorporated into sediment were determined in toxicity tests with lancelets (*Branchiostoma caribaeum*), a benthic chordate. Concurrent  $\text{LC}_{50}$  determinations,  $\text{EC}_{50}$ s were calculated from the number of lancelets that did not burrow into contaminated sediments. Observations of the burrowing behavior allowed quantitation of effects after 24h exposures to each of the drilling fluids whereas lancelet mortality was sufficient to calculate 24h  $\text{LC}_{50}$ s for only one drilling fluid. Drilling fluids were less toxic to lancelets when incorporated into sediments than to mysids (*Mysidopsis bahia*) or benthic invertebrate communities in water-column exposures. (Author abstract) 14 refs.

**072830 STUDY OF THE STATE OF THE BOTTOM-HOLE AREA OF TERRIGENOUS FORMATIONS.** In many wells it is not possible to solve the problem of the presence of infiltration and clogging zones unequivocally from the results of widely used geophysical exploratory methods. The depth of the zone of infiltration of the rinsing fluid filtrate depends in a complex way on the time of contact between the formation and the drilling solution and on the porosity of the formation. The number of formations with a clogging zone increases with an increase in porosity, cracking and depth of occurrence. In addition, a dependence of the clogging zone on the stress state of the well walls and the strength properties of the collector is observed. In Russian. 7 refs.

Khomins, Z.D. *Neft Khoz* n 7 Jul 1987 p 18-22.

**072831 CHARACTERIZATION OF DRILLING MUD FLUID INVASION.** A method for the characterization of drilling mud fluid invasion of porous formations was developed. The oil saturation and resistivity profiles are determined as a function of radial distance from the well and time using a finite difference solution of the radial form of the diffusivity equation. The coefficient of dispersion and its variation with respect to time was determined for five sandstones using long cores. The effluent profile of a step increase of injected sodium chloride concentration is analyzed to determine the value of the coefficient. Values reported in the literature for the dependence of the mud filtration rate on time of filtration were used. The method gives a complete analysis of mud filtrate invasion and can be used for improvement of resistivity well log interpretation. (Author abstract) 14 refs.

**072833 DRILLING PROVES KLM SYSTEM WELL-SUITED FOR GULF OF MEXICO'S GREEN CANYON.** A carefully monitored four-well program in the Green Canyon area of the Gulf of Mexico revealed the advantage of a KLM mud employed in the final three wells. This is the second in a series of two papers on drilling with KLM mud. The first article covered the troublesome shale characteristics of this area and other factors for selecting the drilling mud. Excellent borehole stabilization was achieved on all three of the wells drilled with the KLM system. By analyzing monitored data taken at selected depths while drilling 1 Green Canyon 108, it is possible to show that the KLM system effectively stabilized the borehole. Significant improvements in borehole stabilization were also reflected in time savings on each well that the KLM mud system was used.

**072834 INCREASING PENETRATION RATES WITH HIGH-PRESSURE MUD.** To improve penetration rates of conventional oil and gas drilling rigs by as much as 300%, a high pressure system has been developed. Heart of the system is this trailer-mounted series of pumps that generate 10 gal/minute of mud apiece at 30,000 psi. The high-pressure mud comes off the rear of the trailer through a manifold that sends it to a high-pressure pipe, inside the pipe shown at right, which takes it to the drilling rig. The high-pressure system works with all drilling fluids, but it runs them through this additional centrifuge for extra cleaning.

**072836 WILLISTON BASIN: AN ANALYSIS OF SALT DRILLING TECHNIQUES FOR BRINE-BASED DRILLING-FLUID SYSTEMS.** Williston Basin salt intervals, ranging in depth from 5000 to 12,500 ft [1525 to 3810 m], have been responsible for widespread casing collapse because of the plastic movement of evaporites and the subsequent point loading of casing. This phenomenon is attributable to poor cement jobs across excessively eroded salt sections. A 2-year study led to the realization that this erosion is a function of not only salt dissolution but also the mechanical action of turbulent flow in the wellbore. A laminar flow regime can be realized and salt enlargement limited by careful control of annular flow rate, jet velocity, and drilling-fluid rheology. (Author abstract) 11 refs.

**072839 DRILLING CEMENT WITH A POLYMER MUD.** Cement contamination of a drilling fluid occurs one or more times during the process of drilling a well. Many polymers are irrevocably altered in the presence of free calcium ions when a pH change occurs. Consequently, the free calcium must be chemically removed before the polymer molecule is altered. Of the several chemicals that can remove free calcium, sodium bicarbonate or potassium bicarbonate instead of a carbonate offers advantages. A bicarbonate will cause a rapid increase in the pH of the polymer system, but the free calcium from the lime is immediately reacted to form the precipitate calcium carbonate. This leaves the polymer unaffected by the calcium ion while the pH increases. The amount of pretreatment chemical should be determined based on the amount of lime to be reacted. Calculations are shown to determine the amount of lime to be treated.

Dorsey, Dave. *Oil Gas J* v 83 n 13 Apr 1 1985 p 128, 133.

**072840 WATER MUD GIVES ADVANTAGES WITH PCD BITS.** Operators desire a water-base mud that will yield high penetration rates without downhole trouble when used in conjunction with polycrystalline diamond (PCD) bits. A new water-mud system allows not only high penetration with PCD bits, but maintains a gage hole in the process. The new mud is marketed under the tradename Calx. Calx is a non-dispersed system that contains calcium and potassium. When used in heaving shales, it helps stabilize the well bore, aids in reducing formation damage, and base-exchanges the calcium and potassium for sodium in clay, reducing mud-making. Combined with high temperature deflocculants, which allow the system to function effectively at temperatures to 400°F., the mud permits operators to save on total well costs by replacing conventional water or oil muds in hydratable shales. The drilling fluid uses a polysaccharide as the deflocculant. It acts as a thinning agent and stops hydration of mud-making shales. No lignosulfonates are used. Mud contents are biodegradable. 1 ref.

**072841 EFFECT OF A NONCLAYEY SALT-SATURATED SOLUTION OF CARBOXYMETHYL CELLULOSE ON THE QUALITY OF DRILLING INTO PRODUCTIVE FORMATIONS.** According to field data obtained from well testing in eastern Siberia, salt-saturated solutions of carboxymethyl cellulose affect the bottom-hole area of a productive formation in different ways. Cases of partial and complete clogging of this area by the products of drilling into the formation have been noted, as well as cases of recovery and increase in its permeability, prior to well completion. These different states of the bottom-hole area prior to well completion are determined by the nature of the salinization of the rocks, the depth of penetration of the polymer into the productive formation, changes in the conditions of capillary retention of fluid in pores and capillaries of the rocks; and the occurrence of diffuse phase transitions in the solution in the zone penetrated by it. In Russian. 7 refs.

**072843 EFFECT OF A VACUUM ON THE DRILLING SOLUTION PRESSURE IN A WELL.** A study was made of the effect of a difference in the properties of the drilling solutions filling the pipe space and the annular space of a well on the bottom-hole pressure during regulation of a vacuum in the well. It was found that when the pipe and annular spaces are filled to the well mouth and hermetically sealed, the bottom-hole pressure is always less than the calculated pressure in the annular space but greater than the calculated value in the pipe space. Also, under these conditions the sum of the measured pressures at the bottom hole and at the well mouth in the pipe space is always greater than the calculated pressure in the annular space. A change in the vacuum in the annular space after stabilization of the levels in the pipe and annular spaces has no effect on the bottom-hole pressure. In Russian.

**072845 COST REDUCTION AND IMPROVEMENT OF DRILLING MUD PROPERTIES BY USING A NOVEL POLYMER.** A novel sulfonated polymer for filtration control in water based drilling fluids is described. Test results demonstrate temperature stability up to 200°C and outstanding electrolyte tolerance of the product. The polymer can be used in NaCl-saturated drilling fluids as well as in muds containing 75,000 ppm of calcium or 100,000 ppm of magnesium ions. Typical applications of this additive are presented. A combination of starch with the mud additive worked successfully in several wells drilled by Preussag AG. The deepest hole was drilled with 11-22 kg/m<sup>3</sup> of pregelatinized starch and 2.5-5.5 kg/m<sup>3</sup> of the polymer to a depth of 4500 m (BHS 133°C). Field experience up to 145°C is discussed. Also reported is a field test in which a CMC mud showing thermal degradation of the cellulosic polymer was successfully stabilized by the polymer. (Edited author abstract) 4 refs.

**072848 SOFTWARE PREDICTS MUD TOXICITY.** An expert computer system has been developed to approximate expected 'lethal concentration - 50 percent' (LC<sub>50</sub>) values based upon changes in concentrations of the drilling fluid constituents. This program, developed by M-I Drilling Fluids Co. and called ENV, is based upon hundreds of laboratory-generated bioassay values. It reduces both the cost and the time required to get an indication of the LC<sub>50</sub> value expressed as a limited range.

Anon. *Oil Gas J* v 86 n 28 Jul 11 1988 p 85-88.

**072849 DRILLING MUD EVALUATION OF SOUTHWEST QUEENSLAND WELLS.** In a study of 17 exploration and appraisal wells drilled in southwest Queensland, inclusion of all measurable mud related costs radically changed previously held beliefs on mud system cost effectiveness. The study showed a cost advantage of approximately 30 per cent when using KCl-polymer over wells drilled with gellignosulphonate. Mud product consumption cost was shown to be only part of what must be considered when evaluating the overall cost effectiveness of a drilling fluid. Evaluation of a mud system was shown to require a detailed analysis of all drilling and evaluation problems encountered during the course of drilling a well. (Edited author abstract) 1 ref.

## Economics

**072850 ECONOMICS OF CONTRACT DRILLING - A DILEMMA.** As a result of the downturn in exploration, the Australian contract drilling industry was flooded by an oversupply of rigs resulting in a reduction in rates by up to 35 per cent. This oversupply situation continues today in Australia, and contractors are now facing severe economic difficulties as they attempt to gain a reasonable market share to ensure that their nucleus of highly trained personnel are not lost from the industry. Contractors have implemented cost control programs which if continued for some time will have adverse effects. As maintenance programs have been curtailed, capital expenditure has all but been eliminated and training programs deferred. (Edited author abstract)

**072851 NORTH SEA DEVELOPMENT DRILLING, SOUTH EAST FORTIES: A CASE STUDY.** The development of the South East Forties field began in July 1984, when a 16-slot subsea template was transported to location and installed by the semisubmersible drilling vessel (SSDV) Sedco 707. Thereafter, 14 subsea development wells were drilled before the installation of a minimum-facilities jacket, to which the wells would be tied back and completed. This field development was identified as an ideal candidate for the optimization of the drilling operation. The result of this optimization campaign was a significant reduction in well-drilling times and associated costs. (Author abstract) 1 ref.

Denholm, J.M. (BP Petroleum Development Ltd). *SPE Drill Eng* v 2 n 4 Dec 1987 SPE 15448, p 387-392.

**072852 MODERN RIG DESIGN, EQUIPMENT UPS EFFICIENCY.** Increasing rig efficiency would be one way to enable the oil well drilling industry to survive. The efficiency of a drilling rig is increased when the maximum rig time is spent on bottom, making hole at optimum penetration rates. This means that one has to concentrate efforts to minimize rig moving time and increase the percentage of time making hole. This can be achieved by study of the drilling process and designing, selecting, and matching components to it.

Spoerker, Hermann F. (OMV AG, Vienna, Austria). *Oil Gas J* v 86 n 9 Feb 1988 p 51-52, 54, 56.

**072853 DOWNHOLE CONTROL OF DEVIATION WITH STEERABLE STRAIGHT-HOLE TURBO-DRILLS.** Advances in directional drilling have until recently been confined to issues that are peripheral to the central problem of controlling assembly behavior downhole. The steerable straight-hole turbodrill (SST) addresses this problem directly, allowing alteration of the well course without the need to trip. The availability of

such a system radically changes the way in which directional well planning may be approached. This paper describes the equipment used and the equipment's construction and operational requirements. It discusses the capabilities and current limitation of the systems. Field results are presented for some 300,000 ft [91,500 m] of deviated drilling carried out over 2 years in Alaska and the North Sea. A series of four highly deviated wells totaling 35,000 ft [10,700 m] with only three deviation trips is included. (Edited author abstract) 4 refs.

**072854 USE OF REAMERS FITTED WITH SUPERHARD MATERIALS IN DEEP BORING OPERATIONS.** The field of application and advantages of radial-elastic reamers over rigid reamers or fixed expanding devices is outlined and methods improving them are considered. It is noted that radial-elastic reamers and gages equipped with superhard materials have been used successfully in boring deep boreholes. The number of blades and the forces with which they are presented to the borehole walls are determined from the permissible torque [M] established, using the strength conditions of the boring column on rotary boring or determined from the torque of the face motor. An increase in  $m$  is generally accompanied by a decrease in rigidity of the flexible element under each blade and a decrease in its pressure on the borehole walls. 5 refs.

**072855 STEERABLE SYSTEM CUTS STRAIGHT HOLE DRILLING COSTS 50%.** The system comprises a bit, bent housing positive displacement motor (PDM), MWD tool, stabilization-bottomhole assembly (BHA) optimization software, and a certified operator. The steerable system drills using either the downhole motor only (sliding mode) or the motor and rotary table (rotary mode) to provide rotational power to the bit. The need to change BHAs is dramatically reduced. Trajectory corrections can be made much more frequently with less changer per correction. The steerable system drills an arc of curvature established by the degree of end in the orienting housing of the motor component of the drilling assembly and stabilizer placement. The bend tilts the bit axis relative to the axis of the hole and creates an offset angle which imparts a lateral, or side force, to the bit.

Nordquist, Darrell (Sun Exploration & Production Co, Valencia, CA, USA); Kerr, Denton; Thomas, Mark. *Pet Eng Int* v 60 n 5 May 1988 p 48-51.

**072856 ELF IMPROVES HORIZONTAL DRILLING AT ROSPO MARE.** Horizontal drilling in the Rospo Mare field, located off the shore of Italy, was enhanced with the use of a remote-controlled bent sub. This new tool allows real-time control and correction of drift angle and azimuth without round trips to modify the bottomhole assembly (BHA). The remote-controlled bent sub, called the T-3000 Telepilot, consists of an upper and lower sub connected by an offset conical swiveling joint. The axis of the conical joint is tilted compared to the main axis of the tool. Rotation of the lower sub around the axis of the swiveling joint gradually induces an increase in the bent sub angle from 0° in the straight position to a maximum angle after five actuations and then back to 0° after a complete revolution (10 actuations). Maximum bent sub angle can be 2°, 2.5°, or 3° depending on the size of the tool. The two main advantages of the remote-controlled bent sub are: Time savings - the standard drilling method would have required three additional round trips. The planned well bore trajectory was followed with greater accuracy and with the same BHA.

Mariotti, Christian (Elf Italiana, Rome, Italy); Kou, Evelyn. *Pet Eng Int* v 60 n 8 Aug 1988 3p.

## Evaluation

**072857 TOP-DRIVE DRILLING SYSTEM EVALUATION.** Three wells were drilled from a platform in Mustang Island, offshore Texas, and the top-drive drilling system was used and tracked for time savings vs. a typical kelly/rotary system. It has been reported that as much as 20 to 25% time savings can be obtained with the top drive. Definite time savings can be expected with the top-drive drilling system, but the magnitude reported was not experienced on the three wells discussed. It was established that roughly 6% of drilling cost or 4% of total well cost could be saved with the top drive, which represents 11% of drilling time or 8% of total well time. (Edited author abstract) 3 refs.

**072858 EFFECTIVE MANAGEMENT KEY TO REMOTE RIG SITE OPERATION.** Remote exploratory drilling operations generally are short-duration projects, but the organization must be developed to provide support before, during and after actual drilling. Five interrelated elements must carefully be considered when developing the organization: goals, organizational structure, decision processes, people and reward systems. Each of these five elements is discussed. In addition, such factors as relationships between participants and support services selection and approvals are also examined in detail. 1 ref.

Goldsmith, Riley (Goldsmith Engineering Inc, Houston, TX, USA). *World Oil* v 205 n 5 Nov 1987 p 55-56, 58.

**072859 IDENTIFYING POTENTIAL PETROLEUM ACCUMULATIONS.** In the course of 'tight money' exploration, explorationists are faced with further reducing the risk of the three parameters of a prospect: trap, reservoir, and the presence of hydrocarbons. Except under very favorable conditions, techniques such as seismic can only provide information on the first two. The latter parameter, the presence of hydrocarbons, has usually been relegated to proximity to production or shows. Predrilling analysis of the near-surface geochemical environment will enable the explorationist to evaluate the potential for hydrocarbon accumulations. A petroleum reservoir will leak various hydrocarbons that rise to the surface via fractures. The article describes electrical and other near-surface exploration techniques. 4 refs.

**072860 USES OF PRESSURE AND TEMPERATURE DATA IN EXPLORATION AND NEW DEVELOPMENTS IN OVERPRESSURE DETECTION.** Pressure and temperature data from wireline logs and seismic-velocity analysis can be used in deep overpressures to aid in prospect evaluation. Properly interpreted seismic-velocity analysis in deep water can yield maturation and migration information. Use of a modified approach to the  $d$  exponent and use of measurement-while-drilling (MWD) data have proved successful in deepwater pressure detection. (Author abstract) 17 refs.

## Mathematical Models

**072861 PREDICTION OF PHYSICO-MECHANICAL PROPERTIES ROCKS TO BE DRILLED BY RELYING ON THE ANALYSIS OF THE TRAJECTORIES OF DRILLED BOREHOLES.** A mathematical model of the process of deflection of inclined-directed boreholes in the course of turbine drillings is described.

An estimation of the values of the load per bit and of the frequency of its rotation is carried out taking into account turbodrill characteristics and assuming that in the course of drilling its mechanical rate is maximized. By using this model and depending on the character of the trajectories of the boreholes drilled it is possible to evaluate the physico-mechanical properties of rocks forming the log of the drilling region. (Translated author abstract) 6 refs. In Russian.

Sdobin, A.I. *Izv Vyssh Uchebn Zaved Neft Gaz* n 2 Feb 1988 p 19-22.

## Measurements

**072862 NEW METHOD OF MEASURING PENETRATION IN WELL DRILLING.** It is proposed to measure the penetration by a bit in accordance with axial load variations. This would utilize the relay character of drilling tool feeding, in which changes in axial load during the drilling with stopped tool feeding are proportionate to the penetration by the bit. Two ways of implementing the method are proposed. Experimental data are presented confirming the theoretical principles. (Translated author abstract) 2 refs. In Russian.

**072863 MEASUREMENT WHILE-DRILLING ESSENTIAL TO DRILLING.** During the next decade, measurement-while-drilling (MWD) technology will mature and become an essential part of drilling and formation evaluation. Especially in high angle/horizontal wells, more effective drilling and evaluation will be possible. This concluding article in a series that began Jan. 25 focuses on limitations to using MWD that will be overcome. The use of MWD products and services will be expanded to include smaller holes, higher temperature, faster and more frequent signals, more downhole memory, and additional sensors. These advances will lead to better formation evaluation, safer drilling, and increased drilling efficiency. 46 refs.

Fontenot, John E. (Completion Technology Co, Houston, TX, USA); Vikram Rao, M. *Oil Gas J* v 86 n 13 Mar 28 1988 p 52-55, 58.

## Monitoring

**072864 MWD CAN IMPROVE WELL SAFETY, CONTROL.** Measuring while drilling (MWD) can help improve well safety and at the same time reduce trouble and total drilling costs. Detection of geologically over-pressured zones with the technique is now commonplace, but virtually no advance has been made in the art of detection of influx of formation fluids into the wellbore. This third of five articles in a series describes the most recently available MWD techniques of pressure prediction and discusses the need for influx detection and possible means for realizing this in the future. 25 refs.

**072865 SUBMERSIBLE RIG/MAT UNIT DRILLS FIRST ARCTIC WELL.** Canadian Marine Drilling Ltd. (Canmar) designed and built the Single Steel Drilling Caisson (SSDC) in 1982, by converting the forward half of a 231,000-dwt tanker to a bottom-founded drilling unit. The SSDC was designed to operate from a specially constructed drillsite berm that required the movement of massive amounts of dredged materials. Although used successfully in 100-ft waters in the Canadian Beaufort, the short work season in the Arctic led Canmar engineers to determine how the system could be used more effectively. The solution focused on the use of a steel base, or mud mat, measuring 561×361×44 ft to support the SSDC. The 44-ft height was needed to provide an operational water depth of 80 ft with no bottom preparation. The large

size of the mat would also increase the footprint of the system to 192,000 sq ft from 75,000 sq ft. This increased base area, together with the incorporation of skirts, would enable the composite unit to operate in relatively weak soils without special bottom preparation. 3 refs.

**072866 SYSTEMS APPROACH SPEEDS OFFSHORE DRILLING OPERATIONS.** Five recent drilling technology innovations have been combined into a drilling system that has saved time and money for offshore operators for the past three years. This navigation drilling system combines: the latest in natural and synthetic bit technology, improved performance downhole drilling motors, a unique double-tilted navigation sub that permits both directional and straight-hole drilling, measurement while drilling, and engineered well planning for bit selection, bottomhole assembly optimization and system hydraulic design. Wells drilled with the navigation drilling system typically have been drilled 30% faster than nearby offset wells completed using conventional techniques.

**072867 SUBSURFACE IN SITU STRESS MAGNITUDES FROM OIL-Well DRILLING RECORDS: AN EXAMPLE FROM THE VENTURE AREA, OFFSHORE EASTERN CANADA.** This report describes a method of obtaining information on in situ stress magnitudes at depth in sedimentary basins by using information gathered while drilling oil wells. If we assume that one of the principal stresses is vertical at a well site, principal stress magnitudes can be estimated in the following manner.  $S_v$  is equated with overburden load, which is obtained by integrating density log records.  $S_{Hmin}$  is equated with leak-off test pressures measured over short open-hole intervals and also from selected initial feed-rate pressures. Using this approach, stress magnitudes were estimated for 44 depth intervals in four wells drilled over the Venture structure on the Scotian Shelf, offshore eastern Canada. The information obtained between subsea depths of 815 and 5783 m provides a consistent record and points to a stress regime where  $S_{Hmax} > S_v > S_{Hmin}$ . (Edited author abstract) 39 refs.

**072868 ENVIRONMENTAL EFFECT OF PRODUCED WATER FROM NORTH SEA OIL OPERATIONS.** Produced water from North Sea oil reservoirs contains substantial amounts (about  $1g\ l^{-1}$ ) of non-hydrocarbon organic matter, largely as salts of acetic, propionic and butyric acids, as well as some 20-40  $mg\ l^{-1}$  of dissolved hydrocarbons such as benzene, toluene and xylene. The non-hydrocarbon components originate in water in the oil-bearing formation. All of the organic matter can be accounted for, within analytical accuracy. The water also contains some 20-30  $mg\ l^{-1}$  of ammoniacal nitrogen and a number of inorganic components. At peak water production from production installations in the North Sea some  $1-2 \times 10^5$  tonnes  $yr^{-1}$  of organic acids will be discharged in the U.K. sector of the North Sea. The ready biodegradability of the organic constituents and the low toxicity of produced water have been confirmed by direct measurement; acute toxicity is unlikely at dilutions of greater than 100 fold. Dispersion has been modelled and tested in the laboratory indicating some 1000 fold dilution within less than 50 m of the discharge. (Edited author abstract) Refs.

**072869 ADVANCE OPEN MARGINAL OFFSHORE SECTORS.** New standards of topsides completion are being achieved on two gas field developments in the Southern basin of the North Sea. The arrival of new

and upgraded heavy duty crane barges has enabled engineers on the Conoco (UK) Ltd. V fields project and BP Petroleum Development's Villages project to design heavy, integrated decks where much of the equipment has been commissioned and tested before floatout. The decks for the two developments both weigh over 5,000 metric tons. The U.K. industry is now moving into a new phase of integrated deck construction with a 7,500 metric-ton unit for Shell/Esso's Kittiwake oil field in the central North Sea. Kittiwake is a relatively small offshore oil project and some of the larger developments now on the drawing board, notably BP's Miller field, will revert to modules and offshore hook-up. These super modules will be the size of some integrated decks. The topsides for V fields and villages have set standards that other fields will need to emulate if they are to achieve the cost savings needed to meet tight development budgets. (Author abstract)

**072870 STEERABLE SYSTEM ADDS PRECISION TO GULF DRILLING.** A well bore intersection was achieved ahead of schedule with a steerable drilling system in the Gulf of Mexico. A computer-generated proximity survey comparing the directional surveys of the initial and replacement wells, confirmed that the wells were within 1 ft of each other near the planned intersection depth of 8,890 ft. All objectives for the 9,050-ft replacement well were accomplished 4 days ahead of schedule. This operation illustrates the effectiveness of the steerable drilling system for obtaining better directional control, increased drilling efficiency, and reduced overall drilling time.

**072871 TECHNOECONOMIC MODEL FOR OFFSHORE SUPPLY OPERATIONS.** The vital role of logistic support for maintaining uninterrupted drilling operations is well known to offshore petroleum engineers. Moreover, its importance is growing as exploration and production activities are extended to progressively deeper water and harsher weather conditions. However, no systematic approach for ensuring effective logistic support has yet been realized. A method of studying the characteristics of logistic support and of designing a system for securing effective supply to an offshore rig is proposed. It is based on event simulation modeling of offshore supply operations, together with more conventional technical and economic models for yielding economic criteria which take into account a possible interruption of drilling operations. The method has been developed through a detailed investigation of each component of the supply operation and of the inherent problems. To evaluate the feasibility of the approach, an example has been provided. (Author abstract). 5 Refs.

**072873 ONBOARD SYSTEM PROVIDES STABILITY, MOORING, AND MOTION ANALYSIS FOR SEMISUBMERSIBLE DRILLING OPERATIONS.** Vessel stability, mooring, and motion-related decisions on semisubmersible drillships have historically been made with a combination of the marine crew's experience and

guidelines documented in the ship's operating manual. This is especially true once the vessel is on location and operations are under way. This situation leaves the operator dependent on contractors to anticipate problems and to take correct remedial action. This paper presents a computer system that combines state-of-the-art marine technology with a simple user interface to provide information useful to operations personnel in making decisions. The purpose of the system is not to take over any of the contractors' responsibilities. It does provide additional information useful in making marine-related decisions. This allows the contractor and the operator to combine experience and analysis and work toward a mutual decision. (Edited author abstract). 6 Refs.

**072874 OFFSHORE DRILLING AND COMPLETION/WORKOVER RIGS.** In the seventies Deutag in cooperation with Shell started to develop an idea based on the comprehensive conception of simultaneously effecting different operational steps during drilling of offshore production wells. As a result in 1977 we have developed the DUNLIN A platform a conductor driving rig of simple design and lower cost. The experience gained over the past ten years clearly shows that well service or workover rigs, respectively, should be designed to have the highest possible degree of mobility, allowing operation on a variety of platform types.

#### Optimization

**072875 NEW TECHNIQUES IN HORIZONTAL AND DRAIN-HOLE DRILLING OPTIMIZATION: PART 2 - GEORGSDORF 503, HORIZONTAL DRILLING PROJECT.** GEORGSDORF 503 is one of the two drain-hole-wells in the eastern part of the Georgsdorf Oilfield, where the 503 was originally planned to be the production, the 502 to be the injection well. Both wells, located parallel in approx. 250m of lateral distance, should cross the Bentheimer Sandstone over an entire length of 650m from top to bottom. By means of that new technique of development of hydrocarbons in combination with secondary and possibly tertiary recovery, the production of marginal oil and gas fields should become economical in the future. (Edited author abstract)

Prevedel, B. (PREUSSAG Aktiengesellschaft). *Soc Pet Eng AIME Pap SPE Unsolicited Manuscript Sep 1987 SPE* 017080, 18p.

**072876 MULTIPLE REGRESSION APPROACH TO OPTIMIZE DRILLING OPERATIONS IN THE ARABIAN GULF AREA.** This paper reports a successful application of multiple regression analysis, supported by a detailed statistical study to verify the A.T. Bourgoyne and F.S. Young model. The model estimates the optimum penetration rate (ROP), weight on bit (WOB), and rotary speed under the effect of controllable and uncontrollable factors. Field data from three wells in the Arabian Gulf were used and emphasized the validity of this model. The model coefficients are sensitive to the number of points included. The correlation coefficients and multicollinearity sensitivity of each drilling parameter on the ROP are studied. (Edited author abstract) 4 refs.

#### Planning

**072878 INTERACTIVE COMPUTER GRAPHICS SYSTEM IMPROVES PLANNING OF DIRECTIONALLY DRILLED WELLS IN THE EAST WILMINGTON FIELD.** The Long Beach Unit of the East Wilmington field contains more than 1,200 wells directionally drilled from four manmade islands and five land-based drilling sites. Planning new wells that avoid interference with existing wells becomes more difficult and time-consuming as the density of wells in the Unit increases. Improvements and modifications in design procedures have culminated in the interactive computer graphics system now in use. The interactive computer graphics system (ICGS) permits the viewing of a proposed new well or redrill well course, together with all existing well surveys and other proposed well courses in the area of interest. Plan, section, and traveling cylinder views can be displayed to allow the identification of design problems. The significance of the problems is then minimized by use of the interactive features of the system to refine the design parameters. The system's interactive features are also used to create, edit, and plot the finalized design. (Edited author abstract). 1 Ref.

#### Rigs See Also SEMISUBMERSIBLES—Stability.

**072880 DISCUSSION OF MINIMUM-COST CASING DESIGN FOR VERTICAL AND DIRECTIONAL WELLS.** Wojtanowicz and Maidla (1987) suggest cost as a criterion for casing design. This suggestion is misleading because casing cost is usually arrived at after the final selection of casing is made. Casing selection is based on a variety of factors relating to loading conditions arising from drilling and production operations. The availability of casing and logistics are exterior factors that can influence the casing selection and its cost. No company has unlimited access to all grades and types of available casing. If this were the case, then cost would become a criterion after an initial selection of casing is made on the basis of wellbore forces. 3 refs.

**072881 DRILLING RIGS DESIGNED FOR EARTHQUAKES.** The key in designing platforms for earthquake-prone areas such as offshore California is to make sure the natural response frequency of the platform

avoids the peak natural frequency of the ground during a seismic event; thus obtaining a dampening effect versus an amplification effect. A significant portion of the drilling structure's loads are live drilling loads. In fact, the drilling loads could equal 75% of the structure's dead load. The setback, hook, and rotary loads are constantly shifting during drilling, tripping, logging, running casing, and various other operations. To compensate for these significant live loads and yet not overdesign, an in-depth time study was performed using maximum loads during a given operation. An earthquake analysis was performed to determine dynamic loads in individual structural members of the drilling rig, as well as a resultant loading of the platform skid beams. Engineers used the ANSYS finite element computer program with the response spectrum method of dynamic analysis.

**072882 CASE STUDY EVALUATION OF SUBSEA PREFERENTIAL-WELD HEAT-AFFECTED-ZONE CORROSION.** This paper discusses parameters studied in an attempt to correlate the spread and severity of the corrosion problem with variances in geometry, metallurgy, and cathodic protection. Correlations were found that enabled the successful prediction of location of further corrosion grooves and allowed a new optimum inspection program based on both fatigue prediction and weld corrosion history. The presence of the corrosion grooves in many cases gives spurious crack-like indications with magnetic particle inspection (MPI). This paper also discusses how alternating current potential difference (ACPD) inspection techniques together with profile-molding techniques were used to eliminate spurious readings and to characterize the grooving shape for detailed fracture-mechanics assessment. (Edited author abstract). 4 Refs.

**072885 HOW TO COMBAT OIL-BASED MUD LOSSES.** Oil-based muds have proved successful in solving many problems associated with today's complex drilling operations, but their use often is restricted by concerns over possible lost circulation. Among the factors currently being investigated are some important differences between oil-based and water-based systems that affect whether losses will occur and how circulation can be regained. A discussion is presented of lost circulation control, fibrous sealing materials and the field use of oil dispersible wood fiber. It is shown that adequate knowledge of mud system differences, use of a new oil-dispersible wood fiber and application of specific operating guidelines can limit mud losses to reasonable quantities while still permitting fast drilling. 5 refs.

**072886 PROCESSES AND FACTORS OF ACTIVATION OF CLAY DRILLING MUDS BY PULSED ELECTRIC DISCHARGES. II.** The results of investigating the change in the breakdown voltage during treatment of clay drilling muds by pulsed discharges are given. It is suggested that to take into account this change through the probability of breakdown of the medium a mathematical model is required. A discussion is presented of the proposed mathematical model. (Edited author abstract) 6 refs.

**072887 ADDITIVE EFFECTIVENESS AND CONTAMINANT INFLUENCE ON FLUID-LOSS CONTROL IN WATER-BASED MUDS.** The proper fluid-loss control of drilling muds becomes more difficult when drilling high-temperature, high-pressure formations. Chemical additives for reducing fluid loss differ considerably in effectiveness; in turn, these differences vary, often unpredictably, with temperature and pressure. This paper discloses the results of static-filtration experiments that compare capabilities of various additives to minimize filtrate invasion at elevated temperatures when the mud contains certain common contaminants. The effects of mud weight, high-temperature aging, and the presence of asphalt on mud fluid loss were also investigated. The additives selected for study were WL-100, carboxymethyl cellulose (CMC), Dextrid, CC-16, Resinex, and several asphalts. (Edited author abstract). 21 Refs.

## Stresses

**072889 STABILITY OF HIGHLY INCLINED BOREHOLES.** Hole inclination produces alternations in the stress state around the borehole and in the physical properties of the rock. Depending on specific conditions, such effects may lead to collapse of the borehole or a reduction in the fracture-initiation pressure. This paper shows how to determine such effects through the application of stress analysis and rock mechanics. (Author abstract) 17 refs.

## Texas

**072890 MODEL CASE HISTORY OF INFELD DRILLING AND COMPLETION IN SOUTH TEXAS.** This group project presented an opportunity to improve overall operations from title clearance to on-stream producing. Changes and improvements in virtually every area of drilling and completion contributed to substantial savings in time and money. These savings resulted in the drilling of twice as many wells as originally proposed, and all improvements are supported by actual field tests. This paper deals primarily with drilling and completion operations in Laredo, TX, area. (Author abstract) 1 ref.

## Thermal Effects

**072891 FORMATION TEMPERATURE ESTIMATION BY INVERSION OF BOREHOLE MEASUREMENTS.** The authors describe a new numerical method that uses inverse methods to model thermal stabilization of a borehole after drilling mud circulation has stopped. The following five geophysical parameters can be estimated from the method: (1) true formation temperature ( $T_f$ ); (2) mud temperature ( $T_m$ ) at the time the mud circulation stops; (3) thermal invasion distance ( $R$ ) into the formation before the formation is at the true formation temperature ( $T_f$ ); (4) formation thermal conductivity ( $K$ ) perpendicular to the borehole; and (5) efficiency factor ( $F$ ) for heating mud in the borehole after mud circulation has stopped. Applications of the new inverse procedure to both synthetic data and field data show that the true formation temperature in many cases can be estimated precisely (to within about 0.4 percent); that the mud temperature can be estimated with acceptable accuracy (5 percent or so); while the thermal conductivity ( $K$ ), the thermal invasion distance ( $R$ ), and the efficiency factor ( $F$ ) can be roughly estimated, provided high-quality data are available. (Edited author abstract).

## Turbodrills

**072892 MONITORING BOTTOM-HOLE PARAMETERS DURING TURBINE DRILLING.** The results of experiments convincingly confirm the possibility of obtaining bottom-hole information by measuring the pressure of the drilling fluid in the injection line. This information may be used not only to monitor the operation of the turbodrill but also to study the characteristics of the rocks being drilled and the condition of the well shaft and the drill bit. In Russian. 3 refs.

## Vibrations

**072893 STUDY OF EXCITATION MECHANISMS AND RESONANCES INDUCING BOTTOM-HOLE-ASSEMBLY VIBRATIONS.** This paper presents a study of important excitation mechanisms and resonances that cause bottomhole assembly (BHA) vibrations during drilling operations. The study is based on dynamic vibration data gathered in a test well with our Advanced Drillingstring Analysis and Measurement System (ADAMS) surface measurement system. The data were gathered while three different BHA's were used to drill portions of this well to 800 ft [244 m]. A case study for a large-diameter hole in an actual field well is also presented. The data showed many velocity-dependent excitation mechanisms, including  $1 \times \omega$ ,  $2 \times \omega$ ,  $3 \times \omega$ , a drillstring walk mechanism, and drillstring whipping mechanisms that were dependent on the drillstring and

hole geometries. The data also show important resonances that may be excited, including resonances with strong local contributions, and axial and torsional resonances. When the excitation mechanisms match these resonances, damaging vibrations can be induced. (Edited author abstract) 15 refs.

## Waste Disposal

**072894 THERMAL MODELING FOR FREEZE-BACK DISPOSAL OF DRILLING WASTES ON ALASKA'S NORTH SLOPE.** Regulations pertaining to solid waste disposal have recently undergone major revision by the Alaska Department of Environmental Conservation (ADEC) and now include special provisions especially relevant to the disposal of drilling wastes. Among the various options now available to a permittee, the new regulations allow that freezeback containment is an acceptable and perhaps preferable means of disposal in certain permafrost soils. Maximum thaw depth prediction in order to ensure that wastes are buried sufficiently deep to remain frozen is felt to be important. The purpose of this paper is to examine thermal analysis methods which are currently being used, or which might be used to predict thaw depths associated with such disposal sites. The author is particularly concerned with the reason for the widely ranging values of thaw depth arrived at using the modified Berggren equation for what would otherwise appear to be similar soils in similar circumstances. 24 Refs.

**072895 DECONVOLUTION OF WELL LOG DATA - AN INNOVATIONS APPROACH.** Modern filtering theory as typified by the Kalman filter has provided a general technique for the design of algorithms that process data to provide optimum estimates of quantities associated with data sets. Additionally, these algorithms make possible the recursive processing of measured data in a computationally efficient manner. Kalman filtering can be and has been applied to inverse filter or deconvolve well log data, but such attempts have met with limited success due to the practical difficulties of accurately modeling the tool output measurement data as the filtered output of a white-noise driven linear system. This paper describes an approach that retains the computational efficiency of the Kalman filter while at the same time avoiding the necessity of modeling the measured data as the filtered output of a white-noise driven linear system. An algorithm is presented which depends only on the measured data, the tool response function, and a procedure for extracting the innovations from the data. Data are processed sequentially, and the data innovations (defined as the new information contained in a measurement that was not in the previously processed data points) are recursively extracted from each data point. Examples using real data from induction, sonic and gamma-ray logs illustrate that practical and reliable deconvolution algorithms are provided using the innovations approach. (Author abstract) 9 refs.

**072896 SCALE MODELLING OF THE LATEROLOG USING SYNTHETIC FOCUSING METHODS.** The Laterolog tool is a focused electrode tool used in well logging for the measurement of formation resistivity. The model tool makes use of one of two alternative methods of focusing the current into the formation. One method,

manual focusing, is a manual analog to the focusing method used in the actual tool. The other method, synthetic focusing, uses the principle of superposition to analytically simulate a focusing situation. This method requires the measurement of electrode potentials for separately applied currents. Both methods are used to log a synthetic formation composed of porous concrete suspended in saline water. The logs obtained are equivalent. The synthetic method is simple to apply and avoids the potentially unstable feedback amplifier used in full scale tools. 10 refs.

**072897 WELL LOGGING TECHNOLOGY FOR HIGHLY DEVIATED AND HORIZONTAL WELLBORES.** With the Dresser Atlas pipe-conveyed logging system for highly deviated wells, i.e., the Slant-hole Express, the logging instruments are guided to the bottom of the borehole through the protection of the drillpipe. The significant difference in the Slant-hole Express operation and conventional through-drillpipe pump-down operations is in the use of a sidetrack wireline entry-sub properly placed within the drillstring. A significant advantage of the Slant-hole Express system is that no special 'wet' electrical cable connector is required for mating to the logging instrumentation. The basic concepts, considerations, observations, and field experiences with this technology are discussed and illustrated. (Edited author abstract) 4 refs.

**072898 PERENNIAL CBL CENTERING PROBLEM CAN BE MINIMIZED.** The cement bond log (CBL) has been plagued by the problem of poor tool centering since it was introduced to the oil industry. Three case histories are cited to illustrate the problem. General instructions and requirements are given that can produce good-quality CBL logs when used by both the operator representative and logging engineer. The general instructions and requirements can provide guidance during job planning to insure that communication is established and the service company knows what will be required of it on the CBL run. In addition, a check list on location can provide the company representative with some memory joggers that remind him or her of critical factors relating to CBL quality. A general check list is presented. 4 refs.

**072899 MULTIPLE DYNAMIC MATCHING: A NEW APPROACH TO WELL LOG CORRELATION.** A new method of nonlinear correlation or matching is presented which overcomes some of the difficulties of other techniques. 'Multiple dynamic matching' is based on a constrained optimization approach but contains some important innovations. Rather than finding only one solution, the present method generates a 'function network' of probable interpretations. These are then ranked by an objective function which quantifies an interpreter's qualitative matching criteria through a similarity and simplicity measure. The top ranking matching function thus determined is used to correlate the zones which are structurally equivalent in sonic well logs, and an example of an automatic structural interpretation is given. (Author abstract) 14 refs.

**072900 RESERVOIR APPLICATIONS OF DIPMETER LOGS.** Reservoir quality indicators can be delivered from the analysis of high-resolution dipmeter records. Changes in the aspect of the dipmeter curves respond primarily to changes in rock texture and sedimentary structure; their analysis can be instrumental in describing the petrophysical and reservoir properties of the forma-

tions. A four-step methodology has been set up: (1) extract dipmeter curve attributes, (2) combine dipmeter-derived data with other logs, (3) compare with core data over key intervals and (4) extrapolate to other intervals and other wells. This approach is illustrated here by three examples. (Author abstract) 6 refs.

Delhomme, Jean-Pierre (Etudes et Productions Schlumberger); Pilenko, Thierry; Cheruvier, Etienne; Cull, Richard. *JPT J Pet Technol* v 40 n 2 Feb 1988 p 180-186.

**072901 DIPMETER HELPS IN SITING SUCCESSFUL WILCOX OFFSETS.** Dipmeter logs can be used to more accurately map subsurface stratigraphic traps. After drilling into a seismically defined target in far south-western Mississippi, R.E. Williams Oil and Gas Co. geologists and their logging advisors were able to site and drill six successful offset locations to a 1984 discovery in a Wilcox point bar sandstone by applying a stratigraphic dipmeter tool. Interpretation steps leading up to the drilling of each of these wells are reviewed. 4 refs.

Anon. *World Oil* v 206 n 3 Mar 1988 p 29-32.

**072902 OBTAINING STRUCTURAL AND STRATIGRAPHIC DIP INFORMATION USING SEGMENTATION TREES AND OPTIMIZATION.** A new method of dipmeter computation is described that is based on formalizing and implementing some of the rules of optical dipmeter correlation. The new techniques used for this are segmentation trees and hierarchical, multilevel optimization. Use of this method results in precise definition of dip information on both structural and stratigraphic levels. (Author abstract) 9 refs.

**072903 GEOMETRICAL EFFECTS IN THE DIELECTRIC RESPONSE OF PARTIALLY SATURATED SANDSTONES.** Laboratory measurements have been made of the dielectric constant ( $k'$ ) of a tight gas sandstone as a function of water saturation ( $S_w$ ) in the frequency range of 10 kHz to 1 MHz.  $S_w$  was varied through adsorption of water vapor, imbibition, and drying. It was found that  $k'$  of a partially saturated sandstone depends on the geometrical distribution of water and gas in the pore space. The interpretation of the observed change in  $k'$  with  $S_w$  is based on the modified Maxwell-Wagner model in which platy insulating grains surrounded by conducting pore fluid act as capacitors, contributing to the total measured  $k'$ . It has been shown that in the interpretation of in situ measurements of  $k'$  a geometrical parameter is needed to account for the geometry of the grains. Results suggest that the distribution and resulting geometries of the liquid and gas in the pore space must also be accounted for. Alternatively, measurement of  $k'$  could be used to obtain information about the microgeometry of a sandstone and the contained fluid phases. (Edited author abstract) 26 refs.

Knight, Rosemary J. (Stanford Univ, Stanford, CA, USA); Nur, Amos. *Log Anal* v 28 n 6 Nov-Dec 1987 p 513-519.

**072904 TOTAL ORGANIC CARBON LOG FOR SOURCE ROCK EVALUATION.** The method for deriving total organic carbon uses log measurements of carbon: oxygen ratio and density porosity. The model partitions the formation into a solid and a pore space on the basis of density porosity and then treats the solid as minerals and the pore space as water. The environmentally-corrected carbon: oxygen ratio is multiplied by an approximation of the formation oxygen to obtain formation carbon. In formations containing carbonate minerals the inorganic carbon content is estimated and subtracted from the total carbon to provide total organic carbon. This approach is different from the current practice of using some combination of gamma ray, sonic, resistivity, neutron, and density logs to either identify or quantify organic matter in potential source beds. Its advantages are 1) it is sensitive to low amounts of organic carbon, 2) it does not require calibration with core data on either a single well or regional basis, and 3) it does not require extensive log

interpretation to produce an answer. (Edited author abstract) 16 refs.

**072912 BOREHOLE SEISMIC PROFILES IN THE EKOFISK FIELD.** In October 1983 a major borehole seismic survey was carried out in the Ekofisk oil field in the Norwegian sector of the North Sea on behalf of the Phillips Petroleum Licence 018 group of companies. The processing of the data through to a series of conventional common-midpoint sections has permitted detailed interpretations of the top of the Ekofisk formation and the top of the Tor formation apart from well control. Both formations are producers separated by a tight zone. The Tor formation is the primary horizon to waterflood. Information as to its lateral continuity is important in the location of proposed waterflood injector wells. Prior to the survey, the field was considered effectively unfaulted. An apparent graben lying subparallel to the borehole was detected by the surveys. Reflections from below the reservoir formations are evident. A byproduct of the survey is strong evidence for the existence of lateral velocity gradients or apparent transverse velocity isotropy associated with the overlying gas-charged sediments. (Edited author abstract)

#### 072913 NEW APPLICATIONS IN THE INVERSION OF ACOUSTIC FULL WAVEFORM LOGS - RELATING MODE EXCITATION TO LITHOLOGY.

Existing techniques for the quantitative interpretation of waveform data have been based on one of two fundamental approaches: (1) simultaneous identification of compressional and shear velocities; and (2) least-squares minimization of the difference between experimental waveforms and synthetic seismograms. Techniques based on the first approach do not always work, and those based on the second seem too numerically cumbersome for routine application during data processing. An alternative approach is tested here, in which synthetic waveforms are used to predict relative mode excitation in the composite waveform. Synthetic waveforms are generated for a series of lithologies ranging from hard, crystalline rocks ( $V_p=6.0$  km/sec. and Poisson's ratio=0.20) to soft, argillaceous sediments ( $V_p=1.8$  km/sec. and Poisson's ratio=0.40). The series of waveforms illustrates a continuous change within this range of rock properties. Mode energy within characteristic velocity windows is computed for each of the modes in the set of synthetic waveforms. The results indicate that there is a consistent variation in mode excitation in lithology space that can be used to construct a unique relationship between relative mode excitation and lithology. (Author abstract) 21 refs.

#### 072914 VELOCITY SURVEYS IN DEVIATED WELLS.

Both theory and experience indicate that vertical travel times estimated from slant times that are measured by shooting from the platform to a downhole geophone in a deviated well can be too short, potentially by more than 100 msec. A field experiment confirms this. More importantly, the data show that the error cannot easily be predicted. This uncertainty is too large for most production mapping, and so deviated well velocity surveys shot from the platform are generally not useful. 4 refs.

Goins, Neal R. (Mobil Research & Development Corp, Princeton, NJ, USA). *Oil Gas J* v 85 n 41 Oct 12 1987 p 53-56.

#### 072915 CIRCUMFERENTIAL ACOUSTIC LOG FINDS VERTICAL FRACTURES.

The basic concepts of circumferential acoustic logging are presented and an example demonstrates system application. The authors show that the circumferential acoustic log: detects presence and orientation of vertical and near-vertical fractures, microfractures, and/or stress plane zones, in uncased wellbores, provides excellent thin-bed resolution in highly stratified, laminated reservoir rocks, assisting accurate net pay determination and optimum selection of perforations, assists in multi-well field studies of natural drainage patterns and fracture trends across a reservoir, facilitates optimum selection of offset locations along major fracture trends, assists in whole core orientation via tie-in to oriented log-derived features. 2 refs.

#### 072917 CROSSWELL LOGGING FOR ACOUSTIC IMPEDANCE.

Crosswell seismic data are recorded by

placing the seismic source in one well and receivers in a second well to measure physical properties between the two wells. When reflected seismic energy is extracted from the recorded seismograms, the resultant picture is a function of acoustic impedance (density times velocity) between the wells. Previous crosswell seismic studies have predominantly used direct waves and measure only seismic velocities by tomographic techniques. Synthetic crosswell seismic data are generated by a computer to illustrate the concepts and procedures used for crosswell impedance logging in this study. Such synthetics are useful for investigating how the experiment should work, but real data reveal how the experiment does work. (Edited author abstract) 17 refs.

#### 072918 BOREHOLE TELEVIEWER IMPROVES COMPLETION RESULTS IN A PERMIAN BASIN SAN ANDRES RESERVOIR.

The borehole televiewer (BHTV) is an acoustic logging tool that has a fine vertical resolution (1/3 in. [8.5 mm]) that is extremely useful for detecting bedding orientation, thin high-permeability zones, lithology changes, and zones of secondary or vuggy porosity. BHTV logs were acquired from 10 wells during the recent infill drilling of the North Hobbs (Grayburg/-San Andres) Unit. These logs, when correlated with conventional logs and core data, have improved completion strategies, resulting in higher oil and lower water production in new infill wells. (Author abstract) 7 refs.

#### 072919 LOW-FREQUENCY TUBE WAVES IN PERMEABLE ROCKS.

Low-frequency tube waves in permeable boreholes are of interest because their propagation depends upon in-situ rock permeability. In this paper, the authors use low-frequency asymptotics to unify two approaches that both describe tube waves. The first approach is due to White, in which the low-frequency tube-wave velocity and attenuation are expressed explicitly as functions of frequency. The expressions include contributions from three factors: the borehole fluid compressibility, the wall rigidity, and the wall impedance due to the permeability of the solid. The second approach is the full solution of tube-wave properties based on Biot theory and the appropriate boundary conditions between the fluid and the porous solid. By taking the low-frequency approximations to the full solution, the authors derive an explicit expression for the tube-wave properties, similar to White's expression. White's formulation is hereby corrected to include the elasticity of the solid frame around the borehole. (Edited author abstract)

Chang, S.K. (Schlumberger-Doll Research, Ridgefield, CT, USA); Liu, H.L.; Johnson, D.L. *Geophysics* v 53 n 4 Apr 1988 p 519-527.

#### 072920 FULL-WAVE SYNTHETIC ACOUSTIC LOGS IN RADIIALLY SEMIINFINITE SATURATED POROUS MEDIA.

The wave field generated by a point source in an axisymmetric fluid-filled borehole embedded in a saturated porous formation is studied in both the spectral domain and time domain. The formation is modeled following Biot theory modified in accordance with homogenization theory. When the borehole wall is permeable, guided waves can be significantly affected by the permeability of the formation. Whatever the formation, fast or slow, Stoneley-wave phase velocity and energy decrease and attenuation (in the sense of  $Q^{-1}$ ) increases with increasing permeability. These effects are more important in the very low-frequency range, where Darcy's law governs the fluid motion and the wave energy at the interface is maximum, than at higher frequencies. The effects increase and persist over a larger frequency range with decreasing viscosity and increasing compressibility of the saturant fluid, with increasing pore-fluid volume, and with decreasing borehole radius. In contrast, the effects

decrease with decreasing stiffness of the formation because of more efficient coupling of the interface wave to the surrounding medium. (Edited author abstract)

**072921 CIRCUMFERENTIAL ACOUSTIC LOGGING.** A circumferential acoustic logging instrument that operates at a radial mode resonance of 120 kHz utilizes opposing pairs of acoustic transmitters and receivers mounted on pad assemblies, which are pressed against the borehole wall. An important feature of the instrument is a baffle system which effectively minimizes the propagation and reception of the direct fluid wave. The incorporation of the baffle allows both types of boundary waves, the Rayleigh and the guided fluid wave, to be more easily recognized. At present, the primary application of the circumferential acoustic log is in locating natural fracture systems. When run with an orientation section, the instrument is also capable of determining fracture direction. Several field examples are presented here which demonstrate the capabilities and effectiveness of circumferential acoustic logs. (Author abstract) 3 refs.

McDougall, J. (Dresser Industries Inc, Houston, TX, USA); Fertl, W.H.; Chilingarian, G.V.; Yen, T.F. *Energy Sources* v 10 n 1 1988 p 43-53.

**072922 MULTIPLE P-WAVE LOGGING IN FORMATIONS ALTERED BY DRILLING.** Wave trains produced by conventional and multipole sonic logging tools may be expected to depend upon whether the formation has been altered by the drilling process. Such alteration may include invasion by drilling fluids and/or drilling damage. It is shown, by theoretical modeling, that a dipole or quadrupole tool operating at conventional logging frequencies (in the range 10-20 kHz) detects P waves from the virgin formation with a much higher signal-to-noise ratio than does a monopole tool. This permits the multipole tool to measure formation P-wave velocities two to three times farther away from the borehole than a conventional monopole tool. This large radius of investigation typically extends beyond the altered zone for most situations, even for sources and receivers spaced several meters apart. However, this conclusion is valid only if the velocity of the altered zone is less than the velocity of the virgin formation. (Edited author abstract). 22 refs.

**072923 PHYSICAL MODELING OF THE FULL ACOUSTIC WAVEFORM IN A FRACTURED, FLUID-FILLED BOREHOLE.** Three concrete models were constructed, one each with a fracture oriented at 90, 45, and 10 degrees to the axis of the borehole. These were used to simulate physically the propagation of the full acoustic waveform through a fluid-filled borehole in crystalline rock and to ascertain the effects of fracture aperture and orientation of fluid-filled fractures on the waveform. The tube-wave mode of the waveform is most indicative of the magnitude of fracture aperture. Normalized tube-wave amplitude decreased as a negative exponential function of aperture over the range of fracture apertures studied (closed to 0.66 cm). The 90 degree fracture orientation caused greater tube-wave amplitude reduction than the 45 degree fracture. It is suggested that this reduction can be attributed to the borehole walls guiding the wave across the 45 degree fracture. However, the 10 degree model gave ambiguous results, which are believed to be related to the low ratio of tube-wave wavelength to aperture as measured parallel to the borehole axis, i.e., axial aperture. (Edited author abstract). 8 refs.

**072924 ROBUST AND LEAST-SQUARES ESTI-**

**MATION OF ACOUSTIC ATTENUATION FROM WELL-LOG DATA.** Several least-squares attenuation (Q) estimation algorithms are tested on various types of models. These algorithms include the spectral ratio method and methods based upon eigenvector decomposition and Wiener filtering, all of which are unsatisfactory. Hence more robust methods are needed. The errors in Q estimation have an asymptotically Cauchy distribution, with a reasonable noise model and Gaussian input noise. On noise models with Gaussian errors slightly contaminated by Cauchy or Laplacian noise, a maximum-likelihood (ML) estimator based on Gaussian noise performed best. On heavily contaminated models, the ML estimator based on Laplacian noise performed best; but simple, robust estimators such as the median also did well. On more realistic models with noise, the median and alpha-trimmed mean appear to be the best. (Edited author abstract). 15 refs.

**072925 IMPROVED INTERFACE DETECTION FOR VERTICAL SEISMIC PROFILE INVERSION.** For VSP inversion prior knowledge of the wavelet obtained from the downgoing wave field is used to locate and constrain the number of interfaces used in the forward model. Grivelet (1985) presented an algorithm to do this constraining based on the extremum in the crosscorrelation of the estimated wavelet and trace. In this paper, an improved detection algorithm is presented which looks at three extrema in the crosscorrelation and then looks one step ahead seeking to minimize trace energy. The procedure can be generalized to looking at more extrema and increasing the depth of the decision-tree search. 3 refs.

**072926 EVALUATION OF FORMATION PROPERTIES FROM PROCESSING AND INTERPRETATION OF THE EVA TOOL LOGS.** A new tool, EVA (Evaluation of Velocity and Attenuation), is a 4-transmitter/12-receiver long spacing tool permitting recording of the complete waveform and processing of all information contained in the acoustic signal. The key point for optimum results is a robust and automatic processing which allows quantitative estimation of different parameters such as velocity, amplitude, and period of all the three main types of waves, i.e. compressional (P), shear (S), and Stoneley (ST) waves. In parallel with the processing phase, the analysis of the raw data leads to a qualitative and very rapid interpretation of the recordings. Once the processing is completed and all parameters obtained, these may be applied to a quantitative interpretation of the EVA data. (Edited author abstract) 4 refs.

## Computer Aided Analysis

**072928 LOG ANALYSIS METHODS AND EMPIRICAL DERIVATION OF NET PAY PARAMETERS**

**FOR CARBONATE RESERVOIRS IN THE EASTERN MONTANA PART OF THE WILLISTON BASIN.** The purpose of this petrophysical study is the refinement of previously developed log analysis methods and the determination of empirically derived net pay parameters which can be used by the log analyst in exploration, property enhancement, and acquisition studies. Twenty-one wells were selected in the study area for evaluation based on the availability of 'modern' log suites, multiplicity of tests, and geographic distribution. Significant untested pay potential is indicated in many of the wells evaluated. Most of the untested pay potential is in the Ratcliffe, Mission Canyon, Nisku, Duperow, Winnipegosis, and Interlake formations. The application of these log analysis methods and net pay parameters should improve success rates for those projects in which log analysis is critical. (Edited author abstract) 7 refs.

## Computer Simulation

**072929 NEW HIGH-SPEED HYBRID TECHNIQUE FOR SIMULATION AND INVERSION OF RESISTIVITY LOGS.** The inversion of resistivity logs with multiple bed boundaries is of vital interest to log analysts, but previously published methods have been optimized for cases of many radial boundaries with a serious loss of speed when many bed boundaries are considered. This paper describes a hybrid solution (analytic radially and numeric vertically) that can simulate a 100-ft [30.4-m] log with 25 beds in less than 12 minutes on an IBM 3081. The model assumes axial symmetry with no dip and with the tool centered in the borehole. Decomposition of the measured potential into the product of two independent functions describing its radial and axial dependence allows us to choose the best method for evaluating each function. (Edited author abstract) 7 refs.

**072930 FORMATION IMAGING WITH MICRO-ELECTRICAL SCANNING ARRAYS.** A new Formation MicroScanner Tool (FMS) has been developed for obtaining two-dimensional, high-resolution imagery of microresistivity variations around the borehole wall. The measurement concept is an extension of our dipmeter technology; the imaging capability arises through the use of an array of electrodes distributed azimuthally on a conducting pad. The imaging resolution is on the order of a few millimeters in both vertical and azimuthal directions, thereby allowing core-like characterizations for applications such as stratigraphic analysis, facies identification, fracture and fault description, recognition of zones of secondary porosity, and improved petrophysical modeling of clay distribution (laminated versus dispersed shales). World-wide testing of the tool has confirmed that the measurement is robust, repeatable, and of high quality. Comparison of its electrical imagery with physical cores has been striking. (Edited author abstract) 8 refs.

**072931 COMPLEX DIELECTRIC INTERPRETATION OF 20-MHz ELECTROMAGNETIC LOGS.** An interpretation technique for the  $20 \times 10^6$ -cycle/sec [20-MHz] dielectric log based on the complex Lichteneker-Rother (LR) equation is proposed. The equation is shown to be an adequate model of quarry rocks and is applied to field logs from the California coastal basins. The results are significantly better than those obtained

with other techniques. The major disadvantage is that core data are required for calibration in each reservoir. (Author abstract) 8 refs.

## Electromagnetic

**072932 ANALYTIC MODEL FOR ELECTROMAGNETIC WIRELINE TOOLS.** A mathematical model for electromagnetic tools is presented that accounts for the finite size of the transmitter and receiver coils, tool mandrel, a shielding conductor internal to the tool, and the concentrically stratified media surrounding the tool. The model is applied to various tools in the  $20 \times 10^3$  to  $1 \times 10^9$  cycle/sec [20-kHz to 1-GHz] frequency range, and results indicate that this model will be useful in designing future tools. (Author abstract) 8 refs.

Durgapal, Prabha (Welex). *SPE Form Eval* v 3 n 1 Mar 1988 SPE 14190, p 17-23.

**072933 MODELING OF THE DIELECTRIC LOGGING TOOL AT HIGH FREQUENCIES: THEORY.** The high-frequency dielectric logging tool is analyzed, using first-principle electromagnetic field analysis, to determine characteristics such as tool behavior during measurement in a well logging environment. The theoretical model, a composite boundary value problem, consists of a source backed by an infinite ground plane (the measurement tool) in front of a two-dimensional inhomogeneity (geologic formation) which is divided into regions. The solution in each region is treated analytically in two dimensions, and numerically in one dimension. The one-dimensional problem is solved using the finite-element method, resulting in a conventional eigenvalue problem. This allows the eigenmodes of each region to be found systematically. Once the eigenmodes are found in each region, the solution for the two-dimensional inhomogeneity is obtained by matching boundary conditions at a discontinuity as in the method of mode matching. This gives the reflection and transmission operators characterizing each discontinuity. When the reflection and transmission operators for a single discontinuity are known, the case of more than one discontinuity can be derived. 10 refs.

Chew, Weng Cho (Univ of Illinois at Urbana-Champaign, Urbana, IL, USA). *IEEE Trans Geosci Remote Sens* v 26 n 4 Jul 1988 p 382-387.

**072934 MODELING OF THE DIELECTRIC LOGGING TOOL AT HIGH FREQUENCIES: APPLICATIONS AND RESULTS.** The high-frequency dielectric logging tool is useful in electromagnetic well logging, because, by measuring the dielectric constants of rock formations at high frequencies (1 GHz), the water saturation of rocks can be inferred without knowing the water salinity in the rocks. The results of a theoretical model presented in a previous paper by the author are reported. Use is made of the theoretical model to study the behavior of such a tool across geological sedimentary beds. The effect of using different polarizations on the measurement is considered, along with the standoff and mudcake effects that reflect on the depth of investigation of such a tool. The use of borehole compensation modes in the measurements is also considered. It has been found that the TE polarization is more robust than the TM polarization in terms of mudcake and standoff effects. Also, the standoff effect affects the measurement more severely than the mudcake effect. Shorter receiver spacings give rise to higher resolution in the measurement. Borehole compensation results in a slight loss of resolution, and horns in the logs are removed. 15 refs.

Chew, Weng Cho (Univ of Illinois at Urbana-Champaign, IL, USA). *IEEE Trans Geosci Remote Sens* v 26 n 4 Jul 1988 p 388-398.

## Equipment

**072935 SATELLITE TECHNOLOGY APPLIED AT THE WELL SITE.** The overall system consists of two subnetworks. A well site-to-hub subnetwork consists of

the link from the well site to a large receiving station, the hub, near Denver, Colo. At the well site, a small 4-ft (1.2-m) Ku band transmitter antenna transmits a fairly weak signal via the satellite to the large 30-ft (9-m) receiving antenna at the hub. Once at the hub, the data then is automatically transcribed into a format (either a graphics playback or digital data) and is transmitted via telephone lines to the operator's receiving terminal. The well site unit consists of a 4-ft (1.2-m) transmit-receive antenna and an electronics module which fits in the logging truck. The well site antenna is transportable, consisting of five pieces and can be easily assembled or disassembled in 10 to 15 minutes. Once assembled, the antenna elevation and azimuth are calculated by the software in the logging truck for properly aiming the antenna to acquire synchronization with the satellite. The well site unit can transmit data at various speeds with a maximum of 496 Kbs, providing fast transfer of data from the well site to the hub or to the data center.

**072936 COILED-TUBING LOGGING SYSTEM.** Techniques have been developed to use coiled tubing containing a seven-conductor wireline to facilitate logging operations. Equipment has been designed to permit the connection of conventional logging tools to the tubing and the recording of logs. Operating techniques have been developed and applied under various wellbore conditions. The system allows traditional log measurements in a well while wellbore conditions are controlled. The ability of coiled tubing to push tools down highly deviated or horizontal wellbores makes logging or perforating feasible in these wells. Expenses can often be reduced with coiled-tubing logging because a rig is unnecessary during many operations. (Edited author abstract) 4 refs.

**072937 TEST OF A HIGH-RESOLUTION SPECTROSCOPY LOGGING TOOL TO MEASURE CHLORINE IN A LOW-SALINITY RESERVOIR.** A series of tests was conducted to evaluate the usefulness of neutron-induced gamma spectra recorded by a detector cooled to the temperature of liquid nitrogen. These tests were conducted in an oil well that had been evaluated with core and other logging techniques. Results showed that measurements of carbon abundance were not accurate enough to enable useful estimates of oil abundance, but measurements of chlorine abundance could be used to estimate brine saturation if data were accumulated long enough. The commercial logging equipment tested consisted of two different tools that combined a high-resolution detector with both chemical and 14-MeV pulsed neutron sources. Methods were developed to process and display the 4,000-channel spectra recorded. (Edited author abstract) 17 refs.

Neuman, C.H. (Chevron Oil Field Research Co). *SPE Form Eval* v 3 n 1 Mar 1988 SPE 15438, p 40-46.

**072938 BOREHOLE CORRECTION MODEL FOR CAPTURE GAMMA RAY SPECTROSCOPY LOGGING TOOLS.** A borehole correction model, based on more than 1,000 laboratory measurements, has been developed for logging tools that measure gamma ray energy spectra induced by the capture of thermal-energy neutrons. The measurements were made with a field-worthy tool incorporating a pulsed source of 14-MeV neutrons and a NaI(Tl) gamma ray detector. In addition to the obvious geometric dependencies on borehole and casing sizes, the sensitivity of the measurement to elements within the borehole was found to depend just as strongly on the porosity and salinity of the borehole and formation fluids. The model decouples the geometric effects from most of the nuclear physics effects by explicitly including the time decay of the neutron flux in each homogeneous region. (Author abstract) 8 refs.

## Induction

**072939 CHARTS FOR CORRECTING EFFECTS OF FORMATION DIP AND HOLE DEVIATION ON INDUCTION LOGS.** Computer-simulated deep induction logs show that the apparent resistivity at the center of a dipping bed is affected by the dip of the bed. Generally the apparent resistivity decreases with dip angle. It is not unusual to find that the apparent resistivity decreases by a factor of two or more when the dip angle is varied from 0 to 60 degrees for thin beds. To obtain the true resistivity a correction is needed. Such quantitative correction is available in the form of correction charts. Charts for dip angles of 5, 30, 45, and 60 degrees for shoulder bed resistivities of 1 and 10 ohm-m are presented. (Edited author abstract) 6 refs.

Hardman, R.H. (Univ of Houston, Houston, TX, USA); Shen, L.C. *Log Anal* v 28 n 4 Jul-Aug 1987 p 349-356.

**072940 EFFECT OF DIPPING BEDS ON THE RESPONSE OF INDUCTION TOOLS.** This paper describes a computer model for studying the effect of dipping beds on the response of induction tools. Simulated tool response in an arbitrary number of dipping beds is obtained from calculations of the magnetic fields of an equivalent magnetic dipole with an axis arbitrarily oriented with respect to the direction of stratification. The effects of the borehole and the invaded zone are neglected to solve the problem in a closed form. In addition to describing the model, we also study the effect of dip angle on the apparent resistivity and the apparent bed thickness as read by induction tools in several typical logging configurations. (Author abstract) 9 refs.

Instruments See Also BOREHOLES—Logging.

**072941 INTERPRETING AN RFT-MEASURED PULSE TEST WITH A THREE-DIMENSIONAL SIMULATOR.** An interpretation procedure has been developed to analyze repeat formation tester (RFT) pressure surveys quantitatively during well-to-well interference tests with a three-dimensional (3D) simulator in which only the pressure equation is solved, while retaining saturation effects on fluid viscosity and relative permeability. This approach accurately and efficiently determines location and transmissibility of faults, horizontal permeability of production zones, and vertical permeability of barriers over length scales comparable to reservoir dimensions. (Author abstract) 7 refs.

Neutron See Also BOREHOLES—Logging; GEOPHYSICS—Radioactive Methods; OIL FIELDS—Formations; POROSIMETERS; SCINTILLATION COUNTERS—High Temperature Effects.

**072942 NEW DIGITAL MULTISCALE PULSED NEUTRON LOGGING SYSTEM.** A new multiscale pulsed neutron capture logging system (PDK-100) is discussed. The instrument is a 1 11/16-in. [1.7-cm]-diameter, microprocessor-controlled logging sonde that processes raw data occurring in the short- and long-spaced detectors. The timing spectrum (10  $\mu$ sec per channel and 100 channels for the decay component) of the detector events is accumulated downhole and transmitted to the surface computer logging system upon command by a pulse code modulation data transmission system. This configuration makes use of significantly increased count rates to improve log repeatability greatly. Unique data reduction techniques are also possible with the high-reso-

lution data. The gamma rays during the burst of 14-MeV neutrons are also processed. This unique feature allows derivation of the ratio of inelastic to capture count rates, which is a function of porosity. (Edited author abstract) 8 refs.

Randall, R.R. (Dresser Industries Inc); Gray, T.P.; Craik, G.C.; Hopkinson, E.C. *SPE Form Eval* v 2 n 4 Dec 1987 SPE 14461, p 395-400.

**072943 RESERVOIR MONITORING WITH THE THERMAL MULTIGATE DECAY LOG.** The thermal multigate decay (TMD) logging system, which uses a two-exponential model to isolate borehole and formation  $\Sigma$  effects, can be an effective device for the high-accuracy environment of monitor logging. The minimized influence of borehole parameters on the formation sigma ( $\Sigma^{CORR}_{FM}$ ) results in residual oil saturation (ROS) calculations that compare favorably with expected values. The measurement of borehole parameters enables the user to determine whether proper formation flushing has been achieved and whether borehole fluid contamination of perforated intervals presents a potential interpretation problem. Test pit data and field results indicate that the use of flushing salinities less than approximately 70,000 ppm NaCl can result in significant borehole effects to the observed formation decay rates. (Edited author abstract) 13 refs.

Wyatt, D.F. Jr. (Welex); Smith, H.D. Jr. *SPE Form Eval* v 2 n 4 Dec 1987 SPE 14137, p 401-411.

**072944 MDW GAINS AS FORMATION-EVALUATION TOOL.** A comparison of measuring while drilling (MWD) and wire line methods as alternatives for formation evaluation is now pertinent. The recent addition of neutron porosity and formation density logs to the MWD logging suite has significantly advanced it as a tool for quantitative formation evaluation. Though wire line measurements are far from obsolete, their replacement by MWD is becoming more common, particularly in high-angle holes. This is the second article in a series of MWD. Some topics discussed are these: downhole environment, natural gamma radiation, formation resistivity, neutron porosity, formation density, the bit as a sensor, and MWD applications (thinly bedded pay, time lapse logging, and high angle wells. 25 refs

Vikram Rao, M. (NL Drilling Services, Houston, TX, USA); Fontenot, John E. *Oil Gas J* v 86 n 6 Feb 8 1988 p 44-48.

**072945 ACCELERATOR-BASED COMPENSATED EPITHERMAL NEUTRON POROSITY TOOL.** It is generally considered that a neutron porosity measurement made with 14 MeV neutrons will be inferior to one made with 4 MeV neutrons. This paper demonstrates that the conclusion is invalid. The response characteristics of a new tool are presented as are the results of field tests. The effects of changes in borehole size, standoff and lithology are similar to those for conventional thermal neutron porosity tools (for example, the CNT-K. The statistical uncertainty in the porosity estimate is as good as that of the CNT-K at medium porosities if a  $4 \times 10^8$  n/sec. source is used and smaller than the CNT-K at low porosities. Log examples show that the accelerator-based epithermal porosity estimate is generally close to that of the sidewall epithermal tools (for example, the SNL) and lower than that of the CNT-K. (Edited author abstract) 5 refs.

Gartner, M.L. (Gearhart Industries Inc, Austin, TX, USA); Schnoor, C.; Sinclair, P. *Log Anal* v 28 n 6 Nov-Dec 1987 p 528-537.

**072946 IMPROVED ENVIRONMENTAL CORRECTIONS FOR COMPENSATED NEUTRON LOGS.** The basic openhole responses and environmental correction algorithms for compensated neutron logging (CNL) tools have been updated. The improved processing is based on an extensive set of laboratory formation measurements to which mathematical modeling calculations have been added. In all, the new algorithms include basic responses for the three principal formation matrix

types and corrections for seven environmental effects and formation-fluid salinity. A total of 467 laboratory formation measurements have been augmented with 245 data points generated through mathematical modeling. This data base has been used to define more accurately the effects on the tool response of variations in logging conditions from those considered standard in the laboratory. (Edited author abstract). 11 Refs.

Galford, J.E. (Schlumberger Well Services, Sugar Land, TX, USA); Flaum, C.; Gilchrist, W.A. Jr.; Soran, P.D.; Gardner, J.S. *SPE Form Eval* v 3 n 2 Jun 1988 p 371-376.

**072947 DUAL-BURST THERMAL DECAY TIME LOGGING PRINCIPLES.** The dual-burst thermal-neutron-decay-time (TDT<sup>TM</sup>) tool brings two enhancements to pulsed-neutron capture logging. The first is a realistic physical model of pulsed neutron decay curves that accounts explicitly for the effects of neutron diffusion and decay in both the wellbore and the formation. The second is the dual-burst system itself, which permits excellent statistical precision with minimal dead-time losses. This paper discusses the physics of the model, operation of the tool, important mathematical considerations for optimum use of the tool, and a demonstration of the tool performance in a laboratory simulation of a log-inject-log (LIL) operation. (Author abstract). 11 Refs.

Steinman, D.K. (Schlumberger Well Services); Adolph, R.A.; Mahdavi, M.; Preeg, W.E. *SPE Form Eval* v 3 n 2 Jun 1988 p 377-385.

**072948 MACROSCOPIC THERMAL NEUTRON CAPTURE CROSS SECTION MEASUREMENTS.** The macroscopic thermal neutron-capture cross-section measurement in cased-well bores is discussed. The physical parameter measured is the formation capture cross section which is related to the type of fluid saturating the pore space. This measurement distinguishes between gas and water, gas and oil, and oil and water provided the water is saline. The physics of the measurement and the historical development of the instrumentation are reviewed. Important instrumentation elements are examined. The reasons for the limitation of the measurement to saline connate-water environments of modest to high porosity and simple lithology are listed and quantified. Current hardware and software developments that aim at more-sophisticated data acquisition and reduction are examined in detail. Other important applications such as production monitoring and enhanced-oil-recovery prospects are briefly discussed. 7 refs.

Jacobson, Larry A. (Gearhart Industries Inc, Austin, TX, USA). *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 817-821.

**072949 NEUTRON POROSITY MEASUREMENT WHILE DRILLING.** A measurement-while-drilling (MWD) neutron porosity tool has been designed that is superior to wireline porosity tools in several respects. Longer sample periods and greater porosity sensitivity reduce the statistical uncertainty in the MWD porosity measurement. Most of the borehole effects that perturb the measurement (salinity, mud weight, and borehole size) are reduced or nonexistent because the drill stem virtually fills the hole during drilling. Formation effects, lithology, and salinity changes, are comparable to or less than those for the wireline measurement. A sophisticated computer model was used to develop the initial design for this instrument and to estimate its response characteristics. Simulated response data are compared with experimental data to demonstrate the validity of the model. The response characteristics are superior to those of the wireline device. 4 refs.

Gartner, Michael L. (Gearhart Industries Inc, Austin, TX, USA). *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 839-843.

**072950 He<sup>3</sup> NEUTRON DETECTORS FOR HOSTILE ENVIRONMENTS.** The He<sup>3</sup> proportional counter is widely used for neutron detection in nuclear well-log-

ging tools, where high levels of thermal and mechanical stress are routine. The capabilities of these devices are summarized, and the chief mechanisms related to stable operation in the logging-tool environment are examined to provide some practical guidance to tool designers and users. The discussion covers charge output, He<sup>3</sup> proportional counter spectra, thermal neutron sensitivity, gamma sensitivity, temperature effects, and spurious signals. The use of integral decoupling networks is briefly considered. 3 refs.

Gjesius, Frederick (GE, Twinsburg, OH, USA); Kniss, Timothy. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 867-871.

**072951 SPECIFIC PURPOSE MONTE CARLO MODELLING OF NUCLEAR WELL LOGGING TOOL RESPONSES.** Statistical estimation and direction biasing combined with path-length stretching have been incorporated in special-purpose Monte Carlo codes for modeling pulsed-neutron and dual-spaced neutron well-logging-tool responses. Experimental test-pit results have been simulated with these codes, indicating that they are accurate. The codes are run on a DEC Microvax II computer in very reasonable CPU times and are easy to use. It is estimated that further optimization of the biasing parameters, inclusion of correlated sampling, and other improvements will yield computer codes that are about an order of magnitude faster than the present general-purpose codes. 13 refs.

**072952 APPLICATIONS OF THERMAL MULTIGATE DECAY PULSED NEUTRON LOGS IN UNUSUAL DOWNHOLE LOGGING ENVIRONMENTS.** The Thermal Multigate Decay (TMD) logging system utilizes a pulsed 14 Mev generator and two gamma ray detectors to obtain measurements of the capture cross sections of downhole formations. The composite decay curve from both formation and borehole capture gamma rays is detected, and is separated into the two individual components: sigma formation and sigma borehole. The resulting sigma formation measurement is only minimally affected by borehole conditions, especially in cased wells. The paper briefly reviews the TMD logging system and concentrates on log examples in unusual borehole conditions. (Edited author abstract) 8 refs.

**072953 NML - THE HOPE FOR PRODUCTION PREDICTION.** The nuclear magnetism log (NML) has recently been upgraded to a workable and reasonably trouble-free service. The most important parameter measured by the NML is the free-fluid index (FFI). The initial magnetization of the formation is a function of the number of aligned protons. The FFI can be of great value in estimating the potential productivity of reservoir rocks. It will be of particular value in cases where there are apparent dual-porosity systems with part of the porosity being microporosity that is saturated with immovable water. The FFI of the NML offers a way to determine whether the water saturation calculated from conventional well logs is truly irreducible or higher than irreducible water saturation. In practical terms, it presents a way to determine the productivity of the sandstone reservoirs with well logs. 4 refs.

**072954 STATISTICAL PRECISION OF NEUTRON-INDUCED GAMMA RAY SPECTROSCOPY MEASUREMENTS.** The statistics of neutron-induced gamma ray measurements performed in the borehole environment are affected by parameters such as borehole size and salinity, formation sigma, neutron-burst timing, and casing. By understanding how these parameters affect the statistical uncertainty, logging conditions can sometimes be optimized to produce better results. For example, the statistical uncertainty of the inelastic carbon-to-oxygen ratio is affected by the salinity in the borehole because of the increased capture background that is associated with the chlorine. The value of the carbon-to-oxygen ratio is not affected; only the precision to which it is determined is. For the capture measurement, the various parameters affect the partitioning of the signal coming from the borehole versus the formation; thus, the statistical uncertainty of the interpretation model is affected by the magnitude of borehole correction required. This paper shows how the statistics in the borehole spectroscopic measurement are propagated and how these statistics affect the interpretation models. (Author abstract) 16 refs.

**072955 TOTAL ORGANIC CARBON CONTENT DETERMINED FROM WELL LOGS.** Total organic-carbon (TOC) content present in potential source rocks significantly affects the response of various well logs. This paper discusses and illustrates well-log anomalies caused by TOC as observed on various wireline measurements, including resistivity (or conductivity), acoustic, nuclear (density and neutron), gamma ray, natural gamma ray spectra, and pulsed neutron [sigma and carbon/oxygen (C/O) ratio]. Field examples of these well-log responses in open and/or closed wellbores are presented from several counties. Several correlations between TOC and individual and/or combinations of various logging responses are also reviewed. (Author abstract) 27 Refs.

**072956 NUCLEAR MODELING TECHNIQUES AND NUCLEAR DATA.** A review of radiation transport techniques, useful in modeling nuclear oil-well logging applications, is presented. These techniques include deterministic and stochastic methods, in addition to sophisticated nuclear databases. Mathematical modeling minimizes design and experiment time and provides information on sensor design, environmental effects, and interpretation questions. Monte Carlo techniques provide energy, time, and spatial information to permit signal partitioning and sensitivity analysis in complex geometries and environments. Three examples of nuclear modeling are given. 49 refs.

**072959 OIL RECOVERY IN A LOW-PERMEABILITY, WAVE-DOMINATED, CRETACEOUS, DELTAIC RESERVOIR, BIG WELLS (SAN MIGUEL) FIELD, SOUTH TEXAS.** The Upper Cretaceous Big Wells (San Miguel) reservoir in Dimmit and Zavala Counties, south Texas, produces from a broadly lenticular, wave-dominated deltaic sandstone encased in prodelta and shelf mudstones. The reservoir is subdivided into an upper, nonproductive, transgressive shelf sandstone and a lower, productive, but intensely bioturbated, deltaic sandstone. The northward transition from thicker and cleaner sandstones of the beach-ridge plain to argillaceous sandstones within and adjacent to the distributary system strongly affects oil recovery from the field. Reservoir, permeability and induced-fracture half-lengths decrease dramatically to the north. Consequently, well performance peaks in the beach-plain sediments and decreases northward and updip and downdip into adjacent mudrier sediments. Recovery efficiencies of the original oil in place average 50% in the southern half of the pool and drop to 20-30% in the north. Additional aspects of the subject are discussed. (Edited author abstract) 23 refs.

**072960 PREDICTING LIQUID GRADIENT IN A PUMPING-WELL ANNULUS.** This work proposes a hydrodynamic model for estimating gas void fraction,  $f_g$ , in the bubbly and slug flow regimes. The model is developed from experimental work, involving an air/water system, and from theoretical arguments. The proposed model suggests that prediction of  $f_g$ , and hence the bottomhole pressure (BHP), is dependent on such variables as tubing-to-casing-diameter ratio, densities of gas and liquid, and surface tension. Available correlations do not include these variables as flexible inputs for a given system. Computation on a field example indicates that slug flow is the most dominant flow mechanism near the top of liquid column at the earliest times of a buildup test. As buildup progresses, transition from slug to bubbly flow occurs in the entire liquid column. (Edited author abstract) 40 refs.

**072961 THEORETICAL AND EXPERIMENTAL ANALYSIS OF MINIPERMEAMETER RESPONSE INCLUDING GAS SLIPPAGE AND HIGH VELOCITY FLOW EFFECTS.** This study introduces a geometrical factor which when substituted into a modified form of Darcy's law allows the computation of permeability from steady-state measurements of gas flow rate and injection pressure. This geometrical factor ( $G_p$ ), a function of injection tip-seal size and sample dimensions, is given for two basic flow geometries: (1) half-space flow as encountered

in outcrop measurements and (2) unconfined core plug flow for measurements taken on samples not held in a conventional Hassler sleeve device. Examination of  $G_p$ -factors for both flow patterns can estimate the depth of investigation for typical tip-seal dimensions. Experiments reveal that for certain ranges of sample permeability, the response of ten minipermeameter is affected by gas slippage and high velocity gas flow. The authors demonstrate how to correct for these effects on an example of a vertical sequence of measurements taken from a Page sandstone core. (Edited author abstract). 26 Refs.

## Cameroon

**072965 INSTALLATION OF THE CENTRAL PRODUCTION FACILITIES DECK FOR THE MOKOKO-ABANA FIELD, CAMEROON.** To reduce development costs at the Mokoko-Abana field, all production equipment was installed in deck units during fabrication and the equipment was precommissioned in the contractors' yards before loadout. The 5,000-ton [4500-Mg] central production facilities deck, however, exceeded lifting capabilities of available marine equipment, so a unique installation technique was developed that uses tidal changes and rapid barge ballasting to lower

the completed deck onto a specially designed jacket. (Author abstract)

**072968 COMPUTING IN THE UPSTREAM COMES OF AGE.** A discussion is presented of the advances in the use and control of information technology in oil exploration and production. The role played by the computer in oil exploration and production is discussed. The use of computers in electronic mail, seismology and structural engineering are briefly examined.

Mayhew, Geoffrey. *Pet Rev* v 42 n 493 Feb 1988 p 4-7.

**Control**

**072969 STUDY OF SUBCRITICAL FLOW THROUGH MULTIPLE-ORIFICE VALVES.** Increased oil and gas production from offshore areas and hostile environments has led to a greater use of multiple-orifice-valve (MOV) wellhead chokes. Unlike conventional wellhead chokes, MOV's can be adjusted to any given choke area while under pressure, allowing wells in remote locations to be controlled from a central site. Data on the behavior of multiphase flow through MOV chokes have not been available in the past. This study investigated high-pressure (400 to 800 psia [2.8 to 5.5 MPa]), two-phase air/water flow through a 2-in. [5.1-cm] MOV choke. Single-phase air and water data were obtained to determine the valve-sizing coefficient,  $C_v$ . A correlating parameter was determined with two-phase data to predict the subcritical two-phase pressure drop. This parameter was found to be a function of the gas/liquid ratio, upstream pressure, and choke opening. (Edited author abstract) 12 refs.

**072970 PLC'S ARE NOW PREFERRED IN MANY OIL-FIELD OPERATIONS.** In recent years, programmable logic controllers (PLC's) have evolved to such a point that in small control systems typical of oil field production operations, they are often technologically and economically preferred over hard-wired relays. Advantages of PLC's include reduced development and training time that is possible because of standardized development and documentation. The standardization also simplifies troubleshooting and spare part requirements. 3 refs.

**Control Systems**

**072971 ROUGHING IT IN REAL TIME.** The authors believe it takes a rugged computer to acquire and analyze data in real time when the conditions are as adverse as those in an oil field. In these extreme circumstances, a ruggedized smart computer system can be helpful in resolving difficult problems as they arise. A computer system to accomplish just that, developed for the petroleum industry, is described here, and various other applications are discussed, including the possibility of partial or complete automation of many operational tasks.

**Costs**

**072972 PACKERLESS SALTWATER DISPOSAL REDUCES OPERATING COSTS.** Since the free fall of oil prices in February 1986, dozens of marginal producing properties offered for sale have been studied. In evaluating these properties one common denominator was discovered—inefficient saltwater disposal systems. As a rule of thumb it costs as much to dispose of a barrel of salt water with pumps as it does to produce it. The answer to lowering operating costs with an improved saltwater system is relatively simple—replace the saltwater disposal pumps with a packerless gravity feed or vessel pressure system. Mastery of saltwater disposal has been hampered by three factors—neglect, costs, and regulatory requirements. The authors discuss tubing selection, swabbing operation, fluid level control, well cleanup and a well's Injunctivity Index.

**Economics** See Also OIL WELL DRILLING—Directional.

**072973 COST BENEFITS FROM MICROBIAL OIL WELL STIMULATION.** Microbial well stimulation is a technique that offers cost advantages over the conventional chemical treatments and is therefore of particular interest while the price of oil is low. Many classes of oilfield chemicals, including acids and solvents, are produced by micro-organisms grown on a cheap, fermentable sugar substrate. Some of these micro-organisms are capable of growth under the conditions prevailing in oil reservoirs, and the use of porous reservoir rock as a biological reactor offers enormous cost advantages over production of these bio-chemicals in conventional fermentation plants. To be of value for microbial oil-well stimulation, organisms must produce products to dissolve or dislodge metal scale or asphaltenes under reservoir conditions in the well bore region. Since the 1950s there have been some 200 field trials of microbial oil recovery treatments in the USA, Romania, the Soviet Union, Hungary, Poland and the Netherlands.

**072975 DIESEL-BASED GEL CONCENTRATE REDUCES STIMULATION COSTS.** A new liquid gel concentrate based on diesel (LGCD) has helped operators reduce oil well-stimulation costs. The gelled fracture fluid is mixed 'on the fly' from diesel-based liquid concentrate. Procedural changes made possible by use of the LGCD bring more efficiency and versatility, which result in better economy, to the fracturing operation. Examples are major savings due to lower treating pressure and pumping rates. Also, work reported by E.R. Simonson showed that lower treating pressure consistently yielded less fracture height and greater fracture length in formations of all types. 3 refs.

Harms, Weldon M. (Halliburton Services, Duncan, OK, USA); Yeager Randy. *Oil Gas J* v 85 n 44 Nov 2 1987 p 37-39.

**072976 EOR SURFACE FACILITIES FOR THE NORTH SEA.** Maximizing recovery of oil from the North Sea's huge reserves by utilizing enhanced oil recovery techniques is just beginning now that production has peaked and is starting to decline. It is estimated that primary and secondary recovery methods will yield 35 to 42% of the 60 billion barrels of original oil in place, and that tertiary (EOR) methods will recover an additional 5-40% of the original oil in place, depending upon the methods used, economics of production and technological advances. A brief review of EOR methods is presented with comments regarding their use in the North Sea. Descriptions of actual land-based projects for the most likely EOR methods to be used in the North Sea are discussed, and then judgements to applicability are offered. 34 refs.

**072977 REVIEW OF THERMAL OIL RECOVERY USING HORIZONTAL WELLS.** This report is a review of the state of the art of thermal oil recovery using horizontal wells for producing heavy oils and tar sands. The review includes a discussion of reservoir engineering, drilling, and completion aspects of horizontal well and drainhole technology. The available field data are also discussed. The review is restricted to the steam-horizontal well combination technology. The available data demonstrate that for tar sand oil recovery, steam assisted gravity drainage using horizontal wells is an efficient oil production mechanism. For heavy oil recovery, steam assisted gravity drainage as well as steam drive employed with horizontal wells seem to give substantially higher recovery than that obtained using vertical wells. In addition, in mature steam drives with significant steam override,

horizontal wells could be used to reduce gravity segregation and produce oil from the bottom layers. (Author abstract) 72 refs.

Joshi, S.D. (Phillips Petroleum Co, Bartlesville, OK, USA). *In Situ Oil Coal Shale Miner* v 11 n 2-3 Jun-Sep 1987 p 211-259.

**072978 EOR WITH PENN STATE SURFACTANTS.** Petroleum sulfonate surfactants were synthesized from C<sub>19</sub>, C<sub>22</sub> and C<sub>26</sub> feedstocks and evaluated in core tests for their ability to enhance oil recovery. All three feedstocks are composed predominantly of saturated paraffinic and naphthenic hydrocarbons. The C<sub>19</sub> feedstock includes about 12% aromatics. The hydrocarbons were vapor-phase oxidized at low temperatures to provide cyclic ethers, which subsequently were sulfonated to form a product mixture of mono-, di-, and trisulfonates. Corefloods were conducted with both sulfonates developed at Pennsylvania State U. and commercial sulfonates in Berea sandstone cores. High oil recovery efficiencies are realized when the Penn State sulfonates are used without cosurfactants to form dilute chemical slugs. (Edited author abstract) 19 refs.

Arf, T.G. (Pennsylvania State Univ, PA, USA); LaBelle, G.; Klaus, E.E.; Duda, J.L.; Nagarajan, R.; Biterge, M.B.; Ertekin, T. *SPE Reservoir Eng* v 2 n 2 May 1987 p 166-176.

**072979 HYDROLYSIS AND PRECIPITATION OF POLYACRYLAMIDES IN HARD BRINES AT ELEVATED TEMPERATURES.** The authors attempt to define some of these limits through an extensive series of cloud-point measurements for commercial polyacrylamides, coupled with data on the rate of hydrolysis as a function of temperature. These are combined to predict precipitation times as a function of hardness level and temperature, thereby providing guidelines for the use of polyacrylamides in EOR. Indications are that these cloudy solutions cause plugging of porous media. Therefore, a polymer solution is potentially useful only below its cloud-point temperature. 30 refs.

Moradi-Araghi, Ahmad (Phillips Petroleum Co); Doe, Peter H. *SPE Reservoir Eng* v 2 n 2 May 1987 p 189-198.

**072980 LABORATORY SEISMIC METHODS FOR REMOTE MONITORING OF THERMAL EOR.** Laboratory measurements of compressional (P) and shear (S) wave velocities and first-arrival amplitudes at ultrasonic frequencies in unconsolidated tar and heavy-oil sands indicate that wave-propagation properties in these materials are sensitive to bitumen content. The results suggest that seismic wave transmission and possibly reflection methods should be highly successful in locating thermal EOR fronts and in monitoring the distribution of heated tar and heavy oils within a reservoir. The application for this technique is evident: because of the potential to track heated oil remotely, field operators may be able to determine optimal placement of future production or injection wells. (Edited author abstract) 10 refs.

Tosaya, Carol (Petrophysical Services Inc); Nur, Amos; Vo-Thanh, Dung; Da Prat, Giovanni. *SPE Reservoir Eng* v 2 n 2 May 1987 p 235-242.

**072981 REMOTE MONITORING OF THE STEAM-FLOOD ENHANCED OIL RECOVERY PROCESS.** Cross-borehole seismic velocity and high-frequency electromagnetic (EM) attenuation data were obtained to construct tomographic images of heavy oil sands in a steam-flood environment. First-arrival seismic data were used to construct a tomographic color image of a 10 m by 8 m vertical plane between the two boreholes. Two high-frequency (17 and 15 MHz) EM transmission tomographs were constructed of a 20 m by 8 m vertical plane. The velocity tomograph clearly shows a shale layer with oil sands above it and below it. The EM tomographs show a more complex geology of oil sands with shale inclusions. The deepest EM tomograph shows the upper part of an active steam zone and suggests steam channeling just below the shale layer. These results show the detailed structure of the entire plane between boreholes and may

provide a better means to understand the process for in-situ heavy oil recovery in a steam-flood environment. (Author abstract) Refs.

Laine, E.F. (Lawrence Livermore Natl Lab, Livermore, CA, USA). *Geophysics* v 52 n 11 Nov 1987 p 1457-1465.

**072982 PRODUCTION FROM HORIZONTAL WELLS AFTER 5 YEARS.** The first of our horizontal wells drilled by Elf Aquitaine during the last 6 years produced its first barrel of oil in Aug. 1980. The others followed between 1981 and 1983. There is now enough production history to draw conclusions. It is found that success in drilling horizontal wells means compensating for additional costs with additional production. Reaching this target means carefully selecting potential candidates, improving the horizontal production, and reducing the additional cost. Selecting the candidates is the key point. The best fields for horizontal drilling might be reservoirs with widely spaced, vertical, permeable heterogeneities (fractures and karsts), tight gas with some fractures, and also severe water/oil or gas/oil interface deformation. Improving horizontal production depends on the lateral heterogeneity. It must be measured adequately and used in the selective completion of horizontal wells. (Edited author abstract) 11 refs.

Reiss, L.H. (Elf Aquitaine). *JPT J Pet Technol* v 39 n 11 Nov 1987 p 1411-1416.

**072983 APPLICATION OF HORIZONTAL WELLS AT PRUDHOE BAY.** This paper reviews production and reservoir engineering aspects of the trial program. It includes the objectives of the test program, the planning and drilling of three wells, the forecasting of production rates and recoveries, and the testing and analysis of actual well performance. In summary, the three wells have been successfully drilled and completed, with each well consisting less than its predecessor. The wells have exhibited productivities two to four times that of conventional comparison wells, and increased oil recovery is anticipated. (Edited author abstract) 13 refs.

**072984 DEVELOPMENT AND EVALUATION OF EOR POLYMERS SUITABLE FOR HOSTILE ENVIRONMENTS - PART 1: COPOLYMERS OF VINYL-PYRROLIDONE AND ACRYLAMIDE.** This paper describes the properties of synthetic water-soluble polymer that are stable for extended periods of time in hard brines at very high temperatures. Several copolymers of vinylpyrrolidone (VP) and acrylamide (AM) were prepared and evaluated in our laboratories for EOR application in hostile environments. VP in the copolymer composition protects AM against extensive thermal hydrolysis, which otherwise will result in loss of viscosity and precipitation. A range of VP/AM copolymer compositions was found to tolerate the harsh conditions of 250°F (121°C) in seawater for extended periods of time to be suitable for EOR application under these conditions. The results indicate that these copolymers can easily be injected into porous media and that they can be effective polymers for EOR application in hostile environments. (Edited author abstract) 13 refs.

**072985 CALCULATION OF MINIMUM MISCIBILITY PRESSURE.** An algorithm is presented for the calculation of the thermodynamic minimum miscibility pressure (TMMP) consistent with an equation-of-state (EOS)-based fluid description. This algorithm handles both condensing and vaporizing miscibility mechanisms. TMMP calculations are included for a ternary mixture of pure components, as well as a reservoir-oil/CO<sub>2</sub> system. (Author abstract) 7 refs.

Luks, Kraemer D. (Univ of Tulsa, OK, USA); Turek, Edward A.; Baker, Lee E. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 14929, p 501-506.

**072986 KINETIC STUDY OF THE DECOMPOSITION OF SURFACTANTS FOR EOR.** The effect of temperature, pH, surfactant purity, and air on the decomposition rate of two classes of surfactants typically used in steam EOR processes has been investigated. With synthetic alkylaryl sulfonates, isolation and characterization of the hydrocarbon reaction products established that the principal reaction is desulfonation of the surfactant. The kinetics of the decomposition of certain alkylaryl sulfonates under carefully controlled pH and temperature conditions are discussed and compared with the behavior observed for  $\alpha$ -olefin sulfonates (AOS's) under the same conditions. The synthesis and decomposition of key pure isomeric alkylaromatic sulfonates of known structure led to a mechanistic description of the decomposition reaction. (Edited author abstract) 14 refs.

**072987 NUCLEAR STEAM GENERATION FOR A SHENGLI FIELD EOR.** High-temperature nuclear-reactor (HTR) units are being considered to provide energy to generate steam for thermal recovery of oil in China's Shengli area. These reactors are particularly suited because they can be designed in small sizes, and they are extraordinarily safe. A two-phase study to determine the possible application of this technology is now under way. Begun in 1985, the preliminary feasibility study and evaluation of a steam-drive project with an HTR as the steam generator in Shanjasi field are scheduled to be completed in mid-1988. 3 refs.

**072988 TECHNOLOGY OF USING CARBON DIOXIDE TO INCREASE THE OIL OUTPUT OF FORMATIONS.** Carbon dioxide can be used to increase the oil output of formations in a wide range of variations of the geological and physical conditions in any stage of development of oil fields. The method is most effectively introduced when the technology for working the field is correctly chosen. This is possible after carrying out laboratory studies, calculations and experiments on a small section of the field involved. Further studies of the method are required concerning ways of controlling the rate of advance of the injected fluids through the formation, preventing premature breakthroughs of CO<sub>2</sub> into the extraction wells, recovering the CO<sub>2</sub> extracted with the oil, and creating the equipment required for successful realization at the process. In Russian. 6 refs.

**072989 SARAH-DIEZOL: UN SYSTEME DE DIAGNOSTIC EN RECUPERATION ASSISTEE D'HYDROCARBURES.** [Sarah-Diezol: A Diagnosis System for Enhanced Oil Recovery]. This article describes a system for selecting possible enhanced oil recovery (EOR) processes on the basis of reservoir data. The method is based on an expert system shell (DIEZOL) developed by Institut Francais du Petrole (IFP). The reasoning uses backward and forward chaining, confidence factors and procedure attachments. This approach is considered to play a role in establishing a methodology for choosing an EOR process, for improving known-how by checking the criteria used by comparison with practical experience, and for transferring expert's knowledge to users of the system. (Edited author abstract) In French. 23 refs.

**072990 FOURTH SPE COMPARATIVE SOLUTION PROJECT: COMPARISON OF STEAM INJECTION SIMULATORS.** Three related steam injection problems are presented along with simulation results for them obtained from six organizations. The problems

selected for comparison were intended to exercise many of the features of thermal models that are of practical and theoretical interest. The first problem deals with three cycles of cyclic steam injection and the other two problems deal with steam displacement in an inverted nine-spot pattern. The first two problems are of 'black-oil' type and the third of compositional type. Complete data are presented for these problems. The comparison of solutions indicates good agreement for most of the results of importance in field operations. (Author abstract) 27 refs.

**072991 HOW CALIFORNIA OPERATORS IMPROVE HEAVY OIL PRODUCTION.** The main attraction at Kern River is the big cogeneration project that sits on 20 acres atop Omar Hill in the center of the field. It produces 300 mw of electricity as well as 131,000 b/d of steam. Another 45 to 50 conventional steam generators will be replaced at Kern River by a second cogeneration facility currently under construction a little more than a mile west of the Omar Hill plant. Another cogeneration facility is being built near the Midway-Sunset oil field in the San Joaquin Valley. Heavy oil production is also being enhanced by the use of the Chaser additive in cyclic steaming applications. Hot water flood is yet another method being used to improve recovery at the Kern River field.

McNally, Rich (Petroleum Engineer Int, Dallas, TX, USA). *Pet Eng Int* v 59 n 11 Nov 1987 p 17-20.

**072992 IMPROVED INTERPRETATION OF THE INACCESSIBLE PORE-VOLUME PHENOMENON.** In laboratory corefloods, polymer solutions used in EOR, such as partially hydrolyzed polyacrylamides (HPHA), often break through at less than 1 PV injected compared to the breakthrough of pure water. The rapid breakthrough is erroneously used to determine the ratio of pores accessible to polymer to total PV (accessible PV). Through numerical simulation and steady-state analysis, we show that the rapid breakthrough of such polymer solutions is not a measure of accessible PV. Our results significantly affect interpretation of polymer flow in porous media. We show two different forms of the same partial differential equation used to describe rapid polymer breakthrough. The finite-difference solutions lead to two different polymer concentrations for each gridblock - a flowing concentration and a bulk (volume-average) concentration. The polymer-concentration-dependent properties required for each formulation must be interpreted correctly. (Edited author abstract) 7 refs.

**072993 GEOLOGIC PROBLEMS RELATED TO CHARACTERIZATION OF CLASTIC RESERVOIRS FOR EOR.** Geologic problems encountered in four U.S. DOE-sponsored EOR projects in clastic reservoirs were analyzed. The reservoir heterogeneities were grouped into four categories: depositional, diagenetic, structural, and formation-fluid composition/distribution. Each category had a variable effect on the performance of the EOR projects. Requirements for developing one static geologic model for each category of heterogeneity are proposed. The interrelationship of geologic factors and the effect of heterogeneities resulting from the origin and timing of geologic events are described. (Edited author abstract) 80 refs.

**072994 ANALYSIS OF AN INTERWELL TRACER TEST IN A DEPLETED HEAVY-OIL RESERVOIR.** This paper presents field data and analyses of an interwell tracer test conducted in the Niitsu oil field, which is a fully depleted heavy-oil reservoir of unconsolidated sand formation. Water containing a chemical tracer was injected

at a constant rate into an injector surrounded by three production wells. Effluent analyses showed very early breakthrough of injected water at two of the producing wells. The test results suggest a strong areal heterogeneity of the tested formation. An appropriate analytic model was used to obtain a preliminary interpretation of the results. A modified three-dimensional (3D) black-oil model developed to simulate the polymer flood process was then used for analyzing the data in more detail. The model treats tracer solution as a fourth component and can also account for adsorption of tracer. (Edited author abstract) 9 refs.

**072995 WATER CONTENT OF CO<sub>2</sub> IN EQUILIBRIUM WITH LIQUID WATER AND/OR HYDRATES.** Experimentally measured water content in CO<sub>2</sub>-rich fluid in the gaseous or liquid state in equilibrium with liquid water or hydrate is presented for pressures ranging from 100 to 2,000 psia [0.69 to 13.79 MPa] and temperatures from -19 to 77°F [-28.33 to 25.0°C]. The water content of the CO<sub>2</sub>-rich phase along the three-phase equilibria, i.e., liquid water/liquid CO<sub>2</sub>/gas to the three-phase critical endpoint, is also reported. The experimental results from this study on the water content in the CO<sub>2</sub>-rich phases have been combined with earlier research results of the CO<sub>2</sub>/water binary system in the hydrate-free region from 77 to 200°F [25.0 to 93.3°C] and pressures to 3,000 psia [20.69 MPa] to produce a comprehensive plot. **072996 MATHEMATICAL MODELING OF THE ONE-DIMENSIONAL PROCESSES OF OIL DISPLACEMENT BY AN ACTIVE SOLUTION.** The previously proposed model of oil displacement by an active solution is extended to the case in which the relative phase permeabilities depend on the percolation velocity and interfacial tension as functions of the active agent concentration. For this purpose the phase permeability curves are approximated by functions of two variables - saturation and capillary number. An analytical description of the structure of the displacement zone in an extended stream tube of variable cross section is given for continuous pumping of the active solution and the use of a finite batch (slug). The coefficient of displacement of the oil from the near-well zone and an annular element of the reservoir is calculated by a finite-difference method for various operating conditions. This approach could be useful in analyzing the efficiency of different methods of improving oil recovery. (Author abstract) 20 refs.

**072997 ANALYZING, SOLVING OFFSHORE SEAWATER INJECTION PROBLEMS.** Adma-Opeco injects some 433,000 bpd of treated seawater into 10 reservoirs in the two fields through mostly dual completed wells. Main cause of injectivity deterioration is the treated seawater. Deterioration was initially noted while monitoring injection performance. A study to determine suitability of water quality specifications to the reservoirs showed that removal of particles larger than 2 microns is necessary. Factors relating to completion damage and problem control are discussed. 6 refs.

**072999 SOLUBLE FLUID-LOSS ADDITIVES CAN REDUCE WELL PRODUCTIVITIES AND PREVENT COMPLETE GRAVEL PLACEMENT.** Examples of wells indicating this effect during post-gravel-pack acid treatments are discussed. The theory of why this occurs and calculations of pressure drops through perforations filled with fluid-loss additives are presented. It has also been found that excess fluid-loss additives prevent complete coverage of a zone with gravel, because of either inadequate leakoff to the formation or partial plugging of the screen. Therefore, it is imperative that these additives be removed by acid, water, or solvents preceding the gravel slurry; however, if their removal causes loss of circulation, the results may be equally bad. (Edited author abstract) 7 refs.

**073000 UNDERBALANCED PERFORATION CHARACTERISTICS AS AFFECTED BY DIFFERENTIAL PRESSURE.** Underbalanced, tubing-conveyed completions are increasing because of the apparent advantages of cleaner perforations, reduced completion times, and stimulation treatments. Radial-flow Berea sandstone core specimens are used to determine the perforation characteristics resulting from time-dependent pressure differentials between core pressure and wellbore pressure during the completion process. The primary perforation characteristic studied [radial flow ratio (RFR)] is defined as the ratio of the perforated flow rate to the flow rate of the unperforated core. The perforation flow tests included pressure differentials from 500 psi [3450 kPa] overbalanced to 1,000 psi [6900 kPa] underbalanced, with immediate or delayed surging. The RFR was affected most by the 500-psi and 1,000-psi [3450- and 6900-kPa] underbalance. The surged RFR's were from 50 to 58% greater than the no-surge RFR's. (Edited author abstract) 10 refs.

**073002 EXPERIMENTAL INVESTIGATION OF HYDROCARBON RECOVERY FROM A POROUS MEDIUM BY CONTINUOUS STEAM INJECTION.** Experiments were carried out to recover oils by steam flooding a previously waterflooded core maintained at room temperature (21°C), 71.5°C and steam temperature (143°C), using continuous steam injection in an unconsolidated core containing oils of different viscosity. Primol, light paraffin and heavy paraffin, under varying heat loss conditions. In an actual petroleum reservoir, the injection of steam results in heat loss situations represented by all of the conditions used in this investigation on a stage-wise basis. Results indicate that the steamflood residual oil saturation is a highly variable quantity and any estimate of it must take into account the prevailing heat losses. The

overall recoveries of Primol, light paraffin and heavy paraffin were found to be 62, 31 and 65% of the waterflood residual oil saturations. (Author abstract) 13 refs.

**073004 DENVER UNIT CO<sub>2</sub> FLOOD: MATERIAL ASPECTS OF THE DESIGN AND OPERATION OF INJECTION AND PRODUCTION FACILITIES.** CO<sub>2</sub> flooding technology in conjunction with the development of large new natural sources of CO<sub>2</sub> has advanced to become a significant factor in the enhanced oil recovery scene. Shell Western E&P Inc. (SWEPI) initiated a large scale tertiary recovery CO<sub>2</sub> project in West Texas at the Denver Unit in April, 1983. The detrimental effects of CO<sub>2</sub> on many non-metallic materials and of carbonic acid on metallic materials has had a significant effect on selection of equipment for CO<sub>2</sub> flooding at the Denver Unit. This article reviews materials selection and the operating performance of these materials in the injection and production facilities at the Denver Unit.

**073006 CO<sub>2</sub> PRODUCTION IN GASIFICATION-COMBINED-CYCLE PLANTS.** Great reserves of known oil deposits remain in the ground because they cannot be extracted by conventional techniques. Injecting carbon dioxide (CO<sub>2</sub>) into oil reservoirs is one means of recovering some of those deposits when the market price of crude oil warrants the additional production costs. When oil prices were above \$25/bbl, CO<sub>2</sub> was a valued commodity in the oil industry, which looked to electric utilities as a potential supplier. But recent drops in oil prices caused less interest in such recovery methods, particularly at the high cost of CO<sub>2</sub> extracted from conventional power plant stacks. However, CO<sub>2</sub> could be produced most economically by utilities if it were coproduced with electricity at coal gasification-combined-cycle (GCC) power plants. An EPRI study of two GCC plants indicates the costs might make CO<sub>2</sub>-enhanced oil production economical even at today's oil price (about \$20/bbl). (Edited author abstract)

**073008 NEW STABILITY THEORY FOR DESIGNING GRADED VISCOSITY BANKS.** This paper presents a newly-developed theory which is based on the small perturbations method. In particular, a dimensionless number which is a function of the dimensions of the porous medium as well as the properties of the fluids and the porous medium and its critical value for the onset of viscous fingering is derived. With the help of this dimensionless number, it is possible to design a graded viscosity solvent bank which is able to resist the adverse effects of viscous fingering. The theory enables the prediction of the minimum size and configuration of a graded viscosity bank so as to maximize recovery by avoiding bank breakdown due to viscous fingering. (Edited author abstract) 19 refs.

**073009 MULTIPLE CONTACT PHASE BEHAVIOUR IN THE DISPLACEMENT OF CRUDE OIL WITH NITROGEN AND ENRICHED NITROGEN.** Phase behavior tests carried out on a Nisku crude oil (a candidate reservoir for nitrogen flooding) with nitrogen and nitrogen mixed with carbon dioxide or propane. These measurements were carried out in a batchwise multiple contact mode to simulate what occurs when gas displaces oil in a porous medium. None of the mixtures achieved miscibility with the oil in four contacts at pressures up to 35 MPa. Nitrogen and methane were exchanged between the gas and oil phases in an almost 1:1 ratio, while gas enrichment with C<sub>2-5</sub> hydrocarbons proceeded at a much slower pace. The experimental data were matched using the Peng-Robinson equation of state. The largest deviations were in the amount of heavy ends found in the vapor phase. (Edited author abstract) 10 refs.

**073010 MOBILITY CONTROL IN WATER-FLOODING OIL RESERVOIRS WITH A BOTTOM-WATER ZONE.** Many oil reservoirs in Alberta and Saskatchewan have a bottom water zone which leads to poor areal and vertical sweeps under a waterflood. Performance in such reservoirs could be improved if an effective method of partially plugging the bottom water zone can be implemented. A possible means of accomplishing this would be to precede the waterflood with a slug of a mobility control agent. This possibility was investigated using a laboratory flow model for polymer, emulsion, biopolymer, and foam mobility control agents in various slug sizes. Core flood experiments were conducted to study the effect of permeability contrast, relative oil-water layer thickness, oil viscosity, injection rate, slug size and the use of an artificial barrier. Oil of viscosities ranging from 1 to 200 mPa.s were used in 42 displacement tests. A qualitative comparison is made to show the relative merits of different mobility control agents. (Edited author abstract) 49 refs.

**073011 LABORATORY EVALUATION OF CROSSLINKED POLYMER AND ALKALINE-POLYMER-SURFACTANT FLOOD.** This paper discusses the feasibility of using crosslinked polymer technology

and alkaline-polymer-surfactant technology to improve oil recovery in the Grand Forks Lower Mannville D pool in Alberta. The results of laboratory studies indicate that the alkaline-polymer system can recover incremental oil over waterflooding of approximately 30% of original oil in place. With an addition of 0.1% by weight of surfactant, up to 47% of original oil in place can be recovered. No injectivity and fluid incompatibility problems were detected. The test results also indicate that the residual resistance factor can be increased by crosslinking. This should help improve the vertical sweep efficiency by diverting the subsequent injection fluids into the unswept zones. It is concluded that chemical flood is technically feasible for the pool. (Edited author abstract) 9 refs.

**073015 EFFECT OF AN INITIAL GAS CONTENT ON THERMAL EOR AS APPLIED TO OIL SANDS.** This paper discusses the results of a number of physical model experiments on thermal EOR. Seven experiments were performed, three in which a 'dead' heavy oil was used, and four in which the oil sand was saturated with methane. For oils without an initial gas content, coinjection of CO<sub>2</sub> with steam was capable of improving oil recovery over that obtained with steam alone. When an initial dissolved gas was present, coinjection of CO<sub>2</sub> was not beneficial. Injection of CO<sub>2</sub> or CH<sub>4</sub> slugs just before steam injection was beneficial in increasing oil recovery for experiments where an initial dissolved gas was present. (Author abstract). 9 refs.

Frauenfeld, T.W.J. (Alberta Research Council, Can); Ridley, R.K.; Nguyen, D.M. *JPT J Pet Technol* v 40 n 3 Mar 1988 SPE 15086, p 333-338.

**073016 ENGINE-EXHAUST GAS OFFERS ALTERNATIVE FOR EOR.** The use of processed engine-exhaust gas as an injection fluid has proven to be an economic success in several site-specific EOR projects. The energy released in producing the inert gas is converted into mechanical energy, and the water in the combustion process is removed by waste heat from the exhaust gas. To provide a noncorrosive gas prior to reaching injection pressure, certain elements, (e.g., water, oxides of nitrogen, oxygen) must be removed. Generally, the air/fuel ratio to the engine is controlled to produce a minimum amount of combustibles and oxygen in the exhaust. Exhaust gas is treated to remove NO<sub>x</sub> and O<sub>2</sub> through a proprietary catalyst system and then dried between stages of compression.

Hlozek, Robert J. (Production Operators Inc, Houston, TX, USA). *Oil Gas J* v 83 n 13 Apr 1 1985 p 75-78.

**073017 NUMERICAL INVESTIGATION OF THE PROCESS OF DISPLACEMENT OF OIL BY STEAM.** A calculation model of the process of displacement of oil by steam, based on the equations of three-phase nonisothermal flow with allowance for phase transitions in the water-steam system, is proposed. This model is used for the numerical investigation of the recovery of oil from water-oil zones by means of steam injection. The extraction of oil from water-oil zones is one of the difficult problems of the theory of exploitation of petroleum deposits. The presence of two zones with sharply different fluid resistances leads to considerable nonuniformity in production rates. It is shown that injecting steam significantly reduces this nonuniformity. (Author abstract) 6 refs.

**073018 POLYMERIZATION IN SUPERCRITICAL CO<sub>2</sub> TO IMPROVE CO<sub>2</sub>/OIL MOBILITY RATIOS.** The purpose of this work is to investigate the use of polymers to enhance the CO<sub>2</sub> phase viscosity. It is, however, different from the of Heller's work in that an attempt will be made to find monomers that are soluble in CO<sub>2</sub> under conditions similar to reservoir conditions. An initiator will then be added to the mixture in an attempt to generate a polymerization reaction. If a monomer can be polymerized and if the resulting polymer is soluble in the CO<sub>2</sub>, then the viscosity of the resulting mixture would be evaluated to determine whether it is higher than that of the pure CO<sub>2</sub> viscosity. If the viscosity can be raised by a factor of 20 to 30, then substantial improvement in sweep efficiency would be achieved. 25 refs.

**073021 INFLUENCE OF AN ELECTRIC FIELD ON THE INTERFACIAL PARAMETERS OF A WATER/OIL/ROCK SYSTEM: APPLICATION TO OIL ENHANCED RECOVERY.** Experimental work was carried out to determine the influence of electrochemical phenomena on the interfacial tension and wettability parameters of three water/oil/rock systems. The reactions of the electrolysis products of brine on the carboxylic acids of oil were shown to result in the formation of surfactants directly at the water/oil interface. Their effect was to reduce significantly the interfacial tension and, in some cases, to modify the solid-liquid interactions. Applications of this phenomenon have been considered, especially as a method for enhanced oil recovery. (Author abstract) 28 refs.

**073022 DISPLACEMENT OF OIL BY CARBON DIOXIDE AND WATER UNDER VARIOUS GEOLOGICAL AND PHYSICAL CONDITIONS.** It is shown that, depending on the oil viscosity and the degree of inhomogeneity of the formation, alternating injection of CO<sub>2</sub> and water with eight or more cycles yields the same technological indices as combined injection of carbon dioxide and water with the same reagent concentration in the flow. In a homogeneous formation the dependence of the oil output increase on the oil viscosity has a characteristic minimum, in agreement with experimental data. In formations with medium and strong inhomogeneity, the additional oil output is fairly high for low-viscosity oils, but it decreases with an increase in viscosity. In the case of low-viscosity oils the effectiveness of the method is higher when the injected mixture contains a large proportion of CO<sub>2</sub>. With an increase in the oil viscosity the additional oil output in an inhomogeneous formation increases with a decrease in this proportion. In Russian. 6 refs.

**073023 TRANSVERSE DISPERSION IN SLUG-MODE CHEMICAL EOR PROCESSES IN STRATIFIED POROUS MEDIA.** Transverse dispersion in multilayered media of moderate permeability contrast has been examined experimentally and theoretically. Continuous and slug-mode displacements at unit and nonunit mobility ratios have been conducted in a layered beadpack model with a permeability contrast of approximately 3:1. Layer-width and residence-time effects have been quantified and scaled to core and reservoir dimensions. Transverse dispersion can be significant for reservoirs with layers less than 100 cm [40 in.] thick and

core material with layers less than 1 cm [0.4 in.] thick. The data can be used for validating simulation packages written for chemical dispersion. (Author abstract) 16 refs.

**073024 EFFECTS OF RESERVOIR HETEROGENEITY ON CHEMICALLY ENHANCED OIL RECOVERY.** A three-dimensional (3D), multiphase, multi-component micellar/ polymer flooding simulator has been used to investigate the process performance under different conditions of reservoir heterogeneity (stratifications) and mobility ratios. The significance of crossflow has been studied by relating chemical flood recoveries to the effective length-to-thickness ratio and the transverse dispersion number of the reservoir. A long-standing question in micellar/ polymer flooding concerns whether small, high-concentration chemical slugs are preferred to large lower-concentration slugs. This aspect of slug size vs. slug concentration has been studied in 3D in the presence of heterogeneity. (Edited author abstract) 22 refs.

Gupta, Akhil Datta (Standard Alaska Production Co); Pope, Gary A.; Sepehrnoori, Kamy; Shook, Mike. *SPE Reservoir Eng* v 3 n 2 May 1988 SPE 14889, p 479-488.

**073025 EVALUATION OF MICROBIAL SYSTEMS IN POROUS MEDIA FOR EOR.** The use of microorganisms to enhance oil recovery has become a technically feasible technology for production from stripper wells (those that produce less than 10 B/D [1.6 m<sup>3</sup>/d]). As a result of microbial growth and the production of CO<sub>2</sub> and/or chemicals, oil recovery can be effectively increased in certain reservoirs with temperatures and salinities hospitable to microorganisms. Research at the Natl. Inst. for Petroleum and Energy Research has led to development of laboratory facilities for evaluating microbial systems for microbial enhanced oil recovery (MEOR) applications. Results from microbial core studies using Berea sandstone have shown that bacteria can vary greatly in their ability to recover residual oil after waterflooding, giving from 7.5 to 71% recovery efficiency. (Edited author abstract) 10 refs.

**073026 MINIMUM MISCIBILITY PRESSURE PREDICTION WITH EQUATIONS OF STATE.** Prediction of the minimum miscibility pressure (MMP) of the vaporizing gas drive (VGD) process is modeled by use of an equation of state (EOS) with different mixing rules joined with a newly formulated expression for the unlike three-body interactions between the injection gas and the reservoir fluid. The comparison of the numerical results with the available experimental data indicates that an EOS alone overestimates the MMP. When the EOS is joined with the correct version of the van der Waals mixing rules and the unlike three-body interaction term, however, the MMP will be predicted accurately. (Author abstract) 16 refs.

**073027 INVESTIGATION OF FOAM STABILITY IN POROUS MEDIA AT ELEVATED TEMPERATURES.** A laboratory study is described of the factors controlling the formation and breakdown of foams in porous media at elevated temperatures. The degradation of a foam when gas injection was discontinued involved the gradual transformation of a foam with a noncondensable gas phase (gas foam) to a foam with steam as the gas phase (steam foam). The ability to prevent release of the noncondensable gas phase was strongly influenced by surfactant type and concentration. The formation of steam foams in the absence of noncondensable gas was a critical function of steam velocity and permeability. Surfactant

concentration and chain length, salinity, and the presence of oil were important variables in determining mobility reduction of steam. (Edited author abstract) 24 refs.

Isaacs, E. Eddy (Alberta Research Council, Can); McCarthy, F. Clare; Maund, J. Darol. *SPE Reservoir Eng* v 3 n 2 May 1988 SPE 15647, p 265-272.

**073028 MECHANISMS OF FOAM GENERATION IN GLASS-BEAD PACKS.** The fundamental, pore-level mechanisms of foam generation are investigated in mono-disperse bead packs. First, direct visual observations identify the following generation mechanisms: lamella leave-behind, gas-bubble snap-off, and lamella division. Then, to ascertain the relative importance of these mechanisms, quantitative experiments are pursued on the role of bead-pack permeability (bead sizes from 0.25 to 1 mm, gas-phase velocity, gas-phase fractional flow, permeability variations, and surfactant type. A simple model, based on the concept of a 'germination site', is developed to predict the onset of snap-off at higher gas velocities. (Edited author abstract) 26 refs.

**073029 LABORATORY INVESTIGATION OF HIGH-TEMPERATURE SURFACTANT FLOODING.** Experiments were conducted to evaluate the use of surfactants for improving heavy-oil recovery from the hot-water zone in a steamflood. Criteria used to screen surfactants for this high-temperature application included thermal stability, interfacial activity, and surfactant flood performance. The thermal stabilities of several classes of sulfonate surfactants were measured. Surfactants exhibiting no thermal decomposition at elevated temperature (500°F) were identified. The phase behavior between heavy crude oil and surfactant solution was determined over a temperature range from 150 to 350°F. Regions of high interfacial activity were generated by the addition of salt to the brine phase. Interfacial tension (IFT) measurements confirmed the high salinity requirement of the selected surfactant/brine/oil system at elevated temperature. (Edited author abstract) 30 refs.

Ziegler, V.M. (Chevron Oil Field Research Co). *SPE Reservoir Eng* v 3 n 2 May 1988 SPE 13071, p 586-596.

**073030 SURFACTANTS FOR EOR: OLEFIN SULFONATE BEHAVIOR AT HIGH TEMPERATURE AND HARDNESS.** The surfactant properties usually required for EOR are investigated with alpha-olefin sulfonates (AOS's), particularly at high temperature, salinity, and hardness, together with their solubility in brine, chemical stability, phase behavior, and adsorption. The use of a cosolvent enables aqueous solutions to be prepared with concentrated brine, even at high divalent cation levels. But the chemical stability of some solutions can be affected by their sensitivity to the oxidation of unsaturated components, resulting in a decrease of the pH. Precautionary measures to stabilize the solutions are stressed - i.e., anaerobic environment, maintenance of an alkaline pH, or addition of alcohol. (Edited author abstract) 26 refs.

**073031 EFFECT OF WETTABILITY ALTERATION ON WATER/OIL RELATIVE PERMEABILITY, DISPERSION, AND FLOWABLE SATURATION IN POROUS MEDIA.** Wettability alteration was shown to affect strongly water/oil two-phase flow behavior in Berea and Loudon reservoir cores. Two examples of wettability alteration were realized by core aging and core extraction. With a steady-state method coupled with tracer analyses, these changes in wettability were shown to affect relative permeabilities, dispersivities, and flowable saturations in the cores. The changes in wettability were also confirmed by waterfloods and spontaneous-imbibition tests. Dispersion in steady-state two-phase flow was found to be a strong function of saturation and wettability.

ity. Dispersivity of each phase increases with decreasing phase saturation. Flow of the nonwetting phase was dispersed much more than that of the wetting phase. (Edited author abstract) 17 refs.

**073032 INVESTIGATION OF THE PARAMETERS OF MECHANICAL STRESS WAVES IN A SATURATED POROUS MEDIA.** The parameters of stress waves occurring during an electrical explosion in a saturated porous medium were investigated. The mechanical stresses in a model of an oil reservoir were recorded, and the regularities of the change in the amplitude of stress in porous medium in comparison with the regularities in the change in the amplitude of pressure in water were evaluated. The effect of an electrical explosion on the change in permeability of the reservoir model was determined. The results of the investigations permit recommending the creation of an electroexplosive device for reservoir stimulation. (Author abstract) 5 refs.

**073034 ANALYSIS OF THE LOW-TENSION PILOT AT BIG MUDDY FIELD, WYOMING.** Conoco Inc. initiated a low-tension pilot test in 1973 at the Big Muddy field east of Casper, WY. The process mobilized an oil bank ahead of the slug, reached a peak oil cut of 20 percent, and recovered 36 percent of the residual oil saturation (ROS). Tracers were injected in the preflush and postflush to determine swept volumes and distributions of flow. Tracer responses showed that more than 95 percent of the flow to the center well of the five-spot came from the two northern injection wells. The overall performance of the pilot was analyzed with a numerical simulator. As a result of the pilot and the supporting research, a nearby 90-acre [36.4-ha] commercial demonstration low-tension flood was initiated in 1980 and was operated as an EOR project until July 1985, although oil production still continues. (Author abstract) 13 refs.

**073035 EOR PAYING OFF IN PREMIAIN BASIN.** With five workover rigs running 7 days a week, Chevron U.S.A. is on a schedule that will have 87 water-injection wells at the North Ward Estes field converted for carbon dioxide injection during 1988 as part of Stage 1 of a three-stage enhanced oil recovery project. Additional wells will be converted during 1989. Another major CO<sub>2</sub> project reaching full stride is Amoco Production Co.'s effort to produce more oil from reservoirs in four West Texas units - three in the Slaughter field southwest of Lubbock (Slaughter Estate, Central Mallet, and Frazier) and one in the Wasson field near Denver City (Wasson ODC).

McNally, Rich (Petroleum Engineer Int, Cleveland, OH, USA). *Pet Eng Int* v 60 n 7 Jul 1988 p 34-36.

**073036 DRAINAGE PERFORMANCE AND CAPILLARY-PRESSURE CURVES WITH A NEW CENTRIFUGE.** A new centrifuge has been used to measure the drainage performance and the drainage capillary-pres-

sure function,  $P_c$  of various rock samples. The permeabilities of the rocks used for this study range from 0.1 to 700 md. A unique feature of the apparatus is that the rock sample is always in contact with the wetting phase at the outlet face so that the saturation boundary condition is known at this end. The drainage performance and  $P_c$  data for a variety of reservoir rock samples reported in this paper are expected to provide the basis for added insight into the drainage of oil from porous media. (Author abstract) 14 refs.

**073037 CROSSLINKED GELLED WATER IS OPTIMUM FRACTURE FLUID FOR SPRABERRY TREND IN WEST TEXAS.** Cumulative production data indicate that crosslinked gelled water is the optimum fracturing fluid for the Spraberry trend in West Texas. When different pump rates for crosslinked gelled water are used, lower rates appear to be optimum even though there is no consistency with higher rates. Several different proppant types and concentrations have been used in crosslinked gelled water treatments. It was found that oil production declines as higher proppant concentrations are pumped.

Hoel, Mark (Smith Energy Services, Midland, TX, USA). *Oil Gas J* v 86 n 33 Aug 15 1988 p 60-62,64,69.

**073038 REDUCTION OF POLYMER ADSORPTION ON RESERVOIR ROCKS.** The adsorption properties of polyacrylamides and xanthans on mineral surfaces carrying silanol and aluminol groups such as sand and kaolinite are described. The influence of the main parameters such as the nature of adsorption sites, surface charge, chemical structure and conformation of polymer and interactions of mono- and divalent ions with polymer and mineral surface has been investigated and interpreted. Some operating parameters in polymer flooding such as pH and salinity of the injected solution, the nature of the polymer and its degree of ionicity were found to be determining factors from the adsorption level. The results give key elements for reducing adsorption by a proper choice of the nature and ionicity of the polymer and of injection conditions. (Edited author abstract) 23 refs.

**073039 VINYL SULFONATE/VINYL AMIDE COPOLYMERS AND DIFFERENT SURFACTANTS AS SUITABLE SYSTEMS IN EOR AT HIGHER TEMPERATURES AND SALINITIES.** The aim of the present article is to demonstrate the influence of alkylphenol ethoxylates and their corresponding ether sulfonates on VS/VA/AM copolymer solutions. Aqueous solutions of such copolymers were added to varying quantities of nonionic and anionic surfactants at different temperatures using salinity scans. This article discusses the results of experiments with solutions of copolymers and surfactants in terms of compatibility, viscosity yield, flow properties, shear stability, injectability, thermostability, and oil recovery. Solutions of alkylphenol ethoxylates and/or ether sulfonates show nearly the same compatibility within a broad range of temperature and salinity, both with and without polymers. Relatively small amounts of surfactants are able to influence the EOR (Enhanced Oil Recovery) properties of the polymer solutions, giving several interesting aspects for improved oil recovery. (Edited author abstract) 10 refs.

**073040 EFFECTS OF RELATIVE PERMEABILITY CHARACTERISTICS AND THERMAL CONDUCTIVITY ON IN SITU COMBUSTION PERFORMANCE.** A thermal simulator was used to simulate a laboratory in situ combustion run. Comparison between simulated and laboratory results shows that the simulator is adequate for this study. Results from the simulation study show that in situ combustion performance is sensitive to relative permeability characteristics and to the thermal conductivity of the formation. These parameters affect the amount of fuel available for combustion. This process, in turn, affects the recovery and air requirement for in situ combustion projects. (Edited author abstract). 10 Refs.

**073041 TIRRAWARRA AND MOORARI ENHANCED OIL RECOVERY PROJECTS - 'GETTING MORE OIL OUT FROM DOWN UNDER'.** The Tirrawarra and Moorari oilfields are located in the South Australian portion of the Cooper Basin. Production to date in the fields has been maintained primarily by infill drilling, with individual wells showing substantial declines in productivity. In 1984 pilot gas injection floods were initiated in both the Tirrawarra and Moorari fields to test the effectiveness of pressure maintenance and the miscible process in the Tirrawarra Sandstone. The results of the pilot injection programs have been most promising: production has improved in most offset producing wells with no sign of early injection gas breakthrough. (Edited author abstract) 4 refs.

**073042 GRIFFITHS MODEL OF TRICRITICAL BEHAVIOR AND ITS APPLICATION, TO THE DESIGN OF ENHANCED OIL RECOVERY PROCESSES.** This paper describes a strategy for the surfactant design based on the relationship between the residual oil saturation and the thermodynamical state of the mixture appearing in the subsurface. More specifically, the suggested approach utilizes the fact that the amount of residual oil is controlled by the thermodynamical distance separating the state of the mixture from a tricritical point. The interfacial tensions between the coexisting phases are derived from a mathematical model combining the van der Waals definition of an interface and the Griffiths thermodynamic model of phase equilibria in the vicinity of a tricritical point. ## Environmental Impact

**073045 WATER POLLUTION FROM OIL AND GAS RECOVERY IN EASTERN KENTUCKY WATERSHEDS.** The effects of water quality on brine discharged from oil and gas recovery operations are described for surface water and ground water in two small watersheds in eastern Kentucky. The brine, which had salinity that was often several times that of sea water, led to significantly higher concentrations of several minerals in surface water, particularly in the first and second order streams. Concentrations as high as 50,000 mg/l for sodium and 64,000 mg/l for chloride were measured in streams. The differences in chemical concentrations for various chemicals over the period of the study were ascribed to temporal variability, particularly due to differences between wet and dry seasons, and to spatial variability, particularly due to dilution and other chemical decay processes. Additional study results are discussed. (Edited author abstract) 23 refs.

## Estimation

**073046 ESTIMATION OF PRODUCTIVITY OF LOBO 6 SAND, LOWER WILCOX, TEXAS, BY IDENTIFYING DIAGENETIC CLAYS WITH WELL LOG DATA.** The laminated, structural, and grain-coating primary clays in the Lower Wilcox Sand, Lobo 6, tend to be potassium-bearing illite and some smectite, whereas diagenetic clays, the cause of pore-throat plugging, are largely potassium-deficient kaolinite and chlorite. These diagenetic clays largely control reservoir permeability, depending on the degree of pore-throat plugging. This paper presents different methods for qualitative and quantitative evaluation of these diagenetic clays, which are related to productivity of the Lobo 6 sand. Qualitative evaluation consists of crossplot techniques using natural spectral gamma ray and other log data plus selected computed reservoir parameters. For quantitative evaluation, a sophisticated clay-analysis program that uses log-derived cation exchange capacity (CEC) and hydrogen index (HI) values is used. (Edited author abstract).

**073050 JOBO STEAMFLOOD PROJECT: EVALUATION OF RESULTS.** This paper presents a description and a preliminary evaluation of the Jobo steamflood project, located in eastern Venezuela, from startup in March 1981 through Dec. 1986. The Jobo project consists of a steamdrive at original reservoir pressure conditions (1,300 psia [8.96 MPa]) because an active aquifer supporting this reservoir prevents pressure depletion by primary steam-stimulated production. The primary recovery estimated for this 8.5° API [1.01-g/cm<sup>3</sup>] accumulation of 10% stock-tank original oil in place (OOIP) is expected to increase to above 45% by steamflooding. To date, 36.2% of the project's stock-tank OOIP has been produced, and steam breakthrough is expected to occur during 1988. (Edited author abstract) 7 refs.

**073052 MINERAL DISSOLUTION, PRECIPITATION, AND ION EXCHANGE IN SURFACTANT FLOODING.** The transient retention of an anionic surfactant below the critical micellar concentration flowing in an argilo-calcareous sandstone is shown to depend

mainly upon: (1) the dissolution of trace amounts of calcium carbonate contained in the sandstone and (2) precipitation and redissolution of the surfactant with calcium ions due to carbonate dissolution or ion exchange on the clays. The adsorption process on solid surfaces is secondary, due to a high pH resulting from the presence of carbonates. A predictive model is developed. It is compared with typical surfactant breakthrough curves and demonstrates that dissolution of calcite is the main process affecting the transport of surfactant close to the injection point. (Author abstract) 33 refs.

Krebs, R. (CNRS, Nancy, Fr); Sardin, M.; Schweich, D. *AIChE J* v 33 n 8 Aug 1987 p 1371-1378.

**073053 BACTERIA CAN PLUG WATERFLOOD INJECTION WELLS.** Laboratory models were constructed to study the injection conditions frequently found in working bore holes, i.e., through perforations full of sand. Our models have incorporated different combinations of loose sand and sandstone to represent the dirty well conditions and formation rock, respectively. This study has attempted to answer the question, "Does the presence of sand in the bore hole influence formation plugging during water flooding?" The bacterium used in our study was isolated from produced waters and injected through the model cores in concentrations similar to those reported in oil well waters. We conclude that stimulation of an injection well would be more efficient if the dirty well was first cleaned up. In the design of a stimulation program to improve injectivity, we suggest that the loose sand be removed before implementing a series of bleach, or bleach acid treatments. This should reduce some of the bacterial plugging and free the perforations for further treatment. 11 refs.

**073054 MISCIBLE DISPLACEMENT OF CRUDE OIL BY CO<sub>2</sub>/SO<sub>2</sub> MIXTURES.** Slim-tube displacement tests on a Pembina Cardium stock-tank oil using CO<sub>2</sub>, SO<sub>2</sub>, and four CO<sub>2</sub>/SO<sub>2</sub> mixtures as the flooding agents demonstrated that the mixtures have lower minimum miscibility pressures (MMP's) than both pure components. More oil was recovered from Berea sandstone cores when CO<sub>2</sub> and a CO<sub>2</sub>/SO<sub>2</sub> mixture were the flooding agents than when SO<sub>2</sub> was used. Carbon dioxide and the CO<sub>2</sub>/SO<sub>2</sub> mixture recovered comparable quantities of oil from Indiana limestone, while a severe loss of permeability was observed in the corresponding SO<sub>2</sub> flood. Rock/fluid interactions characterized by mineral dissolution and precipitation were observed with all flooding agents in both rock types. (Edited author abstract) 19 refs.

**073057 DESCRIPTION OF AN IMPROVED COMPOSITIONAL MICELLAR/POLYMER SIMULATOR.** A description is given of a micellar/polymer or chemical flood simulator and compare it to experimental data. A three-dimensional version of this simulator has been developed, but in this paper we describe only the one-dimensional (1D) flow equations because we focus on comparisons with linear coreflood data and related physical properties. All physical property models are the same in both versions, however. The property models described in this paper are (1) inaccessible PV, (2) permeability reduction, (3) polymer-phase viscosity, (4) adsorption, (5) residual phase saturations as a function of capillary number, and (6) relative permeabilities. (Edited author abstract) 20 refs.

Camilleri, D. (Univ of Texas, TX, USA); Engelsen, S.; Lake, L.W.; Lin, E.C.; Ohno, T.; Pope, G.; Sepehrmoori, K. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 13967, p 427-432.

**073058 IMPROVEMENTS IN PHYSICAL-PROPERTY MODELS USED IN MICELLAR/POLYMER FLOODING.** Various physical-property models required by chemical flood simulators have been improved and others developed. The most significant development in the use of pseudophases to model phase behavior. The method allows representation of four pseudocomponents. This is made possible by assuming that alcohol is distributed among the other three pseudocomponents, thus forming three pseudophases that are assumed to be in thermodynamic equilibrium. Another improvement relates to the ion-exchange model. Cations are considered to exchange with both surfactant micelles and clays. The model assumes the exchange to be entirely a result of electrostatic association. A model for treating physical dispersion coefficients as a function of saturations has been added. The model is based on experimental evidence and is purely empirical. (Edited author abstract) 25 refs.

Camilleri, D. (Univ of Texas, TX, USA); Fil, A.; Pope, G.A.; Rouse, B.A.; Sepehrmoori, K. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 12723, p 433-440.

**073059 COMPARISON OF AN IMPROVED COMPOSITIONAL MICELLAR/POLYMER SIMULATOR WITH LABORATORY COREFLOODS.** The authors compare numerical simulations made with our previously reported simulator with both our own and literature experiments. The most significant improvement concerns the phase behavior model used in the simulator. The new model approximately represents the phase behavior of pseudoquaternary mixtures containing surfactant, cosurfactant, oil, and brine. The different effects of sodium and calcium cations in the mixtures are accounted for with a new cation exchange model allowing for exchange with both clays and micelles. A tertiary oilflood experiment is reported that includes a more complete analysis of phase compositions and properties than generally available previously. Produced samples were analyzed for surfactant, alcohol, sodium, calcium, polymer, tritium, water, carbon-14-tagged decane, and decane. (Edited author abstract) 27 refs.

**073060 METHOD FOR LABORATORY AND FIELD EVALUATION OF A PROPOSED POLYMER FLOOD.** The relevant components of a proposed polymer flood in the Tensleep reservoir of the Frannie Phosphoria-Tensleep Unit in Park County, WY, were investigated. Laboratory testing consisted of polymer injectivity, stability, retention, and effective viscosity measurements. On the basis of polymer viscosity and retention tests, a polysaccharide polymer was chosen over a polyacrylamide polymer for extensive laboratory evalua-

tion and field pilot tests. Field testing included injectivity, biological stability, and in-situ viscosity measurements. Pressure falloff tests following variable-rate injection of a polysaccharide polymer solution indicated the presence of a non-Newtonian, low-mobility bank. (Edited author abstract) 1 ref.

**073061 EFFECT OF OIL COMPOSITION ON MINIMUM MISCIBILITY PRESSURE - PART 1: SOLUBILITY OF HYDROCARBONS IN DENSE CO<sub>2</sub>.** This paper examines the effect of oil composition on the phase behavior of CO<sub>2</sub>/hydrocarbon mixtures and, hence, on the development of miscibility in a CO<sub>2</sub> flood. Results of component-partitioning measurements are reported for mixtures of CO<sub>2</sub> with five synthetic oil systems: normal alkanes, branched alkanes, naphthenes, aromatics, and a mixture of all four molecular types. The results of the experiments indicate that unsubstituted ring structures are less soluble in dense CO<sub>2</sub> than branched or normal alkanes with the same number of carbon atoms, but that the addition of alkyl side chains to ring structures improves their solubility. Also reported are component-partitioning measurements for mixtures of CO<sub>2</sub> with three crude oils: Rock Creek (paraffinic), Maljamar (more aromatic), and Rock Creek plus 15 wt% of a mixture of aromatic components. (Edited author abstract) 33 refs.

Silva, M.K. (New Mexico Petroleum Recovery Research Cent, NM, USA); Orr, F.M. Jr. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 14149, p 468-478.

**073062 EFFECT OF OIL COMPOSITION ON MINIMUM MISCIBILITY PRESSURE - PART 2: CORRELATION.** A new correlation for CO<sub>2</sub> minimum miscibility pressure (MMP) is proposed and tested. The correlation is based on experimental evidence that extraction of hydrocarbons from a crude oil depends most strongly on the size of the hydrocarbon molecules. Thus, an oil rich in hydrocarbons that are efficiently extracted should show a lower MMP than a heavier oil. The only crude-oil data needed for use of the correlation are a carbon-number distribution, which can be obtained easily by chromatography. The density of CO<sub>2</sub> at the MMP is correlated against a weighted-composition parameter. The proposed correlation produces MMP estimates accurate to within about 10% for most oils. (Edited author abstract) 37 refs.

**073063 INTERPRETATION OF MISCIBLE DISPLACEMENTS IN LABORATORY CORES.** Results of stable, first-contact miscible displacements are presented for three San Andres carbonate cores from west Texas and eastern New Mexico. All three cores showed evidence of significant heterogeneity at the core scale. Effluent composition measurements were interpreted with two relatively simple models of mixing during flow in heterogeneous porous media: the Coats-Smith (CS) model, which represents the pore space as flowing and stagnant fractions with mass transfer between them, and a porous sphere (PS) model, which describes flow between an assemblage of porous spheres with diffusive interchange of material in the spheres with fluid flowing past them. Parameters for the two models are reported and compared. (Edited author abstract) 24 refs.

**073066 APPLICATION OF GRADIENT THEORY OF INHOMOGENEOUS FLUID TO PREDICTION OF LOW INTERFACIAL TENSIONS IN CO<sub>2</sub>/HYDROCARBON SYSTEMS.** M. Sahimi, H.T. Davis, and L.E. Scriven recently presented predictions of interfacial tensions (IFT's) for CO<sub>2</sub>/hydrocarbon systems using the gradient theory of inhomogeneous fluid (GTIF) model. In the present paper, additional calculations from the GTIF model are presented at low IFT's, and comparisons are made with experimental measurements. The results show that the GTIF model predicts 'classical' scaling behavior at low IFT's, in conflict with experimental observations. Thus, while the GTIF model has been documented by its authors to yield good predictions at high and moderate levels of IFT, it could be inappropriate for use at the low levels of IFT ( $\sigma < 0.1$  mN/m [0.1 dynes/cm]) that may be required to enhance the oil displacement efficiencies in enhanced gas drives. (Author abstract) 28 refs.

**073067 PREDICTION OF CO<sub>2</sub> FLOOD PERFORMANCE: INTERACTION OF PHASE BEHAVIOR WITH MICROSCOPIC PORE STRUCTURE HETEROGENEITY.** This paper describes simulations of the effects of microscopic heterogeneity present in rock pore structures or resulting from high water saturations on the performance of one-dimensional (1D) CO<sub>2</sub> floods. In the simulations, microscopic heterogeneity was represented by dividing the nonaqueous portion of the pore space into flowing, dendritic, and trapped fractions. A 1D simulator, previously shown to model quantitatively the effects of phase behavior in slim-tube displacements, was modified to include effects of the isolated or trapped fraction unavailable for mixing with injected fluids and the dendritic fraction, which exchanges material with the flowing fraction by mass transfer. Model formulation, numerical solution, and validation tests are described. (Edited author abstract) 27 refs.

**073068 DISPLACEMENT OF VISCOUS OIL FROM CONSOLIDATED CORES BY CAUSTIC AT TEMPERATURES ABOVE 257°F.** Laboratory data were obtained to investigate the use of alkaline material with or without a small amount of surfactant as an additive to steam to enhance oil recovery from that portion of a reservoir subjected to a hot waterflood in a conventional steamflood. A series of hot alkaline floods (some containing surfactant) was performed on fired cores previously subjected to a hot waterflood in an isothermal flooding apparatus with temperatures as high as 356°F [180°C]. Floods with no previous waterflood were also

tested. Results show that tertiary recovery increases with increasing temperature, increasing flood rate, increasing salt concentration in the injected caustic, and the addition of surfactant. (Edited author abstract) 18 refs.

**073069 SURFACTANT FLOODING WITH HARD WATER: A CASE STUDY SOLVED BY HLB GRADIENT.** Surfactant formulations were designed for field application of micellar processes in a salty environment on the basis of a mixture of one synthetic sulfonate with two types of nonionic agents. This formulation led to the required Winsor-III-type phase diagram in the presence of reservoir fluids at reservoir temperature. The main difficulty in this study was the high level of surfactant retention in the reservoir rock. The sacrificial agents tested did not reduce these surfactant losses significantly. The solution found to be efficient consisted of creating a hydrophilic-lipophile balance (HLB) gradient of the additives used in situ by injecting a desorbing agent with high HLB behind the micellar slug containing the nonionic cosurfactants with lower HLB. (Edited author abstract) 19 refs.

Minssieux, Louis (Inst Francais du Petrole, Fr). *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 14292, p 605-612.

**073070 SURFACTANT FLOODING CARBONATE RESERVOIRS.** This paper presents data obtained in two well-pair surfactant floods undertaken in the San Andres formation, Bob Slaughter Block, Hockley County, Texas. The data provided by these tests demonstrate (1) low-permeability carbonate reservoirs can be chemically flooded, (2) polymer can be injected and propagated in these reservoirs without any biodegradation, (3) these systems can mobilize tertiary oil effectively at a chemical consumption near that observed in the laboratory, and (4) two-well tests can provide a quick field evaluation of surfactant systems proposed for large-scale use. (Edited author abstract)

**073071 GRAVITY EFFECTS IN THE DISPLACEMENT OF OIL BY SURFACTANT SOLUTIONS.** The displacement of isooctane by aqueous surfactant solutions was investigated in model porous media consisting of a thin layer of lightly sintered glass beads. Pre-equilibrated oil/surfactant pairs were prepared that exhibited interfacial tensions (IFT's) in the range 0.06 to 2.08 mN/m [0.06 to 2.08 dynes/cm]. Because aqueous solution viscosity was always higher than that of the isooctane, a stable displacement would normally be expected. While systems with IFT's greater than about 1 mN/m [1 dyne/cm] showed sharp interfaces and generally stable displacements, experiments conducted at lower IFT exhibited a considerable degree of instability. In particular, at lower tensions, the interfaces became fuzzy, and there was distinct evidence of gravity override by the aqueous phase. (Edited author abstract) 13 refs.

Hornof, V. (Univ of Ottawa, Ont, Can); Morrow, N.R. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 13573, p 627-633.

**073072 IN-SITU GEL CALCULATIONS IN COMPLEX RESERVOIR SYSTEMS USING A NEW CHEMICAL FLOOD SIMULATOR.** This paper presents results for a series of calculations on the deep emplacement of a polymer gel in a stratified reservoir model. These calculations were performed with a new chemical flooding simulator that has the facility to describe generalized chemical reactions between components. This code is described, and preliminary calculations on an in-situ gel treatment in a large model reservoir are presented. We find that to obtain significant amounts of incremental oil while avoiding very large pressure buildup, the polymer gel system must have the correct combination of long gelation times and good permeability-reducing

properties in the high-permeability streak (residual resistance factor  $F_R$  approx. 10 to 40 in the cases studied here). (Edited author abstract) 23 refs.

**073074 STUDY OF MINERAL/ALKALI REACTIONS.** A study of the reaction of alkaline chemicals with minerals constituting reservoir rock is presented. Static tests were conducted with high concentrations of NaOH and orthosilicate solutions and minerals (montmorillonite, kaolinite, illite, and quartz sand). The reaction time varied from 10 minutes to 2 months. Solutions were analyzed for hydroxide, Si, and Al, and solids were analyzed by X-ray diffraction (XRD) and other spectroscopic techniques. The loss of useful alkalinity was the highest with kaolinite and the least with quartz sand for high alkali concentration (5 wt%) or temperature (180°F [82°C]). A detailed study of kaolinite/alkali reaction kinetics and quartz/alkali equilibrium is presented. (Author abstract) 54 refs.

**073075 VISCOSITY AND PHASE BEHAVIOR OF PETROLEUM SULFONATE SOLUTIONS IN THE LIQUID CRYSTALLINE REGION.** Aqueous solutions of two petroleum sulfonate surfactants, a pure sulfonate surfactant and one mixed with an ethoxylated sulfate surfactant, were studied with polarizing microscopy, polarized light screening (PLS), and viscometry. The same sequence of phases was seen with increasing salinity for the various surfactants - i.e., transformation from an isotropic micellar solution to a lamellar liquid crystalline phase to an isotropic phase that scattered light and exhibited streaming birefringence. Addition of calcium ions to the petroleum-sulfonate/ethoxylated-sulfate mixtures led to the same basic sequence of transformations, but the effect of calcium was about 11.5 times as great as that of sodium on a molar basis. It was found that apparent viscosity decreased with increasing shear rates and was time-dependent at a given shear rate. (Edited author abstract) 32 refs.

**073076 CYCLING WITH AIR AND OTHER NON-HYDROCARBON GASES.** Injecting lean gas into condensate reservoirs is a practice currently used to increase recovery. The process reduces condensation and increases liquid recovery by revaporization. However, delaying natural gas sales for long periods of time is economically unattractive. The purpose of this paper is to investigate the effectiveness of nonhydrocarbon gases (i.e., air, N<sub>2</sub>, and CO<sub>2</sub>) for improving recovery from retrograde condensate reservoirs. A compositional model that uses the Peng-Robinson equation of state (PR-EOS) was developed to evaluate condensate reservoir performance. A

15-component hydrocarbon system and extensive experimental data were used in the study. The model shows that nonhydrocarbon gases can vaporize hydrocarbon liquids effectively, with CO<sub>2</sub> the most effective nonhydrocarbon for vaporizing heavy fractions. (Edited author abstract) 11 refs.

**073077 FOUR-PHASE FLASH EQUILIBRIUM CALCULATIONS USING THE PENG-ROBINSON EQUATION OF STATE AND A MIXING RULE FOR ASYMMETRIC SYSTEMS.** A technique for predicting one- to four-phase flash equilibrium is presented for multicomponent systems containing water, such as CO<sub>2</sub>/crude-oil/H<sub>2</sub>O mixtures that characterize the CO<sub>2</sub> miscible flooding of petroleum reservoirs. The Peng-Robinson equation of state (PR-EOS) is used to describe the aqueous and hydrocarbon phases, and an accelerated and stabilized successive-substitution method is used to obtain convergence, even in the near-critical region. In order to describe accurately multiphase equilibria involving water, a recently developed mixing rule for asymmetric systems is incorporated that permits the solubilities of both CO<sub>2</sub> in H<sub>2</sub>O and H<sub>2</sub>O in CO<sub>2</sub> to be modeled. The equation of state (EOS) is also modified to enable the aqueous-phase density to be predicted accurately. (Edited author abstract) 33 refs.

**073078 COMPUTER IMAGE PROCESSING: A NEW TOOL FOR STUDYING VISCOUS FINGERING IN COREFLOODS.** Computer image processing technology was used to study the patterns of viscous fingering in laboratory corefloods. The fingering patterns in unstable immiscible corefloods were captured and photographed with the aid of a fluorescent dye. The photographs were digitized and stored as computer image files for subsequent processing. A program was written to count the fingers, to determine their sizes, to compute the sweep efficiencies at the core cross sections, and to determine the frequency contents of the fingering patterns. Results show that computer image processing technology can be used to study the performance of laboratory corefloods quantitatively. (Edited author abstract) 31 refs.

**073081 WETTABILITY LITERATURE SURVEY - PART 6: THE EFFECTS OF WETTABILITY ON WATERFLOODING.** This paper examines the effects of wettability on waterflooding, including the effects on the breakthrough and residual oil saturations (ROS's) and the changes in waterflood behavior caused by core cleaning. Also covered are waterfloods in heterogeneously wetted systems. Waterfloods in fractionally wetted sandpicks, where the size of the individual water-wet and oil-wet surfaces are on the order of a single pore, behave like waterfloods in uniformly wetted systems. In a mixed-wettability system, the continuous oil-wet paths in the larger pores alter the relative permeability curves and allow the system to be waterflooded to a very low ROS after the injection of many PV's of water. (Edited author abstract) 122 refs.

**073082 DISPLACEMENT OF OIL BY WATER FROM THE PART OF AN OIL-AND-GAS DEPOSIT UNDERLYING THE GAS.** If at the start of the working of an oil-and-gas deposit the gas-saturated part of the formation is characterized by the absence of or very slight presence of an initial oil saturation, then the direction of displacement of oil and gas by water from the zone underlying the gas is of great importance. A relatively high oil output is observed when the oil is displaced in the direction from the inner to the outer contour of the gas-saturated zone. When there is an initial oil saturation equal to or exceeding the residual oil saturation in the gas-saturated part of the formation, then the displacement direction has no effect on the efficiency of the process, i.e., if the oil is displaced from the inner to the outer contour or from the outer to the inner contour of the gas-saturated zone the final oil output is practically the same. In Russian. 6 refs.

Kurbanov, A.K.; Udmov, R.Kh. *Neft Khoz* n 8 Aug 1987 p 29-32.

**073083 EFFECT OF INSTABILITY ON RELATIVE PERMEABILITY CURVES OBTAINED BY THE DYNAMIC-DISPLACEMENT METHOD.** A study was undertaken to investigate how instability would affect the oil/water relative permeability curves obtained by the dynamic-displacement method. In this method, stable Buckley-Leverett displacement theory is used to calculate relative permeability curves from coreflood data. Thus, to obtain the true relative permeability curves by the dynamic-displacement method, the coreflood must be stable. However, the method frequently has been applied to unstable corefloods. The consequence of this application of the method has not been previously reported. We compared oil/water relative permeability curves from steady-state and dynamic-displacement experiments at several levels of instability. The results showed that the dynamic-displacement relative permeability curves deviated significantly from the steady-state curves as the degree of instability increased. (Edited author abstract) 18 refs.

**073085 WORKING OF POROUS-TYPE CARBONACEOUS COLLECTORS.** The efficiency of oil extraction from carbonaceous collectors is lower than that from terrigenous collectors. Thus the maximum oil extraction coefficient for the best carbonaceous collectors in the regions studied does not exceed 0.53, while the maximum coefficient for terrigenous collectors amounts to 0.7. Measures for improving the efficiency of working carbonaceous collectors include intensification of the flooding system, increasing the injection pressure, and the use of unsteady flooding methods. The flooding systems and the mutual arrangement of extraction and injection wells in carbonaceous collectors must be established with allowance for the possible occurrence of cracking. In Russian. 5 refs.

Sazonov, B.F.; Koralev, V.S.; Shabanov, V.A.; Gudoshnikov, S.S.; Zhitomirskii, V.M.; Lyubarskaya, N.B.; Shaunova, L.K.; Sopronyuk, N.B.; Pilov, A.A.; Safonov, A.V.; Morgunov, A.P. *Neft Khoz* n 9 Sep 1987 p 25-30.

**073086 WORKING THE DEPOSITS OF THE KRASNOYARSK AND BOBROSSK FIELDS.** The special features of the working of deposits with carbonaceous collectors are related mainly to the pronounced inhomogeneity of their structure and to the presence of a network of cracks and cavities. Under the conditions of this inhomogeneity of the structure of carbonaceous collectors the nature of their working is greatly affected by the flooding system chosen. The most favorable conditions for the displacement of oil by water are created upon the introduction of marginal, focal and block systems or combinations of them. In Russian.

**073088 INTERFACIAL SPREADING AGENTS INCREASE WATERFLOOD PRODUCTION.** Use of a novel class of interfacially active compounds when properly selected for a specific oil-water-rock system are effective in mobilizing additional commercial oil after waterflooding. The success of thin film spreading agent (TFSA) applications in cyclic steaming combined with positive laboratory results pointed to the potential benefit of these products in ordinary waterfloods. The effectiveness of these compounds appears to arise from their ability to displace thick films which form at interfaces between crude oils and the higher energy reservoir rock and water phases, thereby replacing them with very thin, mobile films which offer little resistance to coalescence and water-wetting of rock. This article reports the results of the first field application of these new interfacial spreading agents in a previously waterflooded reservoir. 8 refs.

**073089 NUMERICAL MODELING OF THE DISPLACEMENT OF OIL BY SLUGS OF A SOLVENT FROM POROUS MEDIA WITH AN INCLUSION.** Numerical modeling of two-dimensional flow of oil, water, and solvent encounters great difficulties, since numerical diffusion, which is inherent in the difference schemes of shock-capturing (through-computation) normally used in the solution of problems on flow in a porous medium, seriously distorts the nature of the motion of the slug. The main purpose of this study was to investigate the principal properties of the two-dimensional motion of liquids with very different mobilities, a number of simplifying assumptions were introduced into the model describing the process of displacement of oil by slugs of a solvent. The flow was assumed to be two-phase and three-component. The capillary, gravitational, and diffusion effects, and also the compressibility of the liquids, were not taken into account. The content of the solvent in the liquid forcing it through (water) was neglected in comparison with the content in the oil phase. 14 refs.

**073091 EFFECT OF CAPILLARY PRESSURE ON THE APPROACH TO RESIDUAL SATURATION.** The approach to residual oil saturation during the immiscible displacement of oil as predicted by the multiphase Darcy equations is studied. It is well-known that when the capillary pressure term is neglected, one arrives at the Buckley-Leverett formulation according to which the inlet face attains residual oil saturation instantaneously. This result may, however, be strongly influenced by the inclusion of the capillary pressure term. In this paper it is shown that when the relative permeability and capillary pressure functions have power-law dependencies on the saturation deviation from residual oil condition, the long-time solution exhibits a power-law decay toward residual saturation. Moreover, the power-law decay solution is found to be unique and independent of the initial conditions. The relationship of this solution is found to be unique and independent of the initial condition. The relationship of this solution to the classical Buckley-Leverett result is shown. Finally, generalization to the time-varying flow rate case is addressed. (Edited author abstract)

**073092 EQUATION-OF-STATE STEAM SIMULATOR.** A one-dimensional fully implicit compositional simulator has been developed for the hot water and steam injection processes. This simulator is the first steam simulator reported to date which uses the equation-of-state approach to phase behavior. Because of the equation-of-state phase behavior approach used, numerous displacement mechanism studies become possible. Examples of single hydrocarbon component runs are presented to investigate the various important features peculiar to the steamflood process. A two hydrocarbon distillable component run is presented as an example of the separation of components in the oil. (Author abstract) 12 refs.

n 1 Mar 1987 p 1-37.

**073093 EFFECTS OF SHEAR HISTORY ON THE GELATION OF POLYACRYLAMIDE-CHROMIUM(VI)-THIOUREA SOLUTIONS.** The influence of shearing on the gelation rate of a polyacrylamide-chromium(VI)-thiourea solution was studied in depth. Gelations were carried out under steady-state shear, oscillatory shear, and programmed shear. For the solution studied, gels formed more slowly at higher constant shear rates than at lower shear rates. This behavior is opposite to that observed with polyacrylamide-chromium(VI)-bisulfite solutions, where increased shear rates led to faster gelations. Since the rate of gelation and strength of the gel formed are strongly influenced by the total shear history, the evaluation of gel characteristics in quiescent bottle tests, as is commonly done, may not be sufficient to determine whether a gel of the desired strength can be obtained in situ. **073094 INCREASING THE FLOODING COVERAGE OF A FORMATION.** Under the conditions of a high degree of layer-to-layer inhomogeneity of the productive formations of the Udmurtiya oil fields it is advisable to carry out interval-by-interval acid treatments even in the early stage of exploitation of the wells, and the formations should be worked initially from the low-permeability interlayers. In order to improve the flooding coverage of a formation, the high-permeability sections should be shielded from the action of the acid and leakages of the acid solution into the annular space must be prevented. For this purpose, it is recommended that after the second acid treatment directional acid treatments be carried out interval by interval with prior blocking of the zones of discharge of acid into high-permeability interlayers. 4 refs. In Russian.

**073095 CONTROLLING THE PERMEABILITY OF THE WATER-CONDUCTING CHANNELS OF A FORMATION WITH AN AMMONIA SOLUTION.** By reacting a 24% aqueous solution of ammonia with the injected wastewater, it is possible to obtain a complex precipitate consisting of calcium and magnesium hydroxides and also ammonium sulfide. The precipitate formed is easily dissolved in hydrochloric acid, which is important for restoring the permeability of the formation during complete clogging of the water-conducting channels. The introduction of an ammonia solution into the wastewater leads to a decrease in the concentration of hydrogen sulfide, which is an aggressive corrosion component. 3 refs. In Russian.

**073096 RATE DEPENDENCE OF UNSTABLE WATERFLOODS.** Viscous fingering is part of the flow mechanisms that are operative in waterflooding and in a wide range of EOR methods. A laboratory and computer model analysis is conducted of the viscous-fingering dynamics that develop when a less mobile fluid is immiscibly displaced by a more mobile fluid in a permeable medium. Physical experiments of horizontal fluid displacements conducted in a rectangular bead pack show that the amplitude/frequency character of the wave-like fingers that form depends on flow rate and mobility ratio. The nature of these wave-like features is shown for two viscosity ratios and several displacement rates. Spatial frequency domain analyses of finger shapes at fixed time intervals were conducted on digitized records of the laboratory experiments. (Edited author abstract) 21 refs.

**073097 CO<sub>2</sub> DISPLACEMENTS OF RESERVOIR**

**OILS FROM LONG BEREAS CORES: LABORATORY AND SIMULATION RESULTS.** CO<sub>2</sub> displacements of three different reservoir oils from long Berea cores were conducted over a wide range of reservoir conditions with the pressure always above the slim-tube minimum miscibility pressure (MMP). The detailed performance of these displacements is simulated with a fully compositional simulator and the Redlich-Kwong (RK) equation of state (EOS). Oil recovery, GOR, and effluent profiles are compared with experimental results. The EOS is observed to be capable of predicting the phase-behavior transitions that occur in situ when miscibility is generated by multiple contacts. The good comparison between experimental results and the simulation has led to specification of a minimum data set for which an EOS should be able to predict before a priori simulations of displacement experiments can be made. (Edited author abstract) 24 refs.

**073098 PHASE BEHAVIOR OF SEVERAL CO<sub>2</sub>/WEST-TEXAS-RESERVOIR-OIL SYSTEMS.** The design of miscible CO<sub>2</sub> recovery methods and the evaluation of laboratory CO<sub>2</sub> coreflood and pilot field studies require knowledge of the phase behavior encountered in such processes and the ability to make reliable predictions. Because of the complexity of CO<sub>2</sub>/hydrocarbon phase behavior, experimental measurements are necessary as a basis from which to develop an understanding. Measured phase equilibria and volumetric properties are reported for several west-Texas-reservoir-oil/CO<sub>2</sub> systems. Both static (single-contact) and multiple-contact measurements have been conducted in a visual fluid property cell. Static data cover a wide range of CO<sub>2</sub> compositions and provide a general understanding of CO<sub>2</sub>/reservoir-oil phase behavior. (Edited author abstract) 9 refs.

**073099 MECHANISTIC STUDY OF GRAVITY-ASSISTED CO<sub>2</sub> FLOODING.** A series of gravity-assisted vertical core displacements of contact-miscible and multiple-contact-miscible CO<sub>2</sub>/recombined-crude-oil systems was conducted and simulated. Gravity-assisted displacements offer the advantages of eliminating gravity tongues and stabilizing viscous fingers. Although the process has been used successfully in the field, a mechanistic laboratory and modeling study of gravity-assisted multiple-contact-miscible CO<sub>2</sub> flooding has not been described previously. The results from this experimental and computer modeling study elucidate the complex mechanisms acting in gravity-assisted CO<sub>2</sub> flooding. Component transfer, as occurs in multiple-contact-miscible processes, can strongly affect flood-front stability. (Edited author abstract) 31 refs.

**073100 EFFECT OF AN AQUEOUS PHASE ON CO<sub>2</sub>/TETRADECANE AND CO<sub>2</sub>/MALJAMAR-CRUDE OIL SYSTEMS.** The effect of the presence of an aqueous phase on the phase behavior of the CO<sub>2</sub>/tetradecane and the CO<sub>2</sub>/Maljamar-crude-oil systems has been experimentally determined. Both the salinity and the amount of the aqueous phase were varied to test several methods of modeling. In the first technique, the amount of CO<sub>2</sub> 'lost' to the aqueous phase was determined using Henry's law, decreasing the overall ratio of CO<sub>2</sub> to hydrocarbons, while the Peng-Robinson equation of state (PR EOS) was used to determine the phase distribution of the hydrocarbon phases. In the second technique, the equation of state (EOS) was modified to predict the

densities and compositions of not only the hydrocarbon phases, but also the aqueous phase. (Edited author abstract) 26 refs.

**073102 APPROXIMATE MODEL WITH PHYSICALLY INTERPRETABLE PARAMETERS FOR REPRESENTING MISCIBLE VISCOUS FINGERING.** An approximate viscous fingering model is derived with physically related parameters. Plausible assumptions are made about some limits on finger fluid mixing, and the use of a fingering function is suggested. It is shown that for the horizontal linear problem, a hyperbolic partial-differential equation governs the solvent fractional flow behavior. Satisfactory agreement with classic miscible displacement experiments is demonstrated for a reasonable choice of parameters. When gravity is introduced into the equation, the same model gives adequate agreement with the rate dependency observed in a vertical displacement experiment. Recommendations are made concerning extension of the model for use in three-dimensional (3D) compositional simulations. (Author abstract) 9 refs.

**073106 MULTIPLE-CONTACT PHASE BEHAVIOR MEASUREMENT AND APPLICATION WITH MIXTURES OF CO<sub>2</sub> AND HIGHLY ASPHALTIC CRUDE.** The phase behavior relevant to CO<sub>2</sub> flooding for multiple-contact miscible, immiscible, or huff 'n' puff applications is studied. Unique features of this investigation are that the live reservoir oil was highly asphaltic and was modified to resemble the composition likely contacted by injected CO<sub>2</sub>. Single-contact and two types of multiple-contact PVT data are presented, and the usefulness of such data in predicting CO<sub>2</sub> flood performance is discussed. Results show no liquid/liquid/vapor (L/L/V) three-phase region at higher temperatures and no liquid/liquid (L/L) critical point. Large CO<sub>2</sub> concentrations were required before substantial hydrocarbon extraction occurred. A ternary diagram representation of forward multiple-contact compositional results indicates that CO<sub>2</sub> generated miscibility with the oil by the vaporization mechanism. (Edited author abstract) 20 refs.

**073107 OILFIELD MICROORGANISMS AND THEIR ROLE IN DESTRUCTION OF NONIONIC SAS.** The goal of the present investigation was to study microorganisms in stratal waters decomposing nonionic SAS, to isolate them, and to study the possibility of their use for treatment of waste waters. The subjects of the investigation were the strata of the Tuimazy and Arlan oilfields, where in 1967 a 0.05% solution of OP-10 detergent was injected to increase oil output, and where experiments are being carried out to evaluate the degradability of nonionic SAS under the effect of stratal microorganisms. It was shown that the isolated microorganisms exert destructive activity for ethoxylated alcohols, acids, and alkylphenols. Experimental data were obtained demonstrating the possibility of use of these microorganisms to treat waste waters containing nonionic SAS. 10 refs.

**073108 MOBILITY CONTROL OF CAUSTIC FLOOD.** Displacement tests to date of oil field core with alkaline solutions at reservoir temperature show low tertiary oil recovery. Inadequate mobility control is singled out as the reasons for such poor recovery. To test the validity of this reasoning, a laboratory study was undertaken in which a high heat resistant power was used as the mobility control agent in a hot alkaline solution recover technique. It is observed that polymer injection actually did improve recovery substantially and that there is an optimum concentration and slug size of polymer for a particular reservoir. Higher concentrations of pore volumes injected did not improve recovery significantly. (Edited author abstract) 25 refs.

**073109 EVALUATION OF AN ANALYTIC TECHNIQUE FOR ESTIMATING SWEEP VOLUME FROM THERMAL PRESSURE FALLOFF TESTS IN HETEROGENEOUS SYSTEMS.** Several simulated pressure falloff tests were analyzed to see whether the swept volume estimated by an analytic technique agrees with the swept volume simulated with both a steamflood

model and an in-situ combustion model. Several parameters, such as wellbore gridblock size, nonuniform permeability, layering, flowing noncondensable gas, and oil vaporization, were studied. The analyses of these runs also led to the evaluation of other parameters, such as permeability-thickness, kh, in the swept zone. For steamfloods, the analytically estimated swept volume in relatively homogeneous models is in agreement with the simulated swept volume. The calculated kh reflects the effective gas permeability-thickness at the average gas saturation behind the steam front. (Edited author abstract) 12 Refs.

**073110 ANALYSIS OF UNSTEADY-STATE DISPLACEMENT USING A CAPACITANCE-DISPERSION MODEL.** Tracer displacements were performed during both steady state and unsteady state oil and water flow. Chemical and radioactive tracers, partitioning and non-partitioning, were added to both the wetting and non-wetting phases. These experiments were conducted in naturally water-wet and treated neutrally-wet Berea sandstone cores to also investigate the effect of wettability. The mobility ratio was varied from a favorable to an unfavorable one during the unsteady-state waterflood experiment. An existing capacitance-dispersion model, a Coats-Smith type model, was used to fit the effluent tracer profiles from the steady-state experiments. The model is developed to predict the behavior of tracer data during unsteady-state waterflood experiments. This model divides each phase into two parts, flowing and dendritic. Wettability alteration has an effect on the capacitance parameters. (Edited author abstract) 30 Refs.

**073111 DETERMINATION OF THREE-PHASE RELATIVE PERMEABILITIES UNDER RESERVOIR CONDITIONS BY HOT WATER AND STEAMFLOOD EXPERIMENTS.** In order to help the physical and numerical interpretation of Emeraude's steam pilot, two-phase waterfloods at four temperatures (between 30 and 240°C) and a steamflood were performed in the laboratory using the same porous medium (compacted silt) and under reservoir conditions. Dynamic isothermal displacements were interpreted with a thermal simulator taking into account capillary end effects. The corresponding oil-water relative permeability curves were obtained by matching observed pressure drop and oil production. Results show that temperature influences the end-point saturations but not the shape of the curves. The numerical interpretation of this experiment, by making use of the oil-water relative permeabilities, provided the three-phase oil relative permeability which is an essential datum for numerical interpretation of a steam drive pilot. (Edited author abstract) 7 refs.

**073116 ANALYSIS OF RESERVOIR CHEMICAL TREATMENTS.** In chemical well treatments, success or failure is often difficult or impossible to anticipate. The near-wellbore pressure drawdown and fines migration contribute to the overall well damage, but the effect of the chemical treatment alone can induce damage by reprecipitation when the spent treatment solution is produced over the treated zone. The identity, amount, and rate of return of this reprecipitation damage are discussed. Our procedure considers the chemical interaction of formation minerals and brine with the treatment solution in the presence of an immiscible phase. Although this analysis contains several simplifying assumptions, the results can be applied, with care, to lend insight and direction to practical problems. (Edited author abstract) 39 refs.

**073117 REVISED BEAN PERFORMANCE EQUATION FOR EAST BAGHDAD OIL WELLS.** A comparison of the existing correlations for the determination of multiphase fluid-flow performance through a wellhead choke is made. The comparison is based on statistical analysis with production data from 155 well tests, 20 of which are from the East Baghdad oil field. The comparison indicates the relative strengths and weaknesses of each correlation and should aid in the selection of a satisfactory correlation for different applications. No one method is found to be most accurate in all ranges of flow variables. The best overall comparison, however, is obtained with the Gilbert correlation that predicted measured production rates within an average error of 6.1%. This correlation is then revised in two forms to fit the observed data from the East Baghdad oil wells best. (Author abstract) 8 refs.

**073118 CORRELATION DEVELOPED TO PREDICT TWO-PHASE FLOW THROUGH WELL-**

**HEAD CHOKES.** The predictive accuracy of eight critical two-phase flow correlations are tested against field measured production data, from 210 well tests, covering broad ranges of production rates, choke sizes, upstream pressures, gas-liquid ratios and oil API gravities. Test data are divided into four selected categories based on choke size (D). The average percent error, absolute average percent error, and standard deviation are computed for each correlation. Due to inconsistency of results obtained by the included correlations, the multiple regression analysis is used to find out correlations that best fit the measured data, as a result, four new correlations are developed (a correlation for each data category). Based on the statistical results, the new correlations clearly outperformed the remaining correlations. (Edited author abstract) 8 refs.

**Gas Lift** See Also OIL FIELDS—North Sea.

**073121 OPTIMAL LIQUID FLOW RATE IN GAS-LIFT WELLS.** An increase in the liquid viscosity and the surface tension at the liquid-gas boundary and a decrease in the gas density reduce the liquid flow rate for specific pressure differentials less than 0.4. Consequently, effective action on the gas-liquid flow for the purpose of increasing the efficiency of a gas-lift hoist is possible only in the above-mentioned pressure range. The optimal liquid flow rate reaches a maximum value at specific pressure differentials of 0.7-0.8. The maximum efficiency of a gas-lift hoist may be obtained at specific pressure differentials of 0.6-0.8 and at a reduced gas density no less than 0.02. In Russian. 2 refs.

Belogortzev, G.P.; Vasil'ev, V.A.; Guzhov, A.I. *Neft Khoz* n 5 Mar 1987 p 29-31.

**073122 DRAWBACKS OF GASLIFT CAN BE OVERCOME.** The importance of continuous-flow gaslift continues to increase with the number of oil fields, particularly offshore, where deviated wells and sea-bottom completion make application of other lifting methods unattractive or impossible. Although many advances have been made over the years in the design of gaslift strings and valves, there remain a few drawbacks that reduce the attractiveness of the method. The most important of these are the occurrence of heading problems, the expense of wireline/through flow line (TFL) operations, and the cost of well repairs associated with malfunctioning gaslift equipment. These problems, can largely be solved by applying alternative strategies for regulating liftgas injection rates. In offshore fields, it is necessary to eliminate gaslift valves and start the gaslift process with a start compressor. On multiwell platforms, this is feasible because the wells are grouped together. 4 refs.

Gruppung, A.W. (Delft Univ of Technology, Delft, Neth). *Oil Gas J* v 85 n 52 Dec 28 1987 p 113-115.

**073123 OPTIMAL WORKING PRESSURE FOR THE GAS LIFT IN A MULTIFORMATION FIELD.** A method of determining the optimal working fluid injection pressure is proposed which ensures minimum energy consumption in raising the oil in a group of gas-lift wells drilled into inhomogeneous horizons. Maximum accuracy in calculations according to this method may be attained by using adapted mathematical models which describe the relation between the parameters of motion of the gas-liquid mixture. In Russian. 3 refs.

**073124 HIGH-PRESSURE GAS LIFT FOR DEEP, SOUR PRODUCTION.** An innovative high-pressure N<sub>2</sub> gas-lift design has been used to return several wells to production in the Jay/Little Escambia Creek (LEC) field of northwest Florida. The N<sub>2</sub> was available from a field tertiary injection project and provided the means for the first continuous N<sub>2</sub> lift system, and some of the deepest gas-lifted wells in operation. The design accommodates the unique demands of gas-lifting a deep, sour oil well with high water cuts through the operation of a continuous N<sub>2</sub> lift system. Because the project design was not limited to conventional artificial lift techniques, a solution was achieved with the resources available. The high-pressure N<sub>2</sub> lift enabled wells to return to production that would not have been economically attractive or mechanically feasible with a standard hydrocarbon gas lift or submersible pump design. (Author abstract) 5 refs.

**073128 EXPERIENCE WITH PUMPOFF CONTROL IN THE PERMIAN BASIN.** Shell Western E&P Inc. has installed pumpoff control on more than 2,500 sucker-rod pumping wells in the Permian Basin during the last 12 years. These systems fall into three basic categories: stand-alone analog devices, stand-alone microprocessor units with optional communication capabilities to a central computer, and a centralized system where well data are communicated to a central computer for pumpoff decisions. Evaluation has shown that production can be maintained or slightly increased while energy consumption and maintenance expense are substantially reduced. The pumpoff controllers also provide well data that are beneficial in maintaining good surveillance. (Author abstract) 6 refs.

**073130 CO<sub>2</sub> HUFF 'N' PUFF PROCESS IN A BOTTOMWATER-DRIVE RESERVOIR.** Two CO<sub>2</sub> huff 'n' puff projects were conducted in the 4,900-ft [1495-m] Reservoir (BA) Sand Unit [4900'R(BA)SU], Timbalier Bay field, Louisiana. This reservoir is a bottomwater-drive reservoir with a 26° API [0.9-g/cm<sup>3</sup>] oil gravity and 18% primary oil recovery. Before CO<sub>2</sub> injection, both project wells were gas lifting more than 1,000 BFPD [160 m<sup>3</sup>/d fluid] with 99% water cuts. After CO<sub>2</sub> injection, the production from each well increased to 200 BOPD [32 m<sup>3</sup>/d oil]. This paper discusses the CO<sub>2</sub> huff 'n' puff process, specific reservoir characteristics, and project evaluation. 14. AA Refs.

**073131 GAS LIFT IN BASS STRAIT.** Gas lift has proved a most effective artificial lift method for the fields operated by Esso Australia Ltd in Bass Strait for the Esso-BHP joint venture. Gas lift is now used to produce approximately 5 st ML/d of the total crude production from the Strait. It has enabled wells to be produced to water cuts higher than 90 per cent, increasing the oil recovery from the fields by up to 35 per cent. Gas lift work in Bass Strait to date has included the use of special packoff gas lift assemblies for wells with sliding sleeves, the development of a tool to assist the opening of the sleeves, improved operating techniques to limit slugging from gas-lifted wells, and the testing of gas lift performance. **Heavy Oil** See Also OIL FIELDS—Computer Simulation; OIL FIELDS—Field Development.

**073132 APPLICATION OF HORIZONTAL WELLS IN THE SIMULATION OF HEAVY OIL RECOVERY PROCESS.** Field experience as well as experimental and numerical modelling have shown that inherent gravity override, poor vertical sweep and low productivity characterize the displacement process in many steamflood and hot waterflood projects. In particular sand bodies, horizontal wells offer the possibility of placing the injected fluid in a specified area of the system. Representation of the horizontal well continuum by appropriate discretised models and analytical expressions for productivity indices allows us to define horizontal wells in a finite difference numerical simulator. The calculation of these productivity indices is achieved through a conformal mapping technique. (Edited author abstract) 18 refs.

**073133 O.** Without the application of innovative equipment and operating techniques, a reservoir containing an estimated 40 million m<sup>3</sup> (250×10<sup>6</sup> bbl) of heavy oil-in-place would have remained unproductive. Progressive cavity pumps provided the most flexible, cost-effective option to exploit this difficult formation. Through the optimization of this unique equipment and associated operating techniques by both the producing and service companies involved, economic development has been made possible. This paper describes the evolution of the progressive cavity pump system in the development of the Clearwater Formation in the Lindbergh-Elk Point field. Modifications made to the equipment design and techniques to optimize pump sizing and pump run lives are discussed. (Edited author abstract)

**073134 D.** The most persistent problem facing heavy oil producers is sand production. Frequent servicing caused by sand may increase the operating cost per barrel of oil dramatically. Disposal of the large volumes of sand produced also continues to be a problem. The oil and gas industry has investigated methods of sand control on primary wells for 25 years. Early attempts were largely unsuccessful and the investigation was not aggressively pursued. In the 1980s Dome's interests and control was stimulated by higher sanding frequencies associated with the start-up of various thermal projects. This paper reviews Dome's experience with sand control for various projects. (Edited author abstract) 6 refs.

**073135 DOWNSTREAM PLANNING AND INNOVATION FOR HEAVY OIL DEVELOPMENT - A PRODUCER'S PERSPECTIVE.** The complexion of the Canadian oil industry will change rapidly in the next ten years as a dramatic increase in heavy oil production replaces dwindling conventional oil reserves. This sharp rise in Canadian heavy oil production will result in unique demands on the downstream sector of the industry. These demands will present a whole new range of technical problems and opportunities for innovation. Downstream concerns specifically include a potential diluent shortage, pipeline capacity restrictions and availability of markets. This paper presents potential solutions including upgrading and others viewed from the producer's perspective. (Edited author abstract) 27 refs.

**073136 ANALYTIC MODEL FOR ANALYZING THE EFFECTS OF DISSOCIATION OF HYDRATES ON THE THERMAL RECOVERY OF HEAVY OILS.** An analytic model is given that includes the effects of the

presence of hydrates in a thermal recovery process. The model considers continuous injection of steam into a reservoir containing an oil zone overlain by a hydrate zone. Although part of the steam is consumed in dissociation of hydrates to gas and water and dissociated hydrate zone acts as a thief zone for steam, there is a reduction in heat losses to the overburden because of the 'insulation' effect of overlying hydrates. Thus, the net reservoir heat efficiency is not significantly affected by the presence of hydrates. Although the model does not address the effect of gas generated from hydrate dissociation, it is speculated that the dissolution of the gas will cause oil swelling, oil-viscosity reduction, and improved steamflood performance. (Edited author abstract) 23 refs.

**073137 EFFECT OF SOLVENT ON STEAM RECOVERY OF HEAVY OIL.** Solvents and light ends of crudes are frequently used as diluents to facilitate pumping and pipeline transportation of heavy crudes. The use of solvent alone for in-situ recovery of heavy oil tends to be limited because of its high cost; however, the use of solvent as an additive to steam processes has been tested both in the laboratory and in the field. The results of these tests are mixed. The authors use numerical experiments to delineate the recovery mechanism of a steam-slug process when solvents are present. A good understanding of the mechanism will help provide an interpretation of the conditions under which solvents can improve steam oil recovery. The study focuses on the use of small quantities of solvent - i.e., no more than 10% of the steam volume. (Author abstract) 14 refs.

**073138 FLUID FLOW AND SAND PRODUCTION IN HEAVY-OIL RESERVOIRS UNDER SOLUTION-GAS DRIVE.** The production of heavy oil in Canada has led to a number of anomalous results, most of which have been excused as high-permeability channels resulting from sand production. The methods of soil mechanics predict gross formation failure resulting from high fluid compressibility, small cohesion, and high viscosity. Gross failure results in excellent productivity but reduced in-situ stress (and fracture stress). Solution-gas drive in these reservoirs involves simultaneous-mixture flow of gas as very tiny bubbles entrained in heavy oil. Stress, geometry, and permeability alteration resulting from matrix deformation combined with peculiar pressure-dependent multiphase-flow properties result in a new model of reservoir performance. (Edited author abstract) 19 refs.

## In Situ Combustion

**073139 LOW-TEMPERATURE-OXIDATION KINETIC PARAMETERS FOR IN-SITU COMBUSTION: NUMERICAL SIMULATION.** The principal objective of this study was to provide low-temperature-oxidation (LTO) reaction models that are suitable for use in numerical simulators of in-situ combustion for bitumen and heavy-oil reservoirs. A systematic study investigated the LTO reactions of the liquid-phase components of bitumen and heavy oils. Athabasca bitumen, free of water and minerals, was oxidized by use of a laboratory-stirred semiflow batch reactor. Kinetic studies were carried out in the 333 to 423 K [140 to 300°F] temperature range and at an oxygen partial pressure of 50 to 2233 kPa [7.3 to 324 psi]. The total pressures applied in the reactor ranged from 2190 to 4415 kPa [318 to 640 psi]. Experimental data were collected in the kinetic subregime. (Edited author abstract) 21 refs.

Adegbesan, K.O. (Texaco Canada Resources Ltd); Donnelly, J.K.; Moore, R.G.; Bennion, D.W. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 12004, p 573-582.

**073140 OXYGEN FIREFLOODING: COMBUSTION TUBE TESTS WITH LIGHT, MEDIUM, AND HEAVY CRUDE OILS.** Five light, medium, and heavy crude oils were evaluated in a combustion tube, primarily at 750 and 2000 psig [5.2 and 13.8 MPa] and with  $O_2$  concentrations between 21 (air) and 95%. The overall characteristics of combustion with  $O_2$  appear to be superior to those with air. For light and medium crude oils, when the combustion conditions are marginal (e.g., at low temperatures at which the kinetics appears to control coke combustion), the apparent kinetics and the quality of the combustion were substantially improved when  $O_2$  enrichment was used. Three of the crude oils in this study did not burn in air; however, with the same flux of contained  $O_2$ , high levels of  $O_2$  enrichment could sustain combustion. (Edited author abstract) 12 refs.

Shahani, Goutam H. (Air Products & Chemicals Inc); Hansel, James G. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 12726, p 583-590.

**073141 CATALYTIC EFFECT OF HEAVY METAL OXIDES ON CRUDE OIL COMBUSTION.** Differential scanning calorimetry (DSC) and thermogravimetric analysis (TGA) were applied to crude oil combustion in the presence and absence of metal oxides. It was found that the effect of titanium oxide was similar to that of silica and alumina. Vanadium, nickel, and ferric oxides behaved similarly in enhancing the endothermic reactions. In the presence of a large surface area such as with silica, the surface reactions are predominant and unaffected by the small amount of metal oxide present. Kinetic analysis of the DSC curves revealed that the activation energies and the frequency factors of the hydrocarbon and the coke combustion reactions, estimated for all the metal oxide additives including silica and alumina, followed the same normal compensation trend. The application significance of this work lies in an EOR process called in-situ combustion. 12 refs.

**073142 SIMPLIFIED PERFORMANCE-PREDICTIVE MODEL FOR IN-SITU COMBUSTION PROCESSES.** A one-dimensional (1D) model to perform rapid calculations of fluid production history for dry and wet forward in-situ combustion processes is presented. The predominantly explicit, discrete timestep formulation divides the reservoir into four zones of constant properties, separated by shock fronts. Model results are compared with a 1D simulator study of a combustion-tube experiment and with field data from the Suplacu de Barcău project. (Author abstract) 26 refs.

Genrich, J.F. (Sohio Petroleum Co); Pope, G.A. *SPE Reservoir Eng* v 3 n 2 May 1988 SPE 14242, p 410-418.

**073143 FIELD SCALE IN-SITU COMBUSTION SIMULATOR WITH CHANNELING CONSIDERATIONS.** A new and numerically stable algorithm has been developed to achieve the desirable fuel consumption. This algorithm involves an oil-flow-enhancement scheme. Arrhenius-type reactions have been found to be inadequate in field-scale combustion simulation. A new pseudokinetic scheme is introduced to field-scale studies in which the reaction zone is not simulated accurately because of the large size of the gridblocks. In some in-situ combustion projects, viscous fingering and channeling phenomena can affect the efficiency of the combustion process. A new formula of molecular diffusivity of oxygen has been introduced to represent the contact efficiency of the reactants. (Edited author abstract) 21 refs.

Ito, Yoshiaki (Gulf Canada Resources Ltd). *SPE Reservoir Eng* v 3 n 2 May 1988 SPE 13220, p 419-430.

**073144 IN-SITU COMBUSTION IN THE LOWER HOSPAH FORMATION, MCKINLEY COUNTY, NEW MEXICO.** To evaluate the pilot test and to determine the reasons for its performance behavior, a reservoir model of the test site was developed from the historical performance of secondary recovery operations

in conjunction with available log and core data. The result was a three-layer, four-quadrant model of the test site. The volumetric sweep efficiency of the combustion front was estimated from two interior core holes drilled after the project was terminated. This resulted in a postcombustion model of the test site depicting the vertical sweep of the combustion front. Stoichiometric relationships were used to evaluate the combustion performance of each layer of the model. The stoichiometric evaluation provided a means to compare quantitatively the postcombustion reservoir model with actual test performance, thus verifying the model. (Edited author abstract) 7 refs.

## Leak Detection

**073146 NITROGEN/HELIUM LEAK DETECTION USED ON NORTH RANKIN 'A' PLATFORM.** In the past, leaks were found by pressuring the process systems first with water and then with hydrocarbons. This low cost but hazardous method of leak detection used gas detectors and soapy water to detect gas leaks. The disadvantage of this method is that large leaks contaminate the environment, risk a possible explosion and fire, and can result in a considerable loss of product. In the last few years, NOWSCO Well Service Ltd has developed a leak test process utilizing nitrogen mixed with helium as a tracer gas. With this innovative technology the industry is now able to eliminate the use of hydrocarbons during leak testing, and detect leakage rates as small as 0.1 cubic foot per year. This nitrogen/helium leak testing method was used on North Rankin 'A' platform. (Edited author abstract) 2 refs.

**073148 NOVEL FPSO FACILITY SERVES THREE NIGERIAN OIL FIELDS.** The recently installed Antan floating production, oil storage and offloading (FPSO) facility designed, installed and operated by Single Buoy Moorings Inc, according to Ashland Oil Co. (Nigeria) specifications, is the first such installation to handle

production from more than one offshore oil field. Permanently moored to a conventional fixed platform in 125 ft of water 22 miles off Nigeria, the FPSO vessel is equipped to handle up to 80,000 bpd through parallel process trains of 40,000 bpd each. Currently handling a total output of 25,000 bpd from Adanga and Akam fields in Ashland's offshore concession OPL 98, the facility has the capability of having additional fields connected at a later date. A soft yoke mooring designed to withstand 100-year storms allows the vessel to weathervane about the platform.

Eppley, D.R. (Ashland Oil Co, Houston, TX, USA); Davison, N.J.; Beare, A. *Ocean Ind* v 22 n 1 Jan 1987 p 30, 32-33.

**073149 HOW PENROD PLANS TO DRILL FROM THE BLOCK 29 FPS.** In the fall of 1987, Penrod Drilling Co.'s Penrod 72 semi-submersible will be moored on location over Placid Oil Co.'s Gulf of Mexico Block 29 subsea template in 1,522-ft water to begin a 15-year life both as a permanent floating production system (FPS) and as industry's first-ever MODU that drills and produces simultaneously. Placid and Penrod, in choosing the first-of-a-kind deepwater development scheme, faced the unique challenge of converting a 12-year-old vessel, which has drilled primarily deepwater exploratory wells into a floating platform designed to drill and complete multiple development wells in the most expeditious and economical method. Refs.

Anon. *Ocean Ind* v 22 n 7 Jul 1987 p 17-20.

**073150 SELM/ITALIAN CONTRACTORS READY VEGA A FOR FIRST OIL.** First oil from the giant Vega field, located some 13 miles off the southeastern coast of Sicily in 410-ft water is expected in July. Discovered in 1980, field development has proceeded under the direction of the operator, SELM S.P.A., a subsidiary of the Montedison Group of Milan. This paper details the operations directed by SELM that will allow the first barrel of Vega oil to flow through tied-back template wells, platform production system, subsea lines and single-point mooring to the permanently moored Vega Oil storage tanker, where each participating company will take its oil in kind for shuttle tanker delivery to a refinery of its choice. These operations include: rigging up for platform drilling, tie-back and completion of suspended template wells, commissioning of platform production facilities, special design/installation of seabed lines, and principal storage tanker features. 4 refs.

**073151 NEW SYSTEM INSTALLS HEAVY SUBSEA COMPONENTS SAFELY.** The Mobile-Designed Subsea Atmospheric System (SAS), which is presently undergoing final development, comprises three heavy components, two of which must be lowered in deep water, precisely oriented and mated with controlled vertical velocity. A submerged motion compensator and a positive wire rope positioning program are to be used to achieve precise placement of these components on the seafloor.

Anon. *Ocean Ind* v 22 n 8 Aug 1987 p 41-42.

**073152 KITTIWAKE PROJECT WILL PACE GANNET AREA DEVELOPMENT.** After low oil prices forced operators to shelve plans for a \$3.2-billion Gannet area development, engineers came up with a low-cost solution to make Kittiwake field a stand-alone project. After exploring a wide range of options - including a floating production system that was found to offer no significant economic advantage - the optimum solution was identified as a multi-well 15,000-mt slimline fixed platform linked to a Single Buoy Mooring. The resulting \$350 million (\$560-million) development proposal for Kittiwake - now awaiting approval from the UK Department of Energy - is about 40% under initial cost estimates.

Anon. *Ocean Ind* v 22 n 8 Aug 1987 p 49-50.

**073153 ENVIRONMENTAL PROTECTION MANAGEMENT IN OFFSHORE OIL AND GAS FIELDS.** The response of industry to environmental obligations and responsibilities has been an area of heightened debate in recent months stimulated by the European Year of the Environment, publication of the final report of the World Commission on Environment and Development, and the forthcoming Second International Conference on the Protection of the North Sea. These initiatives help to highlight the principle that industry should continue to strive for a preventative approach to the environmental consequences of its activities. The author discusses the principal elements in an environmental impact assessment. 17 refs.

Probert, P.K. (BP Int Ltd). *Pet Rev* v 41 n 489 Oct 1987 p 28, 30-32.

**073154 TELEMETRY AND CONTROL SYSTEM FOR INTERPLATFORM CRUDE LOADING AT THE STAFFJORD FIELD.** A control system for crude loading to tankers at the Staffjord field has been designed to allow tanker loading to take place at all times to prevent production shutdowns caused by loading-buoy problems. This paper discusses how the control system was designed to maximize the flexibility of loading operations and to meet all safety and regulatory requirements. The experience gained from more than 4 years of operation of the system is reviewed. The system has allowed maximum use of total field crude storage capacity while loading to 125,000-DWT [127 000-Mg] tankers nearly every day throughout the year. It has been possible to maintain a high production rate even through the periods of difficult weather conditions experienced in the northern North Sea. (Author abstract)

**073155 COMPOSITE LEG PLATFORMS FOR DEEP U.S. GULF WATERS.** A new fixed platform design, embodying two configurations which simplify and reduce the cost of fabrication and installation and improve structural performance in-place, has been developed by Hudson Engineering, a McDermott Company. Studies indicate the patented Composite Leg Platform (CLP) is more efficient than the conventional fixed platform at 1,600-ft water depths and that the Compliant Composite Leg Platform (CCLP) is economically attractive to at least 3,000 ft in the Gulf of Mexico. Basic configurations of the CCLP and the CLP are very similar, with exception of those features used to produce the desired compliant or non-compliant in-place response. In each configuration, piles are clustered around corner legs, and extend vertically several bays above the mudline. In the non-complaint mode, it is desirable under some circumstances to support the jacket with piles driven through the legs in bottom levels. Once these piles have been grouted to the jacket legs, they form a 'composite leg' section. 8 refs.

Will, Stephen A. (McDermott Co, Houston, TX, USA); Morrison, Denby G.; Calkins, Dennis E. *Ocean Ind* v 23 n 3 Mar 1988 p 23-28.

**073156 MAJOR OFFSHORE WORK READIES PLACID FIELD FOR STARTUP.** Not since Exxon installed the Lena field guyed tower in 1983 has the Gulf of Mexico seen so much innovative offshore work as has taken place in conjunction with Placid Oil's development of the Green Canyon Block 29 area (GC 29). Working in water depths ranging from 550 to 2,300 ft, Placid and its principal contractors have been breaking records and establishing firsts at an impressive pace. The achievements include: installation of the largest and most sophisticated permanent mooring system ever set in the Gulf of Mexico, deployment of the first floating production platform in the Gulf, completion of the deepest production well in the Gulf and the second deepest in the world, running of the world's largest and most technologically advanced production riser, and installation of flowlines by the bottom-tow method for the first time in the Gulf.

McCabe, Charles (Ocean Industry, Houston, TX, USA).

*Ocean Ind* v 23 n 3 Mar 1988 p 36-39, 42-45.

**073157 RISER TESTS MOVE AHEAD ON ADRIATIC PLATFORM.** Agip is proceeding with an extensive research project on a Tension Leg Platform (TLP) for oil production in very deep waters. One of the most challenging problems encountered in designing a TLP is the safe design of the production risers. To acquire reliable experimental data needed for properly designing an array of deepwater risers, a full-scale riser test was organized. The basic approach is to install a single, or a pair of, instrumented risers on a gas production platform newly installed in the Barbara field in the Adriatic Sea at a water depth of about 70 meters. A description is given of the surface and bottom equipment used for the tests, and the test categories planned for a single-riser configuration and for two-riser tests are indicated.

Campelli, P. (Agip SpA); Berta, M.; Basu, A.C. *Ocean Ind* v 23 n 4 Apr 1988 p 103, 105, 107.

**073158 SWOPS: OIL PRODUCTION, STORAGE AND TRANSPORT SYSTEM.** The SWOPS production system has been devised by BP as a means of producing oil from small offshore fields that would be considered uneconomic to develop from fixed platforms or by other more conventional means. The system can also provide a relatively low-cost method of testing a reservoir over a long period to assess if a discovery is worthy of development. SWOPS is to be built for BP, as a joint venture, by Harland and Wolff of Belfast. Matthew Hall Engineering is responsible for design, procurement and installation of the process facilities, riser system and ROV handling facility. BP's Cyrus Field in Block 16/28 in the U.K. North Sea will be the first to be developed using the SWOPS system. (Edited author abstract)

Anon. *Oil Gas Eur Mag* v 13 n 1 1987 p 22.

**073159 DIMOS: DIVERLESS INSTALLABLE AND MAINTAINABLE OIL PRODUCTION SYSTEM.** Starting less than 40 years ago in the coastal swamps of Louisiana, the offshore industry has since progressed into ever deeper waters. Today, production of hydrocarbons in just over 300 metres water depth is a reality. But because exploration for oil and gas continues in even greater depths, beyond the present limit of human intervention by hyperbaric diving, new production systems must be designed which can be installed and maintained without the help of divers. Using the experience gained in a wide variety of offshore situations worldwide, Shell has developed a conceptual production system for a hypothetical oil field in 600 metres water depth and harsh environment in order to meet the challenge offered by successful exploration in such great depths. Some parts of the subsea engineering for the DIMOS project have been carried out in Norway. (Author abstract)

Anon. *Oil Gas Eur Mag* v 13 n 1 1987 p 23.

**073160 SAS: SUBSEA ATMOSPHERIC SYSTEM.** The search for oil and gas around the world has led to oil exploration activities into increasingly deeper waters. As the depth increases, the reserves must be increasingly larger in order to justify field development with fixed platforms. At a depth of 300 meters, the reserves must be very large if a fixed platform is to be installed, and at greater depths it is hardly economical to develop a field with fixed platforms. The alternative is to use subsea production systems, either in connection with a fixed installation, which makes it possible to exploit a greater area, or in combination with a floating platform. Offshore operators can now take advantage of a fully developed subsea production system, the Mobil, Statoil, and Kvern jointly developed hybrid Subsea Atmospheric System (SAS), that bridges the gap between wet and dry systems, following comprehensive final work on proving the concept. (Author abstract)

Anon. *Oil Gas Eur Mag* v 13 n 1 1987 p 25.

**073161 TURRET MOORING COMPLETES WORLD'S LARGEST FSO SYSTEM.** In January 1988,

SOFEC Inc. completed design and construction of a turret mooring system for Yemen Exploration & Production Co. (YEPSCO). The turret mooring was constructed and mounted to the bow of the 409,000 DWT tanker Safer. Safer sailed to location and was installed at YEPSCO's offshore site in the Yemen Arab Republic (formerly North Yemen) where first oil flowed on March 22, 1988. Formerly ESSO Japan, the tanker, and its production facilities, constitute the largest permanently moored floating storage and offloading (FSO) system in the world. Described in this paper are details of the single point mooring turret, how it was designed, built and installed, and how it operates. Also presented is an overview of the FSO storage and offloading system with emphasis on the crude handling risers, swivel, valves and controls.

Optimization See Also OIL FIELDS—Management.

**073162 OPTIMIZE PRODUCTION THROUGH BALANCED RESERVOIR DEPLETION: PART 1 - METHODS AND DATA REQUIRED.** A description is presented of the basic reservoir study that describes rock properties, fluid properties, structure, volumetric reserve analysis, material balance, production decline curve analysis, reservoir compositional model, and development of in-flow performance. The three methods for increasing and decreasing production with electric subsurface pumps (ESPs) are discussed. In addition, rate and pressure tests are examined.

Patton, L. Douglas (L.D. Patton & Associates, Aurora, CO, USA). *Pet Eng Int* v 60 n 7 Jul 1988 p 23-25.

Performance

**073163 FAHUD FIELD REVIEW: A SWITCH FROM WATER TO GAS INJECTION.** The water injection schemes implemented in the Fahud field during the early 1970's led to poor recoveries because the reservoirs were both fractured and oil-wet. On the basis of the results of a thorough performance review, it was decided in 1983 to promote gas/oil gravity drainage fully by drilling rows of downip producers and switching completely from water to gas injection. This paper investigates the reasons behind each stage of development and reviews recent efforts to evaluate the future production potential through the use of dual-porosity simulators. **073164 PRODUCTION PERFORMANCE ANALYSIS OF HORIZONTAL DRAINAGE WELLS FOR THE DEGASIFICATION OF COAL SEAMS.** The production performances of horizontal drainage wells for the degasification of coal seams have been investigated with a multidimensional, two-phase coal-seam degasification model. The model is written in rectangular coordinates, can handle a number of horizontal wells, and operates in a one-, two-, or three-dimensional (1D, 2D, or 3D) mode. The model accommodates multiple horizontal boreholes originating from a common vertical shaft or horizontal boreholes being drilled from the peripheries of the reservoir. In consideration of the relatively thin but large lateral extent of coal seams, flow dynamics around a horizontal borehole is described in elliptic flow geometry. (Edited author abstract) 14 refs.

**073165 NEW APPROACH TO THE HYPERBOLIC CURVE.** An efficient and timesaving approach to hyperbolic-decline-curve analysis has been developed that has made it possible to determine the hyperbolic b exponent characterized by thousands of wells. After extensive use of the technique, the authors concluded that the range of the b exponent previously prescribed by J.J. Arps is too

narrow. The type curves are marked to exhibit instantaneous equivalent annual decline rates. In addition to its simplicity, this technique provides the engineer with a straightforward visual understanding of historical performance and a clear grasp of potentially expected future production trends. (Edited author abstract). 7 refs.

**073166 ANALYTICAL MODEL OF UNSTABLE IMMISCIBLE FLOW.** An analytical method is developed for calculating pseudo relative permeabilities which can be used to describe the average properties of unstable immiscible flow. The predictions of this model are in good agreement with the results of numerical simulations of unstable flow using a Monte Carlo solution technique. (Author abstract) 9 refs.

Hughes, D.S. (UKAEA, Dorchester, Engl); Murphy, P. *Soc Pet Eng AIME Pap SPE* n 017473 1987 15p.

**073167 USE OF A MONTE CARLO METHOD TO SIMULATE UNSTABLE MISCIBLE AND IMMISCIBLE FLOW THROUGH POROUS MEDIA.** A Monte Carlo (statistical) solution technique has been implemented within the framework of a conventional simulator for two phase, or two component, flow. The implicit pressure equation is solved in the usual way. However, the explicit equation, describing the rate of change of saturation or concentration of the invading fluid with time, is interpreted as a probability density function and solved statistically. This method automatically triggers an unstable solution when the mobility ratio is unfavourable. The algorithm has been applied to a series of both linear and quarter five-spot miscible and immiscible problems, and the results are presented and discussed. (Edited author abstract) 7 refs.

Hughes, D.S. (UKAEA, Dorchester, Engl); Murphy, P. *Soc Pet Eng AIME Pap SPE* n 017474 1987 24p.

**073168 MEASUREMENT AND CORRELATION OF DIFFUSION COEFFICIENTS FOR CO<sub>2</sub> AND RICH-GAS APPLICATIONS.** A novel in-situ method for measuring molecular diffusion coefficients of CO<sub>2</sub> and other solvent gases in consolidated porous media at high pressure has been developed and is described. This technique is unique because visual observations and measurements of composition are not required. Experimental diffusion coefficients are reported for CO<sub>2</sub> in decane up to 850 psia [5.86 MPa], for CO<sub>2</sub> in 0.25 N NaCl brine up to 850 psia [5.86 MPa], and for ethane in decane up to 600 psia [4.14 MPa]. All tests were conducted in Berea cores saturated with liquid phase at 100°F [311 K]. Cores were oriented both vertically and horizontally to assess the effects of gravity-induced convection on the observed mass transfer. (Edited author abstract) 28 refs.

**073169 RECORD RELIABILITY FOR THE FIRST SUBSEA PRODUCTION SYSTEM IN THE NORTH SEA.** Since oil was first discovered in the North Sea, operators have been constantly searching for methods which will enable natural reserves to be fully exploited. But because of a health desire to protect their investment the major oil companies view any departure from conventional technology with a critical eye. In this environment Shell in a joint venture with Esso decided to install a subsea production system which threatened to revolutionize automated offshore oil production. Since the first oil

was produced in 1981 from this system a 95% record of availability has been achieved, and the technology has been utilized by many companies to fully exploit natural offshore oil and gas deposits.

Dempster, J. (Ferranti Subsea Systems Ltd). *QJ Tech Pap Inst Pet* Jul-Sep 1986 p 83-84.

**073170 DEEPWATER TECHNOLOGY FOCUSING ON PRODUCTION.** Designed for operation in up to 2,600 ft of water, the Mobil system is said to have a price tag equal to that of a fixed platform system in about 1,300 ft of water. The system provides for total production capability in a severe environment, including full well control, downhole servicing, gas lift, water and gas injection, oil storage, and tanker offloading. It can be used for either gas or oil fields, and seafloor components can be used in conjunction with nearby platforms in shallower water. Although designed for maximum reliability and minimum maintenance the system provides for manned intervention for equipment maintenance and operational changes by oil field technicians. Major components of the system are discussed. Other deepwater production activities and equipment are also briefly examined.

**073172 DIMOS PROJECT: TECHNOLOGICAL BREAKTHROUGH.** The DIMOS project, a conceptual development aimed at achieving oil production from deep waters and in harsh environments without the use of divers, has made a major step forward. The multi-bore connector, one of the key elements of the systems seabed manifold, has successfully completed its initial tests. The DIMOS is designed to meet the requirements of a future deepwater oil field, where some twelve subsea satellite completed production wells would flow up to a total of 60,000 barrels per day. To increase hydrocarbon recovery and maintain reservoir pressure, eight water injection and six gas injection wells would also be completed subsea. The system is applicable for the production of oil from fields located in water depths beyond the reach of hyperbaric divers in areas with maximum wave heights of 30 m and surface currents of 1.5 m/s. The system is designed to enable the various components to be arranged in a variety of combinations of type and size in order to meet a wide range of specific field conditions.

Anon. *Mar Technol* v 17 n 4 Nov 1986 p 142-143.

**073173 LAST MAJOR TESTS CLEAR SAS FOR NORTH SEA APPLICATIONS.** Testing of a full-scale flowline connection system in Norway has marked a successful end to four years of intensive work on the hybrid Subsea Atmospheric System (SAS) for oil and gas production. This final series of tests established that the connection system and its built-in safety features will function as intended. The system is a subsea, multiwell assembly that features wet wellheads directly connected to a dry atmospheric chamber, within which oil/gas production is separated. From the chamber, oil and gas streams are transmitted to a pipeline bundle for transfer to a surface handling facility. Personnel can periodically enter the subsea chamber and work in a shirt-sleeve, one atmosphere environment. Present designs make the complex workable in water depths to 800 m (2,600 ft).

**073174 ASSESSMENT OF PRODUCTION REGULARITY FOR SUBSEA OIL/GAS PRODUCTION SYSTEMS.** A model for subsea oil/gas production systems, being useful for carrying out production regularity studies, is presented. Formulas for calculating approximate (asymptotic) mean values of interesting reliability parameters within this model are derived. The use of these formulas is exemplified and discussed for a rather simple example. It is argued that the approximate formulas should be used in an interaction with Monte Carlo simulation, giving a powerful approach to the problem of assessing the availability (production regularity) of a subsea production system. **073175 DEVELOPING MARGINAL FIELDS WITH REMOTE SUBSEA SYSTEMS: PART 1 - PRODUCING SYSTEM ALTERNATIVES THAT SHOULD BE CONSIDERED AT PROJECT CONCEPTION TO ATTAIN MAXIMUM OPERATING FLEXIBILITY AT LEAST COST.** This paper is the first of two on development options for marginal offshore reserves using remote systems tied back to a host platform for production handling. In this paper, the advantages, disadvantages and cost implications of available subsea producing facilities are discussed. 2 refs.

Hunt, R.A.M. (Oilfab Group, Aberdeen, Scotl); Lorimer, E.P. *Ocean Ind* v 23 n 4 Apr 1988 p 15-18.

**073176 REMOTE SUBSEA SYSTEM CONTROLS DISTANT WELLS.** The Elf Aquitaine Group has developed and successfully tested a system that remotely controls subsea wellheads at distances to 12.4 miles. Manufactured by the French company ECA under the acronym, 'IRCUS' (Intelligent Remote Controlled Underwater System), it is an electro-hydraulic, multiplexed system based on programmable equipment. Operating from its remote location, IRCUS also monitors data that includes pressures, temperatures, limit switches, pressure switches, etc. The system is self-checking, will compensate for minor faults which may arise, and can switch to pre-programmed safety procedures if serious failures occur.

Anon. *Ocean Ind* v 23 n 4 Apr 1988 p 64.

**073177 PROTOTYPE ACOUSTIC SUBSEA WELL CONTROL INSTALLED.** A research and development project named Subsea Wells Acoustic Control System (SWACS) has been developed. The system can control and monitor up to 15 wells in water depths up to 1,000 m. No umbilicals to the surface are required, either for the electric or hydraulic lines. The system relies on a lithium battery for long-term energy storage and on acoustic telemetry for signal transmission. It also features low power consumption electronics with intrinsic well safety procedures and closed loop hydraulics. The control module can be installed without guidelines, with dedicated positioning, soft landing and orientation systems. It also features remotely operated subsea electrical and hydraulic connectors.

**073178 TECHNICAL PROBLEMS SPUR DEEP-WATER R&D ACTION.** Highlights of three ongoing research efforts by ENI companies focus on technical and economical solutions to handle untreated multiphase subsea well fluids, develop a completion system for 3,280-ft water and repair pipelines in ultradeep water. This article summarizes the status of these three programs aimed at providing solutions to develop offshore marginal and deepwater fields beyond conventional water depth levels, with particular emphasis on underwater robotics. 1 ref.

Anon. *Ocean Ind* v 23 n 4 Apr 1988 p 95-96, 101-103.

**073179 NEW SUBSEA TREE DESIGNED FOR NORTH SEA FIELDS.** The Amerada Hess group is using a floating production system and a new universal Christmas tree design with unique features in its subsea development of Ivanhoe and Rob Roy fields in the UK North Sea. In addition, a special dual workover riser package has been provided to facilitate well maintenance via wireline or coiled tubing.

Anon. *Ocean Ind* v 23 n 4 Apr 1988 p 144.

**073180 MULTIBORE MODULE CONNECTS SUBSEA MANIFOLD, PIPELINES.** Kongsberg Subsea Systems has developed a retractable horizontal multibore connector to tie the pipelines, flowlines and service lines into underwater manifolds. The device, manufactured for use on A/S Norske Shell's deepwater production system, is designed to simplify connecting multiple lines to the maze of piping on complex subsea gathering stations. Successful testing of the connector proved the feasibility of using such a connector mechanism in both horizontal and vertical applications, eliminating the requirement for flexibility to be built into connecting pipework.

**073181 PETROBRAS MAINTAINS LEAD IN SUBSEA COMPLETIONS.** Petrobras provided further evidence in January that it is the leader in subsea production technology. The Brazilian national oil company completed well 3-RJS-376D at a depth of 1,614 ft subsea to extend by 240 ft the world water depth record it had set only last November with Albacora-field well 4-RJS-328. RJS-376D is the fourth in a set of Marimba field wells that Petrobras has used to test its diverless completion equipment and methods. All four wells have been successfully brought onstream. Petrobras is presently specifying diverless layaway trees for all wells in water depths between 300 and 600m. Current layaway technology is being pushed step-wise for depths in the 600 to 1,000-m range. Petrobras is working under long-term agreements with suppliers to develop technology for completion systems for water depths to 1,800 m.

Anon. *Ocean Ind* v 23 n 4 Apr 1988 p 5.

**073182 DEVELOPING MARGINAL FIELDS WITH REMOTE SUBSEA SYSTEMS; PART 2.** Part 1 of this series dealt with advantages, disadvantages and cost implications of development with a subsea production center, cluster wells serving a small manifold, and satellite wells producing through a small manifold. This concluding installment discusses operating and economic factors that can help in selecting the most cost-effective pipeline system between subsea facilities and host platform, riser access system to bring production to the platform deck, and platform processing facilities. 2 refs.

**073183 SUBSEA WIRELINING INNOVATION OPERATIONAL AT KEPITING.** Conoco Indonesia has developed Kepiting oil field in the Natuna Sea, Indonesia, as a satellite to its larger Udang field located some 5 miles northeast. Kepiting has two subsea wells in 295-ft water which produce into the floating production storage and offloading (FPSO) barge called Production Barge San Jacinto (PBSJ). For economic reasons, Conoco has designed a unique well maintenance/workover system which permits wireline work on the two wells using only a workboat and a portable riser/lubricator base. This surface riser/ buoy system is deployed and attached, as needed, to 240-ft riser and subsea buoy systems permanently mounted on each well. 3 refs.

**073184 DIVERLESS SUBSEA SYSTEM TO PRODUCE OIL IN DEEP WATERS.** The Diverless Subsea Production System (Disps), British Petroleum Co. plc's entry into the expensive world of deepwater oil produc-

tion, will soon begin the onshore testing phase. A full scale segment of the Disps template, designed to operate in water depths to 1,300 ft, will be fabricated prior to an extensive onshore test program. Disps, BP's biggest single R&D project, is a two part project aimed at providing a system to produce oil from the outer slope of the European continental shelf in the mid 1990s. The most likely locations are in British or Norwegian waters, and the system must be capable of being upgraded for use in 2,500-ft water depths. Disps will follow the broad outlines of other deepwater, diverless systems with the wellhead and various production modules contained within a template with a capability for connecting remote satellite wells. Modules are installed and retrieved by a remote guidance vehicle.

Anon. *Oil Gas J* v 86 n 33 Aug 15 1988 p 52,54.

**073185 WET CONNECTION SYSTEM OF PIPELINE BUNDLE - SUBSEA PRODUCTION SYSTEM.** A subsea production system (SPS) for installation in water depth of over 300 m was researched for seven years under the large-scale technical research and development project of the Agency of Industrial Science and Technology, Ministry of International Trade and Industry. In this project, Nippon Steel was commissioned to perform research and development on the pipeline system. Emphasis was placed on the development of a unique wet connection system for installing pipeline bundles on the sea floor without diver assistance or guidelines. The system thus developed features the capability of repeatedly connecting and disconnecting a bundle of electric power, signal and hydraulic lines in the deepsea environment by remote control from the surface. It successfully demonstrated its functions to attain the objectives of development in various fundamental experiments, surface and underwater tests and in an integrated SPS verification test. (Author abstract) 4 Refs.

**073186 OIL EXPLOITATION AT GREATER DEPTHS.** Since the beginning of the exploitation of the North Sea oil and gas reserves two decades ago, the petroleum industry has built up its offshore capabilities in some of the most inhospitable conditions ever encountered by offshore operators anywhere in the world. As a result, petroleum companies and equipment suppliers have developed techniques for exploiting hydrocarbons at great depths - currently well in excess of 350 m - in exceptionally arduous environments and remote areas. (Author abstract).

Ford, E. (Engineering Gazette, London, Engl). *Eng Dig (Toronto)* v 34 n 4 Aug 1988 p 17-18.

**073187 EXTENDING THE INNES FIELD LIFE BY COST-EFFECTIVE SUBSEA TECHNOLOGY.** A description is given of an approach taken to extend the economic life of the Innes field, one of the North Sea's smallest producing oil fields. Emphasis is placed on the importance of minimizing production operating costs for developed fields. In the Innes field case, this was achieved by applying 'low-cost technology' to change the Innes field production mode from a dedicated floating production facility to a subsea satellite manifold producing to a remote floating production facility (FPF). The feasibility study, the Innes field flow test, and the eventual project work leading to the demobilization of the Innes field FPF and the routing of Innes field fluids to the nearby FPF Deepsea Pioneer are described, which emphasizes the cost benefits obtained by using low-cost proven technology wherever possible and limiting the use of high-cost equipment. (Edited author abstract).

**073190 LABARGE PROJECT: AVAILABILITY OF CO<sub>2</sub> FOR TERTIARY PROJECTS.** The LaBarge field in Wyoming is being developed to recover and to sell methane, as well as CO<sub>2</sub>, and helium. As a source of CO<sub>2</sub>, the LaBarge field provides oil producers in the Rocky Mountain area an opportunity to increase production in their mature fields through EOR projects. A 649-mile pipeline is planned to transport up to 650 MMcf/D [18.4 × 10<sup>6</sup> m<sup>3</sup>/d] of CO<sub>2</sub> to users throughout Wyoming and the Williston basin. A CO<sub>2</sub> marketing survey indicates potential CO<sub>2</sub> demand of 4.4 Tcf in the planned marketing area for EOR. About 25% of the CO<sub>2</sub> demand identified is already contracted. LaBarge CO<sub>2</sub> will allow northern Rocky Mountain operators to recover a potential and additional 1 billion bbl of oil reserves. (Edited author abstract) 1 ref.

**073191 INVESTIGATION OF UNEXPECTEDLY LOW FIELD-OBSERVED FLUID MOBILITIES DURING SOME CO<sub>2</sub> TERTIARY FLOODS.** Phase behavior, inorganic precipitation, and wettability are investigated as possible reasons for the unexpectedly low field-observed mobilities during some CO<sub>2</sub> floods, in particular, the Denver Unit, Wason field CO<sub>2</sub> pilot. The observed mobility was not a near-wellbore effect and probably played a major role in reservoir sweep: the low effective permeability offset the detrimentally low CO<sub>2</sub> viscosity. Experimental and simulation studies, supplemented by literature data, lead to the conclusion that rock wettability could be the root cause of these low fluid mobilities. (Edited author abstract) 32 refs.

Patel, P.D. (Shell Development Co); Christman, P.G.; Gardner, J.W. *SPE Reservoir Eng* v 2 n 4 Nov 1987 SPE 14308, p 507-513.

**073192 EFFECT OF INTERFACIAL VISCOSITIES UPON DISPLACEMENT IN SINUSOIDAL CAPILLARIES.** This quantitative analysis shows the relative effects of interfacial tension, interfacial viscosities, and wetting during displacement in a capillary whose radius is a sinusoidal function of axial position. The effect of the

interfacial viscosities is to increase the resistance to displacement regardless of the wetting condition. The results are consistent with a previous qualitative analysis and with a previous quantitative analysis for displacement in capillaries whose radii are independent of axial position. In screening surfactant systems for potential use in tertiary oil recovery, it is recommended that the interfacial tension be minimized first, since it determines whether oil displacement will occur, and that the interfacial viscosities be minimized second, since they influence the rate of oil displacement. (Author abstract) 41 refs.

**073193 EFFECT OF THERMAL AGING ON XANTHAN SOLUTIONS.** The viscosity stability of xanthan solutions is crucial to petroleum recovery processes. The effects of oxygen concentration, pH, and temperature on viscosity during aging up to 6 months were studied. The structure modifications of the xanthan (substituent contents, weight-average molecular weights) with aging times were followed and related to viscosity loss. In all cases, the acetyl groups were hydrolyzed. The best stability to thermal aging corresponds to neutral or basic conditions with very low oxygen concentrations. At these conditions the viscosity was stabilized to about 50% of its initial value after 6 months at 80°C. In these cases the private groups were not hydrolyzed. The stabilization of main chain breaks in the ordered xanthan conformation improves the stability results. (Author abstract) 18 refs.

**073194 DESIGN OF A TERTIARY HYDROCARBON MISCIBLE FLOOD FOR THE MITUSE RESERVOIR.** A large-scale hydrocarbon miscible flood has been designed and is being conducted in the Mitsue Gilwood Sand Unit No. 1 in Alberta, Canada. This paper reviews the evaluation and design process by use of recently developed methodologies, involving innovative laboratory techniques and simulation processes used in planning the miscible flood. Simulation studies indicate that optimum solvent and chase-gas slug sizes of 15 and 25%, respectively, will yield an incremental 12.2% of original oil in place (OOIP), or 21.3 MMSTB. Solvent and chase-gas recoveries were estimated to be 73 and 44%, respectively. (Edited author abstract) 7 refs.

Frimodig, J.P. (Chevron Canada Resources Ltd); Sankur, V.; Chun, C.K. *JPT J Pet Technol* v 40 n 2 Feb 1988 p 215-222.

**073195 MIDDLE CO<sub>2</sub> FLOOD PILOT.** The Middle oil field is part of a Mississippian carbonate trend in southeastern Saskatchewan. The Middle Unit has been under waterflood since 1962 and is approaching an 80% watercut. In an attempt to increase recovery, Shell Canada Limited and partners have begun piloting a tertiary miscible CO<sub>2</sub> process. This article focuses on the planning and design of the CO<sub>2</sub> pilot which began in 1984. The design integrates techniques from both observation and production-style pilots. The analysis of data from many sources is crucial for timely scale-up of results from the project which will conclude in 1988. (Edited author abstract) 6 refs.

**073196 RESERVOIR SURVEILLANCE PROGRAM: JUDY CREEK BEAVERHILL LAKE 'A' POOL HYDROCARBON MISCIBLE FLOOD.** In 1985, Esso Resources Canada Limited commenced hydrocarbon solvent injection into the Judy Creek Beaverhill Lake 'A' Pool. This staged miscible flood is forecast to recover an incremental 6% of the original oil in place. To ensure maximum tertiary oil recovery, Esso Resources has initiated a reservoir surveillance program. The program includes a computer system to monitor production, injection, and voidage data; a radioactive tracer program

to track solvent and waterflow; injection and production logs to monitor the zonal distribution of the injected solvent; reservoir pressure surveys to ensure solvent/oil miscibility and solvent containment; solvent injection composition monitoring; and a sampling program to monitor reproduced fluid compositions. (Edited author abstract) 3 refs.

Jonasson, Hans P. (Esso Resources Canada Ltd, Can). *J Can Pet Technol* v 26 n 6 Nov-Dec 1987 p 70-75.

**073197 PERFORMANCE OF SOUTH SWAN HILLS TERTIARY MISCIBLE FLOOD.** A review of the performance of the tertiary hydrocarbon miscible flood which has been operating in the West Waterflood area of the South Swan Hills unit since 1982 is presented. The production trend indicates that the tertiary flood has reversed the steady decline experienced under waterflood to the extent that the oil production has increased from 450 m<sup>3</sup>/day to as high as 1200 m<sup>3</sup>/day in 1986. The ultimate recovery factors for the project area are estimated at 38% original oil in place (OOIP) by waterflood and 59% OOIP by miscible flood. The projected 20% incremental recovery is based on a black oil model simulation and is in line with the incremental recovery predicted for the secondary miscible flood in the South Swan Hills Unit. (Edited author abstract) 4 refs.

**073198 CHEMICAL AND PHYSICAL APPLICATIONS IN TREATING PRODUCED-FLUID EMULSIONS OF THE BELL CREEK MICELLAR/POLYMER FLOOD.** Unforeseen chemical and physical treating problems arose in obtaining acceptable oil and water quality when produced micellar petroleum sulfonates created unique phase changes in the produced-fluid emulsion. Production facilities had to be modified continuously to adapt to the changing emulsion characteristics. Although the production facilities were adapted to meet the changing phase concentrations of the produced fluid, their undersized capacity would not allow the retention time necessary to break the oil and water emulsions effectively in the presence of sulfonates. Conventional reverse chemicals and demulsifiers proved ineffective in treating the produced-fluid emulsion. New chemicals had to be developed to treat the sulfonated production in an environment conducive to the undersized production facilities. (Author abstract) 8 refs.

**073199 PHASE BEHAVIOUR OF TERTIARY RECOVERY SULFONATES - PETROLEUM FRACTIONS - AQUEOUS SYSTEMS.** The phase behavior of tertiary recovery sulfonates having commercial names TRS-10, TRS-16 and TRS-40 with aqueous phase and light petroleum fractions (non polar kerosene and gasoline) was studied at 20, 40 & 60 degrees C. The adopted pseudo components of the ternary diagram are hydrocarbon, surfactant and aqueous phase. The aqueous phase was composed of bidistilled water in addition to different proportions of pure alcohols and sodium chloride. The tested alcohols included methanol, ethanol, iso-propanol, n-butanol and n-pentanol. It was shown that the higher the affinity of the tested surfactant for hydrocarbon phase, the greater is the solubility of the corresponding optimum co-surfactant in water. (Edited author abstract) 31 refs.

Ghoniem, S.A. (Kuwait Oil Co, Ahmadi, Kuwait); Darwish, T.A.; Salamah, A.O. *Erdoel Kohle Erdgas Petrochem* v 41 n 2 Feb 1988 p 74-80.

## Testing

**073200 OIL RECOVERY METHOD COULD NET MILLIONS OF DOLLARS FOR KANSAS.** The Tertiary Oil Recovery Project (TORP) at the University of Kansas uses a polymer gel to recover barrels of oil. As in water flooding, the polymer will follow the path of least resistance to the most permeable rock layers, the so-called

high-flow regions. Once the gel fills the formerly flooded route, water is introduced again. But now the water is diverted to untapped, oil-rich layers, and the booty can be forced to the surface. The polymer begins as powder mixed in a tank with water, 2000 parts per million. That causes the viscosity to go up, making the polymer thicker than molasses. To get the polymer chain to gel, chromium must be added to the mixture. This year, Kansas is producing 166,000 barrels a day. At 15 dollars a barrel, that's 2.5 million dollars a day - almost one billion dollars for the year.

**073202 COMPARISON OF K-VALUE CALCULATION METHODS IN COMPOSITIONAL STEAMFLOOD SIMULATION.** The speed and accuracy of compositional steamflood simulation were compared for four K-value calculation methods: the Antoine equation, table look-up, the Peng-Robinson equation of state (PR-EOS), and the Hong-Makhlouf modification of Wilson's equation. These methods were used with a compositional steamflood simulator to model light-oil steamfloods in three- and one-dimensional (3D and 1D) reservoir models. The results indicate that the table look-up and the Hong-Makhlouf modification of Wilson's equation are the most preferred methods to use in terms of both speed and accuracy of computation. This paper describes how the four methods are used in compositional steamflood simulation and discusses the advantages and disadvantages of each method. (Edited author abstract) 12 refs.

**073203 PILOT STEAM SOAK OPERATIONS IN DEEP WELLS IN CHINA.** Three fields with reservoirs at 1000 to 1300 m [3,281 to 4,265 ft] were almost nonproductive before, but generally a peak production of 100 to 200 Mg/d [100 to 200 tonnes/D] per well was obtained after steamsoak. This paper presents the results of optimization of the steam injection parameters by physical modeling and mathematical simulation studies, e.g., steam quality, injection rate, and amount of steam injected in each cycle. Field pilot tests show that steam injection is feasible in these oil fields under respective reservoir conditions. A feasibility study on the development project of the Gaosheng oil field shows that, for such a deep reservoir, steamdrive is feasible by well bore heat insulation techniques without downhole steam generators. (Edited author abstract)

**073204 EFFECTIVENESS OF SCREENING TESTS AS PREDICTIVE MODELS FOR STEAMFLOOD ADDITIVES.** The control of fluid mobility has become increasingly important to steamflood applications for oil recovery. Most of the EOR projects in the U.S. use steamflooding techniques. The efficiency of these projects is often reduced because such effects as gravity override

results in poor volumetric sweep through the reservoir. Additives can improve the efficiency of steamflooding, but screening tests must be performed for selection of the most effective additive for individual applications. As potential additives, nine commercially available sulfonate surfactants were tested with the high-temperature/high-pressure foamability (HTHPF) test procedure, and eight of these were tested with the mobility control (MC) procedure. (Edited author abstract) 23 refs.

**073205 COMPARISON OF STEAMFLOOD STRATEGIES: FIVE-SPOT PATTERN VS. INVERTED NINE-SPOT PATTERN.** This paper describes the use of a black-oil, thermal simulator to compare steamflow development using five-spot and inverted nine-spot patterns. The input data selected were representative of a homogeneous heavy-oil reservoir. This study considered three different development strategies: conventional pattern steamflooding, pattern steamflooding with infill drilling, and steamflooding with infill drilling and pattern realignment. Comparison of pattern steamfloods indicates that at close well spacing (1.25 acres/well [0.5 ha/well]), the inverted nine-spot recovers more oil than the five-spot. Steam breakthrough and oil production are accelerated for the nine-spot relative to the five-spot pattern. At larger well spacing, however, oil recovery from the five-spot pattern exceeds that from the nine-spot. (Edited author abstract) 27 refs.

**073206 EXAMINATION OF THE CONFINED-PATTERN CONCEPT IN STEAMFLOOD SIMULATION.** The confined-pattern concept has been widely used in steamflood simulation for homogeneous reservoirs with negligible dipping. This work found that, for field projects with 9 to 100 repeated patterns, this concept underestimates the actual oil production by 3% at the end of 6 years. The usefulness of the concept has thus been ensured. (Author abstract)

**073208 COMPUTERIZED ANALYSIS OF THERMAL RECOVERY WELL TEST DATA.** The thermal recovery of oil requires large investments of time and money. Well tests are a relatively easy way to monitor this expensive process until breakthrough occurs at producers, and they can be used to find the volume (but not the shape) of the swept zone. This paper discusses the application of automated type-curve match to such well tests. A comparison with the best of present methods, i.e., the pseudosteady-state method, shows that automated type-curve match proves to be better in the determination of swept zone radius when mobility ratio is not high or when multiple flow rates have occurred. The application of automated type-curve match to two field examples is demonstrated. (Author abstract) 14 refs.

**073209 MULTIBOREHOLE SEISMIC IMAGING**

**IN STEAM INJECTION HEAVY OIL RECOVERY PROJECTS.** Crosshole seismic measurements before and after steam injection were obtained for the purpose of delineating the fluid-invaded zone. The experiment, despite its limited temporal and spatial sampling, showed significant changes in seismic signature after steam injection. The seismic records of the 'before' and 'after' (steam flood) experiments were normalized by using the tube waves. Important results were obtained from power spectral studies which show significant changes after fluid injection. For higher resolution and increased constraints on the determination of the steam-invaded zone, a more sophisticated cross-hole experiment has been designed. Computer simulation of the proposed experiment has been carried out assuming an asymmetrical shape for the steam zone. Inversion via a tomographic approach by solution of an overdetermined system of linear equations produced reconstructions that were in good agreement with the assumed shape and P wave velocity of the steam zone. (Edited author abstract) 18 refs.

**073210 ROLE OF NONCONDENSABLE GAS IN STEAM FOAMS.** Field tests suggest that a steam-foam drive is more effective when nitrogen, methane, or the like is added to the formulation. A plausible explanation is that foam lifetime is longest when transport of noncondensable gas limits mass transfer between steam bubbles. On the basis of this hypothesis, a method to estimate the amount of noncondensable gas to be included is presented. (Author abstract) 27 refs.

**073211 THERMAL CRACKING (SOAKER-VISBREAKING) STUDIES ON QAIYARAH LONG RESIDUES.** Attempts have been made to upgrade Qaiyarah long residue using soaker-visbreaking process as a suitable method to get valuable products and more distillates. The operation was carried out in a continuous laboratory-scale unit at a range of mild condition. Physico-chemical properties of the visbroken products and their activation energy has been reported. The viscosity and pour point are reduced to about 80.5% and 75% by this process. Furthermore, data on the yield and the characteristics of different fractions has been obtained. Atmospheric and vacuum distillation of visbroken products show that about one sixth distilled of visbroken products are as middle distillate, leaving 58.6% on crude base, highly asphaltic material. (Author abstract) 7 refs.

**073212 GEOMETRICAL EFFECT OF STEAM INJECTION ON THE FORMATION OF EMULSIONS IN THE STEAM-ASSISTED GRAVITY DRAINAGE PROCESS.** The production from the in-situ thermal recovery of heavy oils always consists largely of water in oil emulsion. This is much more viscous than the oil itself. In this paper, the production of such emulsions has been studied in a laboratory-scaled reservoir model and it has been found that the degree of in situ emulsification can be changed by altering the geometry of the steam injection. (Edited author abstract) 11 refs.

**073213 RECENT OBSERVATIONS AT THE GOLDEN LAKE SPARKY FIREFLOOD PILOT.** The Husky operated Golden Lake Sparky fireflood pilot has been in operation since 1968, and the pilot history, field characteristics, and operating results through 1981 have been reported in the literature. During the following four years the pilot was expanded extensively. In 1982, two

additional patterns were ignited and, in 1983, seven wells were drilled to complete one additional pattern and parts of three others. In late 1984/early 1985, fifteen wells were added to complete four patterns, add five offsetting producers, and replace an abandoned well. In late 1985, ignitions were attempted at three of the newly completed patterns. This paper reports the events which occurred between 1981 and 1986 and broadened the understanding of the fireflood process in this reservoir. (Edited author abstract) 20 refs.

**073215 VISCOELASTIC SYSTEMS FOR CONTROLLING THE STREAM INJECTION DURING THERMOSHIFT WORKING.** The injection of a viscoelastic heat carrier in the late stage of thermoshift working of a field with inhomogeneous cracked collectors is a promising method of reducing the filtration of steam through flushed, worked-out zones and of directing it into sections with a high degree of residual oil saturation. The plugging of the filtration channels forming during the injection of steam in the initial stage of working increases the portion of the formation affected by displacement, i.e., the oil output in the late stage, and reduces the specific consumption of steam and the heat loss to the shaft atmosphere. The ability of a viscoelastic system to plug previously worked zones reduces sand development and water contamination of the oil, thus improving the well working conditions. In Russian. 2 refs.

**073216 ENERGY EXPENDITURES DURING THERMAL STIMULATION OF A FORMATION.** A comparative estimate is made of the energy expenditures related to the working of a formation thermally stimulated either by moist steam or hot water. It is shown that, when hot water is used as the heat-transfer agent, the quantity of it required, depending on its temperature, must be two to five times greater than the quantity of moist steam. Only under this condition is it possible to attain the same rates of introduction of heat into the formation with hot water with moist steam. Moreover, a corresponding quantity of fluid must be removed from the extraction wells, which is not always possible. In Russian. 5 refs.

Zlygostev, E.E. *Neft Khoz* n 1 Jan 1988 p 40-43.

**073217 STEAMFLOOD STRATEGIES FOR A STEEPLY DIPPING RESERVOIR.** A computer simulation study was conducted to determine the best steamflood strategy for a steeply dipping (20°[0.35-rads] reservoir. A compositional steamflood simulator was used with both two-dimensional (2D cross section) and three-dimensional (3D) models of the reservoir. The study showed that gravity drainage of the heated oil is the main production mechanism in steamflooding steeply dipping reservoirs. Consequently, oil production is strongly affected by injector and producer locations. The best steamflood

strategy for this type of reservoir, therefore, involves judicious selection of injector and producer locations, reducing steam injection rate and shutting in wells selectively at appropriate times, and injecting a noncondensable gas to prevent steam cycling in the depleted updip portion of the reservoir. (Edited author abstract) 7 refs.

**073219 WAYS OF INCREASING THE OIL OUTPUT OF CARBONACEOUS COLLECTORS SATURATED WITH HIGH-VISCOSITY OIL.** The optimal formation heating temperature during the working of a Permian-Carbonaceous deposit in the USA field by thermal methods amounts to about 200°C. Uniform heating to this temperature makes it possible to increase the oil output to 30-40%. The high oil output of the formation is related to the generation of a large quantity of gas at the contact between the oil and the oil-containing rock of the Permian-Carbonaceous deposit. In Russian.

**073220 COMPREHENSIVE SIMULATION STUDY OF STEAMFLOODING LIGHT-OIL RESERVOIRS AFTER WATERFLOOD.** Steamflooding, the most successful among enhanced recovery methods, has been applied mainly to heavy-oil reservoirs. This paper presents a comprehensive simulation study on the use of steamflooding after waterflood in light-oil reservoirs. Some important observations are made on this new application of the process. Guidelines are developed not only for selecting reservoir candidates for steamflooding, but also for designing and operating steamfloods in watered-out reservoirs. Relative importance of key mechanisms to oil recovery is also discussed. (Author abstract) 6 refs.

Waste Disposal

**073221 DEVELOPMENT STUDY OF A CENTRIFUGING TECHNIQUE FOR OILFIELD PRODUCTION PIT CLOSURE.** A study was performed of a centrifuge-based process for dewatering oilfield production waste sludges in order to investigate an application of the process an oilfield production pit closure. The two-stage process tested was primary solids removal by centrifugal classification followed by chemical conditioning and dewatering. Also, tests were run to understand the effects of the fundamental centrifuging parameters (the bowl-scroll differential speed and the centrifugal force) on the composition and quality of the dewatering products. The concentration of metals in the production pit sludge before and after dewatering was analyzed in terms of environmental regulations. The removal of heavy metals from the centrifuge overflow was also evaluated. (Edited author abstract) 13 refs.

Well Testing

**073222 WELL TEST ANALYSIS FOR SOLUTION-GAS-DRIVE RESERVOIRS: PART I - DETERMINATION OF RELATIVE AND ABSOLUTE PERMEABILITIES.** This note investigates the transient pressure response at a well draining a solution-gas-drive reservoir. It is shown that estimates of effective permeabilities (absolute permeability times relative permeability) can be obtained directly from the measured flowing wellbore pressure and the flow rates. It is then possible to compute the oil saturation at the wellbore as a function of time, or, as a function of pressure, by solving a simple ordinary differential equation presented in this work. Since the method yields both oil saturation and effective permeabilities as a function of pressure, one also obtains effective permeabilities as a function of oil saturation. (Edited author abstract) 22 refs.

OIL WELL PUMPING

**073223 ACTIVATION DES PUITES: CRITERES DE SELECTION DES PROCEDES.** [Activation of Wells: Criteria for Process Selection]. There are four main methods for the downhole pumping of crude oil that involve the transfer of the necessary power from the surface to downhole: mechanical, electric, pneumatic, hydraulic. The field equipment raises a difficult problem of choosing among these processes and their different variants. This article first makes a review analysis of techniques now used in this area. It then describes a general method for selecting processes with a view to optimizing equipment. This method is based on an expert system and a model for computing energy efficiencies and cost prices. An example of computing results can be used to make a quantitative comparison of the leading processes. (Edited author abstract) In French. 21 refs.

Design

**073224 CALCULATOR PROGRAM SPEEDS PUMPING UNIT DESIGN.** The program described in this article calculates rod string factors and pumping unit loads in accordance with procedures outlined in API Recommended Practice for Design Calculations for Sucker Rod Systems, API RP11L using the TI-59. The program requires the use of a printer for input prompts and output labels. It can be modified for handheld operation using register numbers. Two programs are actually required due to calculator capacity. Each program requires two cards and a third card for alphanumeric memory. The first program requires input of the basic well data and prints out the non-dimensional variables required for entry to Figures 4.1 through 4.6 of API RP11L (or Lufkin Tables 3 through 7). Program 2 transfers the data from Program 1 to the first eight registers of Program 2, prompts for Register 8, 1/KT and indicates the value calculated by Program 1 in the machine register.

Equipment

**073225 PUMPING UP FROM DOWN.** As offshore oil fields become depleted and many new marginal fields have insufficient natural drive to force oil to the surface, artificial lift is being used more extensively. This article reviews important developments which are taking place to improve the effectiveness of subsea downhole pumps.

Anon. *Mar Eng Rev* Apr 1988 p 19, 21.

**073226 WEIGH ADVANTAGES OF FIBERGLASS SUCKER RODS.** Fiberglass rods are subjected to high cyclic stress ranges; that is, wide variation between

minimum and maximum loads. Because of this, their useful life is limited by the fatigue properties of the pultruded composite. For the most highly stressed rods near the top of the string, manufacturers project useful life of about 17 million cycles. For a highly stressed rod string in a typical beam-pumped well, this translates into a useful life of 4 or 5 years. Properly designed fiberglass rods can allow more production from an underproduced well using the same surface equipment. The lighter rod string may allow more strokes per minute, or a larger pump to be installed. In some cases, the same surface stroke has resulted in a much longer effective pump stroke, which increases fluid lifted with no other changes in pumping parameters. API Spec 11C provides quality control and dimensional requirements for manufacture of fiberglass sucker rods. Materials and performance must be qualified by testing as specified in Spec 11C.

Measurements

**073228 DETERMINATION OF CHARACTERISTICS OF WELL BOTTOM ZONE FROM DATA ON CHANGES IN ITS OPERATING CONDITIONS.** A method of determination of the physical parameters of the well bottom zone is presented. It is characterized by a high operational flexibility and is based on the data regarding the changes in the operating conditions of the pumping well, obtained by taking a measurement of the dynamic level in the space outside the pipe by a wavemeter. The method proposed makes it possible to determine the indicated parameters from a comparatively small number of initial data and does not require the lifting of internal well equipment. **Acid Treatment** See Also OIL FIELDS—Field Development; OIL WELL PRODUCTION—Flooding.

**073230 HEATED ACIDS FOR IMPROVED STIMULATION.** A simple and practical process has been developed to heat hydrochloric acid to improve its performance as an oil well stimulating agent. Heated acid is used in cold formations such as cold dolomites to

increase the rate at which the formation is dissolved, thus improving flow capacities. The technique heats the acid by causing an exothermic chemical reaction that uses a portion of the HCl as one of the reactants. Heated acid reacts at a faster rate and aids in the removal of acid-retarding materials such as oil, asphaltene and paraffins to give a better acid-to-formation contact. Laboratory and field results illustrate the effectiveness of the heated acid method of stimulation and compare the various methods of bringing the acid to its ideal temperature. (Edited author abstract) 4 refs.

**073231 FOAM-DIVERTING TECHNIQUE IMPROVED SANDSTONE ACID JOBS.** Advantages and disadvantages of foam diverting as well as treatment design procedures for foam diverting in matrix hydrofluoric acid treatments are presented in this article. It is shown that foam diverted matrix hydrofluoric acid treatments have been successful in removing inorganic damage. Staged 65 quality foam treatments have been used most often in this work with encouraging results. The specific foam diversion technique used in a treatment design is dependent on individual well characteristics as well as the stimulation objective. Proper planning of a tailored Gulf Coast sandstone stimulation job should include mineralogical analysis of core material to aid in selecting proper acids, along with produced fluid testing to minimize paraffin, asphaltene and emulsion problems during and after the work. 11 refs.

**073235 STATUS REPORT: ACID FRACTURING.** The basic principles and objectives of acid fracturing are the same as for propped fracturing treatments. In both cases, the goal is to produce a conductive fracture with

sufficient length to allow more effective drainage of the reservoir. The major barrier to effective fracture penetration by acid is apparently excessive fluid loss. Fluid-loss control is a greater problem with acid systems due to the constant erosion of fracture faces. Various additives and treating techniques have been developed to control acid fluid loss. Among the earliest were natural materials, such as gum karaya. Multiple stages of viscous pad have been used to control acid fluid loss. In this technique, the fracture is initially created by a gelled pad, after which alternating stages of acid and additional pad are pumped. These additional pad stages are designed to enter and seal wormholes created by the preceding acid. Fine particulate material often is added to the pad stages to aid in fluid-loss control. Acid loss can also be reduced by acid gelling. Surfactant-type thickeners are also used. However, acid forming is one of the most effective methods to control acid loss. A discussion is presented of techniques to control acid reaction rate. 4 refs.

**073236 STATIC AND DYNAMIC THREE-DIMENSIONAL BOTTOMHOLE ASSEMBLY COMPUTER MODELS.** This paper presents two three-dimensional (3D) mathematical models to predict the directional behavior of bottomhole assemblies (BHA's). The first model describes BHA dynamic, stepwise, transient behavior. Displacements and lateral forces, computed for each step, account for friction against the borehole wall. The second model computes a static BHA equilibrium whereby simplified friction forces are assumed. The static lateral forces are found to be an average of the highly varying ones computed by the dynamic model, but the static computer run is much faster. The static model is therefore used iteratively to compute an oriented dogleg severity that balances lateral forces. This is used to derive the directional behavior of the BHA. Comparison and calibration against real field cases are performed. (Author abstract) 11 refs.

**073238 STUDY OF MULTIPHASE FLOW BEHAVIOR IN VERTICAL WELLS.** This paper presents a physical model for predicting flow pattern, void fraction, and pressure drop during multiphase flow in vertical wells. The hydrodynamic conditions giving rise to various flow patterns are first analyzed. The method for predicting void fraction and pressure drop is then developed. In the development of the equations for pressure gradient, the contribution of the static head, frictional loss, and kinetic energy loss are examined. Laboratory data from various sources show excellent agreement with the model. (Author abstract) 45 refs.

## Control

**073239 TREE SNUBBING OPERATION SOLVES WELL CONTROL PROBLEM.** A unique method is discussed for removing a Christmas tree under high pressure and install BOPs without a rig. This allowed workover of a gas-condensate well with a shallow tubing break that could not be killed by surface pumping due to casing pressure limitations. The tree-stripping procedure is applicable to wells with Christmas trees that are screwed to the tubing string and equipped with wrap-around tubing hangers. (The method would not be required if the tree were provided with a mandrel hanger that could receive a back-pressure valve). The four steps that should be performed prior to any tree removal operation are outlined.

**073240 CONTROLLING CORROSION IN DEEP HOT WELLS.** This article makes a broad economic comparison of several of the more common means of completing deep corrosive wells. The five cases presented are for three alloy completions and two continuous inhibition completions. By using the best available data on the cost of corrosive well completions, the economic advantage of one completion method over another - with all else being equal - is a function of the well depth and the discount rate. At high discount rates over the entire depth range, capillary tube injection is favored economically over all CRAs (Corrosion Resistant Alloys) except for 13% Cr. As the discount rate decreases, CRAs are generally more economical than chemically inhibiting steel tubing, except for shallow wells. Annular injection is less economical than CTI (Capillary Tube Injection) under the assumptions used in this study. 10 refs.

## Corrosion Protection

**073241 PHASE DIAGRAMS CAN LOCATE GAS-CONDENSATE-WELL CORROSION.** Phase diagrams that show regions where different phase combinations are in equilibrium help answer many questions in a gas-condensate well void of formation water. Typical questions might be: Is there only the vapor phase present or is there really a condensed water-rich liquid in equilibrium with the vapor phase? Are there really two condensed liquid phases in equilibrium with the vapor phase, both a water-rich liquid and a hydrocarbon-rich liquid? If an inhibitor is added, will the inhibitor cause a new hydrocarbon-rich liquid to appear or does it alter the hydrocarbon-rich liquid already present? The phase diagram regions are shown as functions of temperature and pressure; hence, the pressure-temperature profile of the well can be added to the associated phase diagram to see what phase combinations are possible throughout the well string. Deductions can then be made to determine where corrosion problems are likely to occur and what actions are possible to reduce corrosion. (Author abstract) 3 refs.

**073243 NEW SAND-CONTROL FILTER FOR THERMAL RECOVERY WELLS.** A device was designed to solve a severe case of sand inflow into horizontal wells at the Athabasca Tar Sands pilot plant in Fort McMurray, Alberta. The sand problem at this pilot resulted from a combination of three conditions: a fine-grained, cohesionless sand; the cyclic injection of steam; and the production of steam, water, and high-viscosity bitumen. A new type of filter, designed to overcome this problem, has application to the control of solids in wells drilled in a variety of formations producing liquids or gas. It was first designed and tested in the laboratory with a physical simulator; then it was fabricated and tested in vertical wells at the Athabasca pilot plant. (Author abstract) 11 refs.

**073244 ANALYTICAL SOLUTIONS FOR VERTICAL FRACTURE IN A COMPOSITE SYSTEM.** A method is proposed to interpret the pressure transient data of injection wells in secondary and tertiary recovery processes. A composite system is considered in which the inner region represents a swept volume and the outer region extends to infinity. The two regions are thus featured by different hydraulic diffusivities and mobilities. The well is vertically fractured and the fracture is assumed to exhibit an infinitely large conductivity. The flow behavior in the system is described by use of elliptical geometry. The model was tested against several cases for which analytical solutions are available and good matches were obtained. (Author abstract) 10 refs.

**073245 HOW TO ENGINEER A FRACTURING TREATMENT.** The author considers the elements that can contribute to a successful hydraulic-fracture-treating program. Not all the elements need to be done in every case. However, they should be considered carefully, because they might affect both the success and the interpretation of the fracture simulation treatment. Inade-

quate evaluation could fail to identify changes and improvements to include in subsequent treatments. A discussion is presented that covers the pretreatment, execution, and evaluation phases of hydraulics fracturing. The key phase in fracture design is the pretreatment analysis. 12 refs.

**073246 MODEL INVESTIGATION OF WELLBORE PRESSURE DISTRIBUTION IN STEM-INDUCED FRACTURING.** This paper describes model testing conducted to investigate pressure variations along the length of a wellbore between a decoupled bottom charge and the stem. Tests were conducted in three-dimensional models made from thick plexiglass sheets that contained small decoupled explosive charges in the bottom of the borehole. Charge sizes varied from 75 to 200 mg, and the open borehole length between the top of the charge and the stem ranged from three to seven times the charge length. Both top and bottom charge initiations were investigated. Multiple pressure transducers were used along the borehole, and pressure/time distributions were determined at several locations. (Edited author abstract) 5 refs.

**073247 FRACTURE GEOMETRY AND PROPPANT-TRANSPORT COMPUTATION FOR MULTIPLE-FLUID TREATMENT.** This paper incorporates expressions for changing the flow-behavior index,  $n'$ , and the flow-consistency index,  $K'$ , of fracturing fluids used in any treatment into a dynamic procedure for fracture design to determine simultaneously the temperature profile, viscosity profile, location of each fluid, and location of each proppant in the fracture, together with the resulting geometry. After pumping ceases, the effect of temperature recovery on proppant deposition and fracture closure is also considered. Several examples demonstrate the effective use of this new procedure for better fracture design. These examples will show the effect of temperature on fluid behavior and its influence on proppant deposition in the fracture. (Author abstract) 7 refs.

**073248 ANALYSIS OF FRACTURED WELLS PRODUCING AT HIGH FLOW RATES USING LATE-TIME DATA.** This paper presents a method for analyzing late-time data for high-flow-rate wells that cause turbulent flow within the fracture. Fracture conductivity has been determined on the basis of early-time pressure data. The pseudoradial flow period, however, can be used to check the fracture conductivity by identifying the semilog straight line and by determining the total skin factor. We have found that early-time correlations cannot be used to correct apparent fracture conductivities obtained in the late-time analysis. This is because the flow regime has changed significantly between the early and late periods. Examples are presented that use either both early- and late-time data or only late-time data for determining the true fracture conductivity. (Edited author abstract) 8 refs.

**073249 PRESSURE FALLOFF BEHAVIOR IN VERTICALLY FRACTURED WELLS: NON-NEWTONIAN POWER-LAW FLUIDS.** This paper examines pressure falloff behavior in fractured wells after the injection of a non-Newtonian power-law fluid. Results are presented in a form suitable for field application. Responses at wells intercepting infinite-conductivity and uniform-flux fractures are considered. Procedures to identify flow regimes are discussed. We also examine responses at unfractured wells. This part of our study examines the validity of using the superposition principle to analyze pressure falloff data. (The pressure distribution

for this problem is governed by a nonlinear partial-differential equation.) If the solutions given in the literature are used, then correction factors are needed to analyze pressure falloff data. The results of this phase of our work can also be used to analyze data in fractured wells provided that pseudoradial flow conditions exist. (Edited author abstract) 38 refs.

**073250 PRACTICAL APPLICATION OF ECONOMIC WELL-PERFORMANCE CRITERIA TO THE OPTIMIZATION OF FRACTURING TREATMENT DESIGN.** Computerized models of varying complexity have become available that use net-present-value (NPV) calculations. The input is based on the operator's performance goals for each well and on specific reservoir properties. Simpler, noncomputerized approaches also being used include cost performance comparisons and nomographs. Each type of model, including several of the computerized models, will be examined. By use of these models and NPV calculations, optimum fracturing treatment designs have been developed for such low permeability reservoirs as the Prue in Oklahoma. Typical well conditions are used in each of the selection models and the results are compared. (Edited author abstract) 15 refs.

**073252 ANALYSIS OF IN-SITU FRACTURE OF OIL SAND FORMATIONS BY EXPLOSIVES.** An analytical model is proposed for the design and simulation of in-situ fracture of deep oil sand formations. This model is based on the finite element variational principle in conjunction with special empirical modules to characterize in-situ oil sands behavior. A computer code by the name of SANFRAC was developed to handle the dynamic fracture of formations induced by explosives. Simulation of hydraulic fracture processes can be treated by the same code as special cases using the quasi-static analysis. Numerical case studies by the SANFRAC code indicate that extensive horizontal fracture can be achieved by dynamic loads with proper fracture starters configured at the injection well. The unique advantage of the dynamic fracturing technique over the hydraulic fracture methods is also demonstrated by these studies. (Author abstract) 14 refs.

**073253 SIMULATIONS OF NATURALLY FRACTURED RESERVOIRS.** A three-dimensional (3D), three-phase, black-oil model is described which is being used to simulate naturally fractured reservoirs. The program is fully implicit and can perform single-porosity, dual-porosity or dual-permeability computations. Sample simulations are presented to illustrate the differences between the three computational techniques. Single-porosity recoveries are much larger than the recoveries predicted by the dual techniques. The dual-permeability,

primary-depletion recoveries are very similar to the dual-porosity, primary-depletion recoveries, while the dual-permeability waterflood recoveries are significantly larger than the dual-porosity waterflood recoveries. (Edited author abstract) 22 refs.

**073254 DISPERSION OF A SOLVENT SLUG INJECTED INTO A COMMUNICATION PATH.** Solvents may be injected into a formation once communication has been achieved between injection and production wells to increase the size of the communication path. However, the solvent disperses into the formation and bitumen flows into the communication path, increasing the viscosity of the flowing phase. As a result, no solvent may ever appear at the producing well. In this paper, the problem is modeled for the one-dimensional case and an analytic solution is obtained from which breakthrough time, outlet concentration of solvent, and other significant parameters can be estimated. **073255 DIESEL-BASED HPG CONCENTRATE IS PRODUCT OF EVOLUTION.** Use of a diesel-based, hydroxypropyl guar (HPG) concentrate as a means of creating aqueous fracturing fluid for operations in the Laredo, Tex., area has evolved from the batch-mixed dry powder type, through water-based gel concentrates (800 lb gel/Mgal) to diesel-based (6,600 lb gel/Mgal) HPG. Conversion to a diesel-based gel concentrate has reduced the concentrate requirement by a factor of six. A job that required 20,000 gal of water-based gel concentrate and a 500-bbl frac storage tank can now be run out of one 4,000 gal transport of diesel-based concentrate. Field results are given for three Wilcox jobs. 3 refs.

**073257 CONTINUOUS MIX TECHNOLOGY ADDS NEW FLEXIBILITY TO FRAC JOBS.** After years of trying, continuous mix technology appears to be a practical method for obtaining better frac jobs. It provides the capability to modify fluid characteristics during a treatment in response to reservoir conditions. For instance, fluid viscosity can be raised or lowered to accommodate apparent viscosity increases caused by proppant and rapid changes in proppant. Polymer concentration can be adjusted in response to downhole pressure changes. This flexibility economizes materials and increases the control over the job. The article discusses the Dowell Schlumberger Inc. development of technology to permit continuous mixing of fracturing fluids. 7 refs.

**073258 L'OUVERTURE DES TROUS DE FORAGES: SYNTHÈSE BIBLIOGRAPHIQUE.** [Borehole Breakout: Bibliographic Synthesis]. Natural borehole breakout (borehole cross-section elongation) due to the fracturing and spalling of well walls has been used in

recent years to determine the direction of stress in the Earth's crust. Its performances and scope of application are compared to those of other methods used in boreholes. An initial selection of information obtained by different logging tools appeared necessary to prevent any contamination of measurements by phenomena independent of deformation under stress. The principal parameters governing the amplitude and frequency of the phenomenon are reviewed. The outlook for the future of the method is examined, including the recent development of research on borehole breakout by the plastic deformation of the surrounding formations. (Author abstract) In French. 51 refs.

**073259 DISPERSION RADIAL DE TRAZADORES MISCIBLES EN MEDIOS POROSOS FRACTURADOS.** [Radial Dispersion of Miscible Tracers Within Fractured Porous Media]. An analytical solution to the problem of radial displacement of a miscible tracer within a fractured porous medium is presented. It is shown that, within the fracture, the displacement by convection is much more important than the displacement by diffusion, so that the latter process is negligible. Furthermore, the matrix blocks serve as storage elements which exchange fluids with the fractures by a diffusion process. To illustrate the results obtained, graphs of effluent concentration as a function of injected fluid volume are presented. (Edited author abstract) In Spanish. 10 refs.

**073260 FRACTURE-GRADIENT PREDICTION FOR OFFSHORE WELLS.** A key parameter required in the design of offshore wells is the fracture gradient of the formations to be penetrated. Existing fracture-gradient correlations have been developed largely on the basis of empirical data gathered on land and in the near-shore marine environment. They have been extended to deepwater areas through an equivalent intergranular stress concept. In this study, offshore data from several operators were obtained and a new fracture-gradient correlation procedure, based on an assumption of an exponential decline in average porosity with depth in normally pressured formations, was applied. The technique is ideally suited for implementation on a hand-held calculator or personal computer. (Author abstract). 5 refs.

Constant, W. David (Louisiana State Univ, USA); Bourgoynne, A.T. Jr. *SPE Drill Eng* v 3 n 2 Jun 1988 p 136-140.

**073261 FRACTURE HEIGHT PREDICTION.** A currently used, simple procedure includes (1) compressional and shear wave velocities from a long-spaced sonic or sonic digital tool to calculate rock elastic properties; (2) a transversely isotropic elastic model to compute minimum horizontal stress using elastic properties and pore pressures; and (3) a linear fracture mechanics model using minimum horizontal stresses to predict fracture height growth. Each of these steps is briefly described. It is shown that continuous sonic logging data, using long-spaced sonic or digital sonic tools, combined with mini- or microfracture data and linear fracture mechanics can allow one to determine the required fracture height parameter. 22 Refs.

Ahmed, Usman (Schlumberger Well Services). *JPT J Pet Technol* v 40 n 7 Jun 1988 p 813-815.

**073262 HOW TO CALCULATE FRACTURE PRESSURES FROM WELL LOGS.** This work improves on the vertical fracturing model and field solution discussed by R.A. Anderson, D.S. Ingram, and A.M. Zanier. They used an empirical method to solve their fracture-pressure equation, and they elected not to consider the tensile strengths of different sands. In the improved procedure discussed in this paper, tensile strength is considered and a theoretical approach is used to evaluate the different factors in this fracture-pressure equation. The problem of

matching physical properties of new sands to the properties of test sands can be avoided. This is accomplished by making the three improvements proposed to the calculation procedure. The improvements are the vertical grain pressure is corrected for tectonic pressure to become the effective vertical grain pressure. Examples of tectonic pressure include salt dome intrusion, folds, faults, or plate movement. Tensile strength is added to the right side of one equation. This strength must be overcome before a fracture could be initiated unless open fractures already exist. It is shown that the maximum estimated fracture pressure corresponds to including tensile strength in the fracture pressure equation; the minimum corresponds to excluding the tensile strength. The average error of all the estimates from reported corresponding minimum and maximum fracture pressures is about 5%; the maximum error is about 11%. 9 Refs.

**073263 LIQUID CO<sub>2</sub> FRACTURING: ADVANTAGES AND LIMITATIONS.** The concept of fracturing with 100% CO<sub>2</sub> as the sole carrying fluid was first introduced in 1981. Development of this process was an extension of comingling CO<sub>2</sub> with conventional treatment to aid in the recovery of load fluids. Well stimulation with CO<sub>2</sub> has since increased. Knowledge about its advantages and limitations has been acquired from completing over 450 liquid CO<sub>2</sub> hydraulic fracturing treatments. Results from various fields are assessed to demonstrate the success of the liquid CO<sub>2</sub> fracturing process. (Edited author abstract) 12 refs.

Sinal, Mary Lou (Canadian Fracmaster Ltd); Lancaster, Greg. *J Can Pet Technol* v 26 n 5 Sep-Oct 1987 p 26-30.

**073264 NUMERICAL SIMULATION OF HYDRAULIC FRACTURING TREATMENTS WITH LOW-VISCOSITY FLUIDS.** Field experience indicates that some fluids of this type (e.g., liquid CO<sub>2</sub>) may be preferable in sensitive reservoirs where there is a risk of formation damage with conventional treatments. Simulation of the process, which is characterized by low viscosity and temperature effects on fluid PVT, requires consideration of turbulence and its effect on fracture geometry, leak-off, and proppant transport. The model for low-viscosity fluids described was successfully used to match CO<sub>2</sub> field data with short closure times. Simulation results indicate effective propping of the fracture. (Edited author abstract) 22 refs.

**073266 HYDROXYPROPYLATION OF GUAR GUM AND THE EFFECT OF VARIOUS PROCESS PARAMETERS ON THE YIELD AND QUALITY OF HYDROXYPROPYL GUAR GUM.** Unmodified guar gum was used in the past as a fracturing fluid. However, upon degradation, it leaves behind about 15-20 percent insoluble residue which can cause considerable damage to the formation productivity. To overcome this shortcoming the guar gum can be modified to hydroxypropyl guar gum, which has a higher viscosity, better compatibility with electrolyte solutions and, on degradation, the insoluble residue is reduced substantially (approx. 4 percent). The authors report on the hydroxypropylation of guar gum using propylene oxide in an alkaline medium. 2-Propanol was used for the dispersion of the reactants. The reaction conditions were optimized. 6 Refs.

**073268 TEMPERATURE ANALYSIS IN HYDRAULIC FRACTURING.** The authors present a thermal analysis of hydraulic fracturing based on variational methods. The purpose is to provide a theoretical method for determining fracturing fluid temperature as a function of time and location during fracture growth. We first develop an expression of the variational principle for the general problem of convective heat transfer in a porous solid. Its accuracy is confirmed by comparisons with exact relations for specific cases. It is then used to develop a partial-differential equation for fluid temperature as a function of time and location. In this development, we treat fracture dimensions and leakoff distributions as known functions. The differential equation is solved by the method of characteristics. An alternative method of successive approximations is also presented. (Edited author abstract) 10 refs.

**073269 LIMITED ENTRY EXTENDED TO MASSIVE HYDRAULIC FRACTURING.** Limited entry techniques have recently been applied in massive hydraulic fracturing (MHF) of the Niobrara/Codell intervals of the Denver-Julesburg basin. Erratic surface treating pressure behavior and partial-to-complete well screenouts were frequently encountered during simultaneous treatment of these zones. This may be indicative of a lack of control of interzonal treatment fluid placement. There are field-proven solutions to this problem of interzonal fluid entry control during limited entry MHF. This first of two articles examines the downhole interactions that occur. The second will present field-proven solutions to the problem of interzonal fluid entry control during MHF. 31 refs.

**073272 PRINCIPLES FOR FRACTURE DESIGN BASED ON PRESSURE ANALYSIS.** This paper reviews the procedures for interpreting, modeling, and predicting fracturing pressure. This review shows that excessive pressure resulting from fluid flow in the fracture can cause such problems as excessive height growth and screenouts, which reduce the potential fracture penetration. As a result, an important design consideration is to limit the pressure by controlling the fluid viscosity. (Author abstract) 34 refs.

Nolte, K.G. (Amoco Production Co). *SPE Prod Eng v 3 n 1 Feb 1988 SPE 10911 p 22-30.*

**073273 APPLICATION OF FRACTURE DESIGN BASED ON PRESSURE ANALYSIS.** This paper describes case studies of fracturing pressure analysis for the Wattenberg field of the Denver basin and the Cotton Valley sand of east Texas. The studies show the benefits of pressure analysis and controlled pressure designs for fracture treatments. In addition, procedures for measuring fracturing pressures and considerations for the successful execution of minimal viscosity treatments are presented. (Author abstract) 31 refs.

Nolte, K.G. (Amoco Production Co). *SPE Prod Eng v 3 n 1 Feb 1988 SPE 13393 p 31-42.*

**073274 INFLUENCE OF DOWNHOLE CONDITIONS ON THE LEAKOFF PROPERTIES OF FRACTURING FLUIDS.** Fluid loss under dynamic conditions, considering such realistic conditions as low-permeability core samples and extreme shear conditions, has been examined and is reported in this paper. Dynamic data of fluid loss as a function of time, pressure, and temperature have been developed. Laboratory data are presented that describe the effects of shear rate, pressure differential, temperature, and time on the leakoff profiles of complexed gels. The relative effectiveness of fluid-loss additives, such as diesel and silica flour, is also presented. A comparison is made to other dynamically obtained leakoff velocities, as well as static data. Although dynamic data have been available, they have not been applied in field fracture design. In this work, a method of converting dynamic data to an effective  $C_w$  that can be entered into today's fracture simulators is proposed and examples are given. 16 refs.

**073275 HYDRAULIC-FRACTURE-TREATMENT DESIGN SIMULATION.** Computer simulation of hydraulic-fracture-treatment design uses a combination of reservoir rock, fluid properties, and process variables to compute the treatment size and volume on the basis of desired fracture geometry and conductivities. 2D, pseudo-3D, and even fully 3D fracture propagation simulators are now in use to simulate fracture geometry while many of the complex phenomena are considered (e.g., fracture

growth and containment) in the fracturing process. Depending on the complexities of the process, the underlying assumptions and the methodology of solution vary considerably from model to model. A fully 3D fracture propagation model requires much detailed information about material properties of the reservoir rock and the flow behavior of the fracturing fluids. 10 refs.

**073276 PRESSURE-TRANSIENT ANALYSIS FOR FRACTURED WELLS PRODUCING AT CONSTANT PRESSURE.** Past solutions to many well-test problems considered the wells to be produced at a constant rate. It has become apparent that there are many cases in which constant-pressure production is more common. Gas wells, geothermal wells, and even oil wells are operated at constant pressure during most of their producing life. This paper presents for the first time a technique that analyzes buildup and drawdown data from wells produced at constant pressure with turbulent flow in the fracture. Two example applications, one for buildup and one for drawdown, are included to demonstrate the use of these techniques. (Edited author abstract) 12 refs.

**073277 FRACTURE CONDUCTIVITY IN HYDRAULIC FRACTURE STIMULATION.** It is shown that proppant-pack conductivity determines the productivity improvement obtained by a hydraulic fracture stimulation treatment. Fracturing-fluid residue may reduce the proppant conductivity by 90% or more, depending on the fracturing-fluid type, quality and effectiveness, particularly of the breaker system. The non-Darcy flow factor increases with damage, thereby reducing the effective gas-well fracture conductivity further. Two-phase flow effects also reduce the effective fracture conductivity significantly. Fracture design, optimization, and proppant/fracturing-fluid selection account for all these factors. In particular, consider wide propped fractures resulting from the use of high proppant concentrations in the fracturing slurry; intermediate- or high-strength, coarse proppant in (relatively) shallow wells to replace the traditional 20/40-mesh sand economically; and fracturing fluids with low damaging characteristics together with an effective (on-site) quality-control program. 8 refs.

**073278 ABNORMAL TREATING PRESSURES IN MASSIVE HYDRAULIC FRACTURING TREATMENTS.** Abnormal treating pressures were observed during massive hydraulic fracturing (MHF) treatments in the Mesa Verde formation of the Piceance basin, CO. Data from three widely separated wells and in several zones per well showed a pressure increase during MHF treatments that we call 'pressure growth.' This pressure growth was at least semipermanent. The elevated instantaneous shut-in pressures (ISIP's) did not return to initial values over periods of several days. Pressure growth seems to depend on both pumping rate and fluid viscosity. Thus, there is some hope for its mitigation through treatment design. Also, pressure growth appears to correlate negatively with pay-zone quality. This suggests that the phenomenon can be exploited as a fluid-diversion technique. (Edited author abstract) 18 refs.

**073279 PRESSURE DISTRIBUTION IN THREE-DIMENSIONAL HYDRAULIC FRACTURES.** Stress intensity factors, calculated along the edge of an elliptic fracture with a three-dimensional (3D) coupled hydraulic fracturing model, differ significantly from those that arise from a uniform pressure within

the fracture. Interactions between the two branches of a T-shaped fracture are shown to affect the geometry of the overall fracture. Results of 3D model simulations are compared with field and experimental data. (Edited author abstract) 26 refs.

**073280 USE OF LONG-PERIOD SEISMOMETERS TO DETERMINE INDUCED FRACTURE GEOMETRY.** A novel technique to determine the geometry of induced hydraulic fractures has been tried at five shallow (305- to 884-m [1,000- to 2,900-ft] depth) stimulation tests since 1983. Long-period (LP) seismometers with peak ground-motion sensitivities in the period range between 10 and 100 seconds were deployed on the surface at distances 115 to 732 m [377 to 2,402 ft] from the treatment wellbores. Identifiable transient waveforms with reproducible site-specific ground-motion polarizations were recorded during four of the five stimulations. Temporal coincidence of these LP waveforms with treatment-related events [e.g., bottomhole pressure (BHP) passing through the formation closure stress] suggested that the signals may contain useful information about the induced fracture. (Edited author abstract) 27 refs.

**073281 MINIMIZING DAMAGE TO A PROPPED FRACTURE BY CONTROLLED FLOWBACK PROCEDURES.** Severe fracture-conductivity damage can result from proppant crushing and/or proppant flowback into the wellbore. Such damage is often concentrated near the wellbore and can directly affect postfracture performance. Most of the time severe fracture-conductivity damage can be minimized by choosing the correct type of proppant for a particular well. In many cases, however, this is not enough. To minimize excessive crushing or to prevent proppant flowback, it is also necessary to control carefully the flowback of the well after the treatment. Specific procedures can be followed to minimize severe fracture-conductivity damage. These procedures involve controlling the rates at which load fluids are recovered and maximizing backpressure against the formation. These procedures require much more time and effort than is normally spent on postfracture cleanup; however, the efforts could result in better performance. (Author abstract). 16 Refs.

**073282 HUGOTON INFILL PROGRAM USES OPTIMUM STIMULATION TECHNIQUE.** The Mesa Limited Partnership has evaluated its 1987 Kansas Hugoton field infill drilling program to determine the most efficient completion methods for the field. The focus was mainly on optimum stimulation techniques. Of several hydraulic fracturing methods tested, one proved to be the most effective. The results are being incorporated in the company's 1988 infill drilling program. Mesa has 327 existing wells in the Kansas Hugoton and has the opportunity to drill 326 infill wells. Fifty-six of the 66 infill wells completed by the end of 1987 are included in this study. Mesa expects to recover an additional 200 bcf of reserves as a result of the infill drilling program. 5 Refs.

**073283 FINITE ELEMENT APPROACH OF THE HYDRAULIC FRACTURING TECHNIQUE FOR OIL WELL STIMULATION.** This paper covers the application of the finite element method for stress analysis considering adequate boundary conditions for simulation of underground excavations in an infinite medium, by the application of special elements. The stress distribution analysis is actually the simulator of the effect of well boring taking into account the fluid pressure inside the

rock mass when a penetrating fluid is considered. The material behavior is considered to be elasto-plastic according to the yielding criterion of Mohr-Coulomb. At the elastic region comparisons are made with analytical solutions available. 3 Refs.

Filho, Adolfo, P. (Petrobras SA, Brazil); da Costa, Alvaro Maia; Ebecken, Nelson F.F. *Adv Eng Software* v 10 n 3 Jul 1988 p 131-135.

**073284 IN SITU STRESS PREDICTION AND MEASUREMENT BY HYDRAULIC FRACTURING, WAPITI, ALBERTA.** A combined field and laboratory investigation of the Cardium Formation in the Wapiti Field near Grande Prairie was performed to determine rock mechanical properties and in situ stress magnitude and orientation. An abnormally high minimum horizontal stress gradient, or fracture gradient, close to and exceeding the calculated vertical overburden stress gradient of 24.3 kPa/m is indicated by several pressure decay interpretation techniques. The inferred minimum horizontal in situ stress is between 1 and 4 MPa greater than in the bounding shale units. Regardless of whether laboratory static or sonic log-derived dynamic elastic properties are used, simple predictions of the minimum horizontal in situ stress may be grossly in error in this part of Alberta unless residual and active tectonic stresses are accounted for. The orientations of the major and minor horizontal in situ stresses have been interpreted from wellbore breakouts, differential strain curve analysis, and anelastic strain recovery techniques. The actual induced hydraulic fracture orientation has been determined by monitoring microseismic events downhole during two mini-frac tests. The average predicted fracture orientation of between N35°E and N43°E compares favourably with the average measured N35°E azimuth from these two wells. (Edited author abstract) 36 refs.

**073288 Well Control Team Caps Underwater Blowout. Part 1 - Planning Phase.** Planning separated the project into four distinct phases for organizational purposes: Phase I - engineer, fabricate and procure (14 days). Phase II - mobilization, Louisiana to the well site (14 days). Phase III - capping and killing (28 days). Phase IV - demobilization, well site to Houston (14 days). Each well-kill phase finished on schedule. During Phase III, the capping finished in less than scheduled time. Two capping options are discussed. The use of a riser-capping assembly is discussed. 3 refs.

Anon. *Pet Eng Int* v 59 n 11 Nov 1987 p 22-23, 25-26.

**073289 WELL CONTROL TEAM CAPS UNDERWATER BLOWOUT: PART 2 - EXECUTION PHASE.** A discussion is presented of an underwater blowout and capping in Lake Maracaibo, Venezuela. The initial operation was to remove debris that would affect the kill program. Most of the wreckage from the burned rig lay on the lake floor adjacent to the well site or along the area of the fallen derrick. A 50-ton platform provided a work area for crews and support of some equipment such as the choke manifold and hydraulic lines. The BOP-riser assembly weight rested on the guide base and casing at the lake floor. The surface work area was 30 by 30 ft with a 16 by 16 ft opening in the center. The capping plan required direct access to the 7 in. casing for placement of the explosive charges. The exterior 20-, 13 3/8- and 9 5/8-in. strings had to be removed. Due to the delicacy of maintaining the integrity of the 7-in. pipe, caution and careful execution were paramount for removal of the exterior strings. A team-designed guide base fit onto the 20- and 13 3/8-in. casing strings at the lake bed. The guide base served as a bearing plate to transfer the load to the BOP-riser assembly to the casing and also to provide a stable means for guiding the riser assembly over the well. The final casing cut is discussed and the capping and snubbing operations are outlined. 3 refs.

**Sand Consolidation**

**073294 UNELE CONSIDERATII PRIVIND EFECTELE REALIZATE PRIN INSTALAREA FILTRULOR METALICE SIMPLE IN SONDA IN DREPTUL STRATULUI PRODUCTIV.** [Some Considerations Regarding the Effects Obtained by Installing Simple Metallic Filters in the Well in Line with the Producing Horizon]. The main theoretical and practical aspects are presented regarding the effects obtained by installing metallic slot or orifice filters in the well, in line with the horizon consisting of unconsolidated sand. Calculation methods are indicated in order to establish the proper filter slot size for an efficient process of sand retainment in the bed, as well as calculation relations to estimate the pseudoskin effect factors. Also the methodology is outlined for the calculations of elements characterizing the modifications taking place in the system, due to the presence of a sand filter in the well. (Author abstract) In Romanian. 5 refs.

Tocan, I. (Inst de Petrol si Gaze, Ploiesti, Rom). *Mine Pet Gaze* v 38 n 4 Apr 1987 p 173-176.

**073295 HIGH-TEMPERATURE SAND CONSOLIDATION.** A sand consolidation system has been developed that is stable to wellbore temperature of 700°F [371°C]. Two improvements in technique have contributed to this development. First, a controlled quantity of catalyst is adsorbed on the sand. Consequently, consolidation occurs only on or very near sand grains, resulting in a high-permeability consolidation. Second, the reaction is driven to completion by avoiding, insofar as possible, the adverse effect of water. The resin used for the consolidation is a very viscous derivative of furfuryl alcohol that requires a diluent to make it injectable. The diluent used to reduce viscosity is hydrolyzable ester. The diluted fluid, which is still more viscous than water, displaces much of the water present in the pore space. (Edited author abstract)

Friedman, R.H. (Texaco Inc); Suries, B.W.; Kleke, D.E. *SPE Prod Eng* v 3 n 2 May 1988 SPE 14093, p 167-168.

**Scale Problems**

**073296 SATURATION INDEX PREDICTS BRINE'S SCALE-FORMING TENDENCY.** When natural gas or oil wells produce large volumes of brine/water along with the hydrocarbon, precipitation of calcium carbonate (scale) may be a problem. When brine is produced, the pressure and temperature are lowered, carbon dioxide comes out of solution, and the shift in conditions causes calcium carbonate to precipitate as scale on the inside surfaces of tubulars and processing equipment. This article presents a series of nomographs which can be used to predict the scale-forming tendency, based on the results of relatively simple field chemical tests that can be made by the well operator. The nomographs are based upon rigorous chemical theory, but remove the need for a complex computer program. Further, the scale-forming tendency for each independent parameter is individually given such that the most significant parameters can be readily identified. The results provide the operator with a quantitative measure for the scale-forming tendency which can be used to design or operate the scale control system. 9 refs.

**Stresses**

**073299 MESURES DE CONTRAINTES IN-SITU METHODE DE RELAXATION DES CAROTTES.** [Measuring In-Situ Stresses. Relaxation Method with Core Samples]. This article describes the first results of research on a method for evaluating stresses by measuring the various deformations of a core sample after it has been extracted. The principles of this method and several interpretation aspects published recently in the literature are described in the first part. Then the results of two measurement programs using two SNEA - P wells are described. These tests revealed that the different deformations of a core sample due to the relaxing of stresses can effectively be measured. However, a quantitative interpretation of these measurements requires an improvement to be made in the experimental conditions (thermal stabilization, stabilization of the state of saturation). (Edited author abstract) 6 refs. In French.

**Testing** See Also PETROLEUM RESERVOIR ENGINEERING.

**073300 HOW TO ANALYZE INTERFERENCE WELL TESTS.** The authors examine how wellbore storage and skin effects affect interference test data. The discussion will include analytical models, type curves and recommended procedure for designing and analyzing wellbore storage-dominated interference and pulse test data. 10 refs.

Economides, Michael J. (Dowell Schlumberger, Houston, TX, USA); Ogbe, David O. *World Oil* v 205 n 4 Oct 1987 p 71, 73-76.

**073301 HOW TO ANALYZE INTERFERENCE WELL TESTS - PART 2.** The authors discuss linear flow that occurs in predominantly linear-shaped formations. Several depositional environments, such as river meander point bars, oxbow lakes, river channels and tectonic breccias, could result in predominantly linear flow. Linear fractures, bounded by parallel faults, are frequently observed in highly fractured geothermal reservoirs. Wells drilled in these formations drain volumes that are best described as long, narrow channels. Models for both linear-flow interference testing and vertical interference testing are reviewed through actual case histories. 27 refs.

Economides, Michael J. (Dowell Schlumberger, Houston, TX, USA); Ogbe, David O. *World Oil* v 205 n 3 Sep 1987 p 54-57.

**073302 EXTENDED TEST SYSTEMS HELP APPRAISE SUBSEA WELLS.** An extended test and reservoir appraisal system can help an operator get a better handle on a new offshore field's potential with minimal expense. In view of this, the authors recommend a basic system which uses a diving support class vessel, both as the surface platform to support the production equipment, and as the mooring buoy for the offloading tanker. The system is designed so a minimal amount of modifications need to be made to the offload tanker, which can be from 50,000 to 250,000 dwt capacity - the latter being able to hold 700,000 bbl of oil with segregated ballast. Water depth can be from 200 ft to around 1,500 ft. The advantages of an extended test system are given.

O'Sullivan, Jim (Brown & Root, Houston, TX, USA); Smith, Earl. *Pet Eng Int* v 59 n 4 Apr 1987 p 40, 42-44.

**073303 NEW APPROACH TO INTERFERENCE TEST ANALYSIS.** A new approach for interference test analysis is introduced. A semilog plot of  $tp^2$  vs.  $1/t$  gives a straight line from its intercept, and slope reservoir parameters can be estimated. The method can also be applied to two-rate interference tests for which an iterative procedure is used. Data points from the two regions may be analyzed separately or combined. 5 refs.

**073304 SHORT-TERM TRANSIENT-RATE AND PRESSURE-BUILDUP ANALYSIS OF LOW-PERMEABILITY RESERVOIRS.** This paper presents a technique that reduces test time considerably and obtains accurate formation flow properties before any boundary effects are felt. The technique involves measuring transient rate and pressure at the wellbore during the buildup period and a few minutes before the surface shut-in of the well. The technique is called TRAP (transient rate and pressure) analysis. Having the transient rate during the pressure buildup allows the engineer to correct the pressure data collected during the early portion and to perform the analysis for permeability, skin factor, reservoir pressure, and other formation characteristics. A field example is presented to show the effectiveness of the technique in analyzing low-permeability reservoirs. (Edited author abstract) 26 refs.

Ahmed, Usman (Schlumberger Well Services); Kuchuk, Fikri; Avestaran, Luis. *SPE Form Eval* v 2 n 4 Dec 1987 SPE 13870, p 611-617.

**073305 WELL TEST ANALYSIS OF DATA DOMINATED BY STORAGE AND SKIN: NON-NEWTONIAN POWER-LAW FLUIDS.** We examine pressure falloff behavior dominated by storage and skin subsequent to the injection of a non-Newtonian power-law fluid. New solutions to analyze falloff tests are presented in a form suitable for analyzing field data. The effective wellbore concept is used to combine the wellbore storage constant and skin factor. This phase of our work required extensions to the effective wellbore radius concept (for power-law fluids) given in the literature. To improve analysis procedures, we examine the use of the pressure-derivative technique. We discuss the advantages of this method for the problem under consideration. (Author abstract) 23 refs.

Vongvuthipornchai, S. (Univ of Tulsa, OK, USA); Raghavan, Rajagopal. *SPE Form Eval* v 2 n 4 Dec 1987 SPE 14454, p 618-628.

**073306 PRESSURE DRAWDOWN AND BUILDUP ANALYSIS OF HORIZONTAL WELLS IN ANISOTROPIC MEDIA.** An analytic solution is presented for the pressure response during drawdown and buildup of a horizontal well. This method results from solving the three-dimensional diffusion equation with successive integral transforms. Simplified solutions for short, intermediate, and long times that exhibit straight-line sections when pressure is plotted vs. time are presented. The validity of the method is demonstrated by comparing with results generated numerically by a reservoir simulator and with an analogous analytic solution. Methods for analyzing pressure drawdown and buildup data are presented with examples. The method allows reservoir characteristics, including permeability, skin, and distance to boundaries to be determined. The early-time effects, where the well behaves as if it were in an infinite reservoir, are also discussed. (Edited author abstract) 75 refs.

**073309 EPA DEVELOPS INJECTION WELL PRESSURE TEST: PART 1.** A number of wells have open perforations above the packer and cannot be tested by the standard annulus pressure test. To demonstrate mechanical integrity of the wells, the Ada pressure test was designed and developed by the EPA. In the Ada pressure test, the fluid level in a well is measured to determine the height of the water column above the perforations, the pressure required to depress this column of water to the top of the perforations is calculated. Nitrogen then is added to the annulus until the pressure no longer increases. If the test pressure stabilizes at or very close to the calculated pressure and remains constant for 30 minutes after closing the valve to the nitrogen source, there are no leaks in the casing above the perforations and mechanical integrity is demonstrated. The method was used to test 13 wells in Osage County in 1986. All were witnessed by EPA inspectors and the results were conclusive. Five of the wells passed and eight failed. 2 refs.

**073310 DISEÑO DE PRUEBAS DE INCREMENTO DE PRESION CON EFECTOS DE ALMACENAMIENTO Y DANO. [Build-Up Design with Wellbore Storage and Skin Effects].** A simple procedure to design build-up tests is shown. It is based on the diffusion equation solution for homogeneous and infinite acting reservoirs considering wellbore storage and skin effects. In order to get successful tests, important practical aspects are indicated. A computer program was developed to design automatically the build-up tests. Thus hard work in manipulation of the information is avoided, and the reliability of results is increased. The data and results of the procedure are presented and illustrated with several examples. (Edited author abstract) In Spanish. 8 refs.

**073311 INTERACTIVE WELL-TEST ANALYSIS USING MICROCOMPUTERS.** In spite of the proliferation of well-test analysis literature in recent years, many pressure-transient tests are still being misinterpreted, partly because a logical procedure is lacking and incomplete analysis is performed by nonexpert analysts. The time and difficulty involved in hand-analysis techniques often discourage a complete, consistent analysis. A properly designed computer program that uses interactive graphics can improve the accuracy of test interpretations by enabling the engineer to perform thorough and

consistent analyses quickly and easily. Microcomputers are ideally suited for such a program because of their computing power, portability, and relatively low costs. The development of microcomputers and well-test analysis software places 'expert' interpretive capabilities within the reach of most engineers. (Author abstract). 18 refs.

Heat Transfer

**073316 LAMINAR NATURAL CONVECTION IN VISCOUS OILS.** The laminar, natural convection flow adjacent to a vertical isothermal surface in viscous oils is analyzed. The strong variations of viscosity with temperature is represented by an exponential function. Similarity solutions are found to exist. It is shown that for a heated wall the constant viscosity results underestimate the Nusselt number and overestimate the drag coefficient. For the cooled wall, the opposite is true. The heat transfer results for the heated wall are in very close agreement with the corresponding correlation of previous experimental investigations. A new correlation for the cooled wall is suggested. (Edited author abstract) 7 refs.

Hydrogenation

**073317 ESTIMATION OF AMOUNT OF TRANS, TRANS-ISOMERS OF OCTADECADIENOIC ACIDS IN HYDROGENATED OILS AND FATS.** Hydrogenated oils and fats may consist of a complex mixture of fatty acids, since double-bond migration occurs in addition to inversion of geometric configurations during hydrogenation. An efficient method to estimate the amount of trans, trans-isomers of octadecadienoic acids in hydrogenated oils is described. The method consists of the conversion of triacylglycerols into fatty acid methyl esters (FAME), fractionation of methyl esters by HPLC on silica/silver nitrate, followed by separation of the FAME by capillary gas chromatography, using a CP-Sil 88 column. 1 ref.

**073318 MARCHE DES CATALYSEURS D'HYDROGENATION DES CORPS GRAS.** [Market of Hydrogenation Catalysts for Fats and Derivatives]. Since Institut Francais du Petrole (IFP) has a great deal of experience in the field of catalysts, particularly for hydrogenation, the Evaluation Department has made studies at various times to evaluate the potential markets. The analysis discussed in this article was made to determine the possible outlets for catalysts used for the hydrogenation of fats and oils. It covers the food industry, the hydrogenation of fatty acids of animal or vegetable origin, and the production of fatty alcohols and fatty amines. Whereas the consumption of catalysts used in lipochemistry is highly concentrated in the main industrial regions (United States, Western Europe, Japan), that of the food industry is much more scattered. The three regions mentioned above account for less than 64% of world consumption. (Edited author abstract) In French.

Hydrolysis See Also ENZYMES—Activity.

**073319 LIPASE-CATALYZED OIL HYDROLYSIS IN THE ABSENCE OF ADDED EMULSIFIER.** The purpose of the current study is to investigate the kinetics of oil hydrolysis catalyzed by Candida lipase in the absence of any added emulsifier. The effects of pH, calcium, and water content on the lipolysis rate are also discussed. 18 refs.

Wang, Y.J. (Nat'l Yang-Ming Medical Coll, Taipei, Taiwan); Sheu, J.Y.; Wang, F.F.; Shaw, J.F. *Biotechnol Bioeng* v 31 n 6 Apr 20 1988 p 628-633.

**073320 HYDROLYSIS OF BEEF TALLOW BY LIPASE FROM PSEUDOMONAS SP.** The lipase produced by *Pseudomonas fluorescens* biotype I was selected for hydrolyzing beef tallow at 50-70°C to more than 90% of reaction ratio. Using an amount of lipase sufficient to reach equilibrium, the final reaction ratio was decreased with increasing temperature and the apparent enthalpy of beef tallow hydrolysis obtained by the final reaction ratio was  $-1.93 \times 10^4$  cal/mol, and the final reaction ratio also decreased with increasing substrate concentration. The rising time, which is the reaction time up to one-half of the final reaction ratio, decreased remarkably with increasing temperature, and was closely related to the value of the maximum velocity by the Michaelis constant of this lipase. The final reaction ratio increased with increasing lipase amount up to equilibrium. The feasibility of using parameters obtained by a hyperbolic simulation of the progress curve is discussed. (Edited author abstract) 19 refs.

**073321 THERMAL HYDROLYSIS OF VEGETABLE OILS AND FATS. 1. REACTION KINETICS.** A model is proposed to describe the liquid-liquid thermal hydrolysis of vegetable oils and animal fats. Extensive data on hydrolysis equilibrium and rate have been obtained. Results of the present and previous studies have been compared with model predictions. Uniformly excellent agreement is indicated in all the cases. (Author abstract) 16 refs.

Patil, T.A. (Indian Inst of Technology, Bombay, India); Butala, D.N.; Raghunathan, T.S.; Shankar, H.S. *Ind Eng Chem Res* v 27 n 5 May 1988 p 727-735.

**073322 THERMAL HYDROLYSIS OF VEGETABLE OILS AND FATS. 2. HYDROLYSIS IN CONTINUOUS STIRRED TANK REACTOR.** The hydrolysis can be brought about over a batch of oil by a spray of high-pressure water. This scheme could have somewhat poor productivity in relation to continuous countercurrent operations. No work on semicontinuous hydrolysis has been reported so far. The reaction can also be conducted in a continuous stirred tank reactor. This scheme offers advantages with respect to energy integration and productivity in addition to cost advantages in terms of investment. In this scheme, a mixture of water and oil is pumped to a reactor. In this paper, we examine the behavior of this configuration theoretically by using the model developed earlier. The model predictions are then tested experimentally. 1 ref.

Recovery

**073327 EQUILIBRIUM CHARACTERISTICS FOR EXTRACTIONS IN THE SYSTEM OIL-BEARING MATERIAL-SOLVENT.** The authors have obtained direct experimental data on the equilibrium in the system sunflower petal-oil micelle. In view of the diversity of composition of the extraction benzines used on the oil-seed works, we selected normal hexane as solvent. We have developed the theory of adsorption equilibrium in the system solid body-liquid and carried out a generalization of the experimental data on this basis. This study provides evidence of the essential difference, especially in regions of low concentration, between the equilibrium compositions of pore and external micelles in the extraction of vegetable oil from oil cake. This fact should be taken into account in the design of new and the improvement of existing oil-extraction plants in order to yield extracted meal of low oil content. 7 refs.

**073332 MEERWEIN ARYLATION REACTIONS OF OLEFINS WITH ANTHRAQUINONE DIAZONIUM HYDROGEN SULFATES: FORMATION OF NEW CARBON BONDS AT THE CARBON ATOMS C-1 AND AT C-1,5 OF THE ANTHRAQUINONE SYSTEM.** A survey is presented of Meerwein arylation reactions involving the arylation of olefins with anthraqui-

none diazonium hydrogen sulfate. These reactions comprise an experimentally limited and special section of the otherwise broad applicability and scope of Meerwein reactions. The combinations of the anthraquinone system with olefins having from two to five carbon atoms are attained by using experimental conditions which differ markedly from those patterned after the general performance of Meerwein reactions. The best results are obtained in using diazonium hydrogen sulfates, in contrast to the generally and most conveniently used hydrogen chloride salts. Many further ring-closure reactions of the intermediates thus obtained are reported, yielding condensed heterocyclic aromatic compounds. (Edited author abstract) 30 refs.

## Esterification

**073336 RUTHENIUM-CATALYZED ESTERIFICATION OF OLEFIN WITH METHYL FORMATE.** On the basis of previous findings, we attempted a reaction of methyl formate activated by metal complex with olefin to produce ester, and found that the reaction took place using the ruthenium dihydride complex catalyst, RuH<sub>2</sub>(PPh<sub>3</sub>)<sub>4</sub>. We will discuss this novel synthetic reaction which has not previously been reported. A catalyst screening was made first by using many kinds of transition metal complexes, in order to discover an effective catalyst for the reaction. As a result, RuH<sub>2</sub>(PPh<sub>3</sub>)<sub>4</sub> was found to be a unique effective catalyst among the complexes tested, although the reaction conditions used may not have been adequate for catalyst screening. Other catalysts, for example RuH-(CO)(PPh<sub>3</sub>)<sub>3</sub>, showed some activity but gave very poor results, mainly catalyzing the decomposition of methyl formate. 7 refs.

**073343 HYDROGENATION REACTIONS WITH  $\text{RuCl}_2(\text{TRIPHOS})$ ,  $\text{RuCl}_2(\text{TRIPHOS})$  ( $\text{TRIPHOS} = \text{PhP}(\text{CH}_2\text{CH}_2\text{PPh}_2)_2$ ) CATALYZES THE HOMOGENEOUS HYDROGENATION AND ISOMERIZATION OF OLEFINS, HYDROGENATION OF ALKYNES, ALDEHYDES, KETONES AND NITRILES, UNDER MODERATE REACTION CONDITIONS IN DIFFERENT ORGANIC SOLVENTS.** The hydrogenation of 1-hexene shows a rate increase with higher temperature and pressure. The system shows high selectivity in the reduction of phenylacetylene to the corresponding alkene. The system can also reduce  $\alpha,\beta$ -unsaturated aldehydes to the corresponding saturated aldehyde and unsaturated alcohol. Likewise, the reduction of aldehydes and ketones to alcohols and nitriles to a mixture of primary, secondary and tertiary amines has been observed. (Author abstract) 13 refs.

**073344 AB INITIO MO STUDY OF THE FULL CATALYTIC CYCLE OF OLEFIN HYDROGENATION BY THE WILKINSON CATALYST  $\text{RhCl}(\text{PPh}_3)_3$**

. The potential energy profile for the full catalytic cycle of olefin hydrogenation by the Wilkinson catalyst has been studied with the ab initio MO method. The geometries of the transition states as well as the intermediates have been determined with the RHF energy gradient method for each step of the model Halpern mechanism. The energetics for some critical steps has been calculated also with the second-order Moller-Plesset perturbation theory. The first two steps, exothermic without significant barrier, should take place easily. The olefin migratory insertion has a high barrier. (Edited author abstract) 50 refs.

**073345 EFFECT OF THE HEAT TREATMENT OF Pd THIN FILM ALLOY ON THE HYDROGENATION OF OLEFINS.** Pd-(B, P) thin film alloys have been prepared by an RF sputtering method. Before heat treatment, the selectivity for the partial hydrogenation of olefins increased with the increase in the B or P concentration in the Pd-(B, P) films. After the heat treatment, on the other hand, the selectivity for the partial hydrogenation was reduced over the Pd films with a low B or P concentration. However, in the case of the Pd films with a high B or P concentration, the selectivity was enhanced by the heat treatment. The high selectivity after the heat treatment was explainable in terms of the small ensemble size, the low electron density of Pd, and the appearance of a  $\text{Pd}_3\text{B}$ ,  $\text{Pd}_4\text{P}$ , or  $\text{Pd}_3\text{P}_2$  phase in the Pd films with a high B or P concentration. A sputtered film is known to have a columnar structure. (Edited author abstract) 23 Refs.

#### Isomerization

**073346 HOMOGENEOUS NICKEL-CATALYZED OLEFIN HYDROCYANATION.** In this paper, the authors discuss the chemistry of the du Pont adiponitrile process from a mechanistic viewpoint. The review is restricted to homogeneous nickel-catalyzed hydrocyanation of olefins and depends primarily on du Pont studies. Before discussing hydrocyanation chemistry the authors explore the interaction of zero-valent nickel phosphite complexes with various independent components of the catalytic system. A summary of the mechanism as it is now understood is presented. 73 refs.

**073347 ISOMERIZATION OF OLEFINS CATALYZED BY SILICA-POLYALUMAZINE-PALLADIUM COMPLEXES.** A silica-supported polyalumazine-palladium complex (abbreviated Al-N-Pd) has been found to be an effective isomerization catalyst for olefins. It can catalyze pentene-1 to pentene-2 in 72% yield and hexene-1 to hexene-2 and hexene-3 in yields of 88 and 12%, respectively, at 0°C and under atmospheric pressure. In investigating the solvent effects on the isomerization of hexene-1 catalyzed by Al-N-Pd, it was found that alcohol probably plays a role as promoter. The results show that the inorganic polymer-supported metal complex Al-N-Pd is more active, selective, and stable than other catalysts for isomerization of  $\alpha$ -olefins. (Edited author abstract) 5 refs.

#### Oxidation See Also CATALYSIS; ETHERS—Synthesis.

**073348 PHOTOCHEMICALLY INDUCED OLEFIN OXIDATION BY TITANYL AND VANADYL PORPHYRINS.** This work reports the photocatalytic properties of some titanyl and vanadyl meso-tetraphenyl-

porphyrin monomers and dimers. In each case, cyclohexene was converted to cyclohexene-1,2-epoxy, 6,2-cyclohexen-1-ol 7 and 2-cyclohexen-1-one. Kinetic study shows the reaction to be first order with respect to cyclohexene, and first order with respect to oxygen. In the light of the results, a mechanism for the photocatalytic oxidation of cyclohexene induced by titanyl or vanadyl porphyrins (P) is suggested, which implies singlet oxygen as the oxidizing agent. 31 refs.

**073349 REGIO- AND STEREOSELECTIVITY OF THE EPOXIDATION REACTION OF ETHYLIDENENORBORNENE.** Epoxidation of ethylenenorbornene, a mixture of E- and Z-stereoisomers, with an equimolecular amount of per acid (peracetic, monoperphthalic) occurs regiospecifically at the extracyclic strained double bond and stereoselectively predominately from the exo-direction of the norbornene fragment. In the case of monoperphthalic acid the reaction is complicated by isomerization of the monoepoxide to endo-2-acetyl-bicyclo[2,2,1]hept-5-ene. Stereoisomeric diepoxides of ethylenenorbornene were isolated by reaction of per acids and the monoepoxides. Spectra of the synthesized compounds were studied using IR and PMR spectral parameters. (Author abstract) 10 refs.

**073350 USE OF SOLVENTS IN THE LOW-PRESSURE PLASMA OXIDATION OF OLEFINS.** The oxidation of n-octene has been studied in mixtures with dimethylbutane, 1,4-dimethylcyclohexane, ethylcyclohexane, and dibutyl ether. Except for dimethylbutane, total yields increase on addition of a solvent, and the fraction of epoxide among the products is higher than in reactions with neat octene. The main constituents of oxygen plasmas are ground-state molecules  $\text{X}^3\Sigma^-$ , singlet oxygen molecules  $^1\Delta_g$ , and ground-state oxygen atoms  $^3\text{P}$ . Ozone can be neglected in the low-pressure range. Singlet oxygen may react with allylic hydrogens to form hydroperoxides; toward other hydrogens, it is inert. (Edited author abstract) 12 refs.

**073351 KINETICS OF THE LIQUID-PHASE OXIDATION OF TRI- AND TETRA-CHLOROETHYLENES.** Studies have been made concerning the kinetic mechanism of the liquid-phase oxidation of tri- and tetra-chloroethylene initiated by azodiisobutyronitrile. The kinetic parameters of the reactions have been calculated. The rate constants of chain propagation and termination reactions ( $k_2$  and  $k_6$ ) obtained and also the ratio  $k_2/k_6^{1/2}$  may be used to calculate cooxidation curves of organic compounds, in other words, to obtain crossed rate constants of reactions and solve theoretical and practical problems in the field of liquid-phase oxidation. (Edited author abstract) 6 refs.

Kucher, R.V. (Acad of Sciences of the Ukrainian USSR, L'vov, USSR); Flyunt, R.I.; Timokhin, V.I. *Kinet Catal* v 28 n 4 pt 2 Jul-Aug 1987 p 860-862.

**073352 OXIDATION OF OLEFINS WITH  $\text{O}_2$  AND  $\text{NaBH}_4$  CATALYZED BY MANGANESE meso-TETRAKIS(p-SULFONATOPHENYL)PORPHIN.** The oxidations of olefins with molecular oxygen and a reducing agent couple catalyzed by metal meso-tetrakis(p-sulfonatophenyl)porphyrins  $[\text{Me}(\text{TPPS})]$  in methanol solvent was studied and compared with that by metal meso-tetraphenylporphyrin  $[\text{Me}(\text{TPP})]$ . In the oxidation of cyclohexene by  $\text{Me}(\text{TPPS})$ ,  $\text{Mn}(\text{TPPS})$  coupled with  $\text{NaBH}_4$  was the most effective for producing cyclohexanol as a main product, and its activity was higher than that of  $\text{Mn}(\text{TPP})\text{Cl}$ . On comparing its activity with that of the

Mn(TPPS)/iodosobenzene system capable of producing a high-valent metal oxo-type active species, it was deduced that the Mn(TPPS)/O<sub>2</sub>/NaBH<sub>4</sub> system catalyzed the olefin oxidation by forming a non-metal oxo-type active species. (Author abstract) 12 refs.

**073353 REACTIVITY OF UNSATURATED COMPOUNDS IN REACTION WITH PEROXY RADICALS.** This article is devoted to an analysis of the reactivity of unsaturated compounds in reaction with peroxy radicals, and the relation between reactivity and the rate and selectivity of epoxidation. In the reaction of hydrogen atom detachment from olefins and addition by a double bond, the peroxy radical exhibits electrophilic properties, and the molecule nucleophilic properties. The reaction passes through a polar transition state. The introduction of a double bond into a cycloalkane and n-alkane molecule leads to an increase in the rate constant of detachment of the hydrogen atom by the peroxy radical by a factor of 10<sup>3</sup>, and of the two double bonds by a factor of 10<sup>5</sup>. For olefins with a rigid skeleton, the α-C-H bonds are completely passive. 45 refs.

**073354 D<sup>0</sup> METAL PEROXIDES AS HOMOLYTIC AND HETEROLYTIC OXIDATIVE REAGENTS. MECHANISM OF THE HALCON EPOXIDATION PROCESS.** The role of d<sup>0</sup> metal peroxides as intermediates in catalytic oxidations involving H<sub>2</sub>O<sub>2</sub> and ROOH as the oxygen source is studied through the stoichiometric oxidizing properties of the isolated d<sup>0</sup> metal peroxidic complexes. Whereas heterolytic epoxidation of olefins requires the coordination of olefins as a prerequisite for a cyclic or a pseudocyclic peroxymetalation mechanism, homolytic oxidation of hydrocarbons involves a bimolecular mechanism with radical intermediates, and is less selective. A complete elucidation of the mechanism of the Halcon epoxidation process has been made possible by studying the reactivity of the complexes VO(OPhSal)-(OOtBu) towards olefins. (Author abstract) 17 refs.

**073355 NOVEL WACKER ROUTE BASED ON RUTHENIUM(III) ION FOR OLEFIN OXIDATION TO KETONES.** The oxidation of 1-hexene to the end ketone 2-hexanone by molecular oxygen is catalyzed by Ru(III) ion, [RuCl<sub>2</sub>(H<sub>2</sub>O)<sub>4</sub>]<sup>+</sup> at 35°C (μ = 0.1 M) in 1:1 (v/v) water-dioxane solution at pH 2.00. The reaction shows a first-order dependence in catalyst and substrate concentrations and a one-half-order dependence with respect to molecular oxygen concentration. A mechanism involving a combination of a peroxometalacycle and the Wacker oxidation route to ketone formation is proposed. Finally, on the basis of kinetics and the mechanism proposed, a rate law for the oxidation reaction was derived and the corresponding rate constants evaluated. (Edited author abstract) 31 refs.

**073357 THEORETICAL INTERPRETATION OF REACTIVITY RATIO PRODUCTS IN COPOLYMERS FORMED FROM TWO FRACTIONS DIFFERING IN COMPOSITION.** Reactivity ratio products for ethylene-propylene copolymerization over catalysts with two sites differing in incorporation and/or reactivity ratio product have been theoretically derived. It is shown that combination of the polymer fractions resulting from two sites can lead to large dyadic reactivity ratio products as determined by nuclear magnetic resonance. The dyadic reactivity ratio product is calculated at several different monomer ratios in the reactor, and compared to the reactivity ratio product obtained from a least-squares fit of the copolymerization equation. When the polymers are compositionally heterogeneous, the reactivity ratios derived from kinetic measurements are not meaningful. (Author abstract) 10 refs.

**073358 THERMODYNAMICS OF THE CATALYTIC POLYMERIZATION OF ALKENES IN THE GAS PHASE.** The polymerization of alkenes is catalyzed by zeolite catalysts in the temperature range 450-800 K. As expected from thermodynamics the degree of polymerization is higher at lower temperatures and higher pressures. Equilibrium distributions of alkene isomer groups in the ideal gas phase have been calculated over a range of temperatures and pressures. The use of isomer groups greatly reduces the number of species that have to be considered in an equilibrium calculation and provides a means for extrapolating to higher carbon numbers. Since ZSM-5 is selective, equilibrium distributions have also been calculated for three restricted isomer groups from which certain bulky isomers have been excluded. Comparison of theory and experiment provides a means for learning about the nature of isomers excluded by the catalyst. (Author abstract) 25 refs.

**073361 TRANSIENT RESPONSE OF CONTINUOUS-FLOW STIRRED-TANK POLYMERIZATION REACTORS.** The transient behavior of polymer properties following a step change in feed conditions during copolymerization in a continuous-flow stirred-tank reactor has been investigated by both modeling and experiment. For kinetics appropriate to Ziegler catalyzed olefin polymerization, the dynamic response of polymer molecular weight and composition is predicted to be relatively slow; four to six reactor turnovers could be required to reach steady state. In addition, response time depends on the direction and magnitude of change and is generally shorter when a property value is decreased. These model

predictions were confirmed by measurement of the transient response of copolymer composition and molecular weight for ethylene-propylene-ethylidene norbornene terpolymerization. The model equations also were used to simulate reactor startups, and it was found that steady state following a startup can be reached in about three reactor turnovers. The initial absence of polymer in the reactor causes the dynamic response to be faster for a startup than for reactor control. (Author abstract) 7 refs.

**073363 FORMATION AND GROWTH OF POLY-PROPYLENE AND POLYETHYLENE PARTICLES DURING THE POLYMERIZATION OF OLEFINS ON DEPOSITED CATALYSTS.** The laws governing the formation and growth of polymeric particles obtained in the polymerization of propylene and ethylene on TiCl<sub>3</sub> deposited on the surface of microspherical mesoporous copolymers of styrene and divinylbenzene have been investigated in the present work. It has been found that, during polymerization, the catalyst undergoes replication leading to the formation of polymers in the form of coarse granules 1.5-4.5 mm in diameter and spherical in shape, whose structures are similar to that of the carrier particles. It is shown that the carrier's pore size and the polymerization rate have the decisive effect on the regime under which the deposited catalyst operates. (Edited author abstract) 21 refs.

**073364 HIGH ACTIVITY MIXED METAL ALKYL COCATALYSTS FOR α-OLEFIN POLYMERIZATION.** High activity α-olefin polymerization catalysts are generally obtained by mixing MgCl<sub>2</sub>-supported TiCl<sub>4</sub> (MgCl<sub>2</sub>/TiCl<sub>4</sub>) with aluminum trialkyl cocatalyst. Surprisingly, AlEt<sub>2</sub>Cl, which is the preferred cocatalyst in polymerization employing nonsupported Ti compounds, is a poor cocatalyst when used with MgCl<sub>2</sub>/TiCl<sub>4</sub>. It was found that in propylene and 1-butene polymerizations, using different MgCl<sub>2</sub>/TiCl<sub>2</sub>/TiCl<sub>4</sub> catalysts, the cocatalyst activity of AlEt<sub>2</sub>Cl can be greatly improved by the addition of a magnesium or lithium alkyl. The mixed metal alkyl obtained from AlEt<sub>2</sub>Cl and MgBu<sub>2</sub> is a particularly effective cocatalyst always yielding more polymer, of about the same stereospecificity, than the conventional aluminum trialkyls. The exact nature of the mixed metal alkyl cocatalysts is not known, but the available evidence argues against in situ aluminum trialkyl formation resulting from the alkylation of AlEt<sub>2</sub>Cl by the second metal alkyl. (Author abstract) 7 refs.

**073365 KINETIC STUDY OF THE PHOTOSENSITIZED CYCLOPOLYMERIZATION OF N,N'-METHYLENEBISACRYLAMIDE.** This work on the photopolymerization of this monomer using uranyl ion as photosensitizer was undertaken with a view to finding out whether cyclization of the radical occurs under these conditions or not, and also to establish the mechanism. The evidence for cyclization of the radical prior to propagation was obtained from the IR spectrum of the

polymer. If cyclization had not occurred, the polymer should have a double bond, yet no peak corresponding to a double bond was observed in the spectrum. The absence of double bonds could also be due to the formation of crosslinked polymers. However, the polymer obtained was soluble in pyridine-water mixtures and, hence, cannot be crosslinked appreciably. 6 refs.

**073366 CHEMISTRY OF OLEFIN OLIGOMERIZATION OVER ZSM-5 CATALYST.** Light olefins ( $C_3$ - $C_6$ ) can be converted to a mixture of higher molecular weight olefins via a sequence of acid-catalyzed-shape-selective polymerization and isomerization reactions over the ZSM-5 zeolite catalyst. The composition and molecular weight of the product are very dependent on reaction temperature and pressure through both thermodynamic and kinetic constraints. Distillate-range olefins having an almost petrochemical-type structure with high-quality fuel properties are produced at relatively high pressure (30-100-bar) and lower temperature (200-300°C) conditions. At lower pressure and higher temperature, lower molecular weight products are formed, including aromatics and saturates from olefin condensation and hydrogen-transfer reactions. (Author abstract) 15 refs.

Quann, Richard J. (Mobil Research & Development Corp, Paulsboro, NJ, USA); Green, Larry A.; Tabak, Samuel A.; Krambeck, Frederick J. *Ind Eng Chem Res* v 27 n 4 Apr 1988 p 565-570.

**073367 METALLOCENE-METHALUMINOXANE CATALYST FOR OLEFIN POLYMERIZATION. II. BIS- $\eta^5$ -(NEOMETHYL CYClopentadienyl) ZIRCONIUM DICHLORIDE.** Bis(neomethyl cyclopentadienyl)zirconium dichloride/methyl aluminumoxane ( $\eta^5\text{-C}_5\text{Me}_5\text{ZrCl}_2/\text{MAO}$ ) catalyze investigation for ethylene polymerization. About 51% of the Zr forms active sites more or less instantaneously according to quenching with tritiated methanol. There is an initial drop of rate of polymerization,  $R_p$ , of about 30% which remains constant thereafter. The  $\text{TiCl}_3/\text{MgCl}_2$  and  $(\text{NMCp})_2\text{MAO}$  catalysts have nearly the same activation energy for propagation (ca. 7 kcal/mol $^{-1}$ ). The higher activity of the latter is due to its larger preexponential factor in  $k_p$ . (Edited author abstract) 15 refs.

**073369 INDUSTRIAL HYDROFORMYLATION OF OLEFINS WITH RHODIUM-BASED SUPPORTED LIQUID PHASE CATALYST (SLPC) - PART V. THE FORMATION OF 2-ETHYL-2-HEXENE**

**NAL AND PROPANE: EXTRINSIC CATALYST POISONING.** Hydridocarbonyltris(triphenylphosphine)-rhodium(I) dissolved in liquid triphenylphosphine and capillary condensed into the pores of a porous support is studied as a possible heterogeneous catalyst for the industrial hydroformylation of olefins. The extent of the side reactions, hydrogenation to propane and aldolization to 2-ethyl-2-hexenal, is studied. The hydrogenation does not occur in the temperature range 90-120°C with hydrogen/carbon monoxide ratios equal to or below 3. The danger of aldolization and consequently leaching of the catalyst is negligible under practical conditions. This is certainly the case if the degree of liquid loading of the catalyst is 0.20. (Edited author abstract) 13 refs.

Herman, J.M. (Delft Univ of Technology, Delft, Neth); van Krugten, P.J.; van den Berg, P.J.; Scholten, J.J.F. *Chem Eng J Biochem Eng J* v 35 n 1 May 1987 p 25-35.

**073370 DISPROPORTIONATION OF HEX-1-ENE ON AN ALUMINO-COBALT-MOLYBDENUM CATALYST.** The activity, selectivity and stability of aluminocobalt-molybdenum catalysts in the disproportionation of olefins were demonstrated to depend on olefin composition, the method of preparation and conditions of heat treatment. A catalyst containing molybdenum and cobalt oxides in a proportion of 15.7 and 4.5% respectively was shown to be for disproportionation of hex-1-ene. Replacement of cobalt oxide additive by nickel oxide in an aluminocobalt-molybdenum catalyst for olefin disproportionation is ineffective. Scanning electron spectroscopy established that a catalyst having a dense and ordered structure with pore size of 0.5-1.5  $\mu\text{m}$ , isomeric particle size of 0.3  $\mu\text{m}$  has the highest activity; these particles accumulate in lamellar units (1.5-4  $\mu\text{m}$ ). 15 refs.

Ignatov, V.M. (I.M. Gubkin Inst of Petrochemical & Gas Industry, Moscow, USSR); Belov, P.S.; Usacheva, G.A.; Bochkov, R.A. *Pet Chem USSR* v 26 n 1 1986 p 28-34.

**073371 ELECTROCHEMICAL BROMINATION OF c-HEXENE ON A Pt ELECTRODE IN NITROMETHANE SOLUTION.** In this process a complex intermediate forms between the olefin and  $\text{Br}_2$  evolved and it transforms to dibromo-c-hexane. At higher potential values the electrochemical oxidation of this complex results bromo-c-hexane, the formation of which is hindered by oxide layer on the electrode surface. On the basis of the experimental results it can be concluded that the electrochemical oxidation of the complex intermediate leads partly to a new product as  $\text{BrCHOH}$ . At higher water concentration this process is hindered assumingly by the formation of an oxide layer. (Edited author abstract) 20 refs.

Visy, Cs. (Univ of Szeged, Szeged, Hung); Novak, M. *Electrochim Acta* v 32 n 12 Dec 1987 p 1757-1759.

**073372 STUDIES OF THE MECHANISM OF THE OLEFIN METATHESIS REACTION AND THE PROCESS OF ACTIVE SITE FORMATION ON PHOTOREduced MOLYBDENUM-SILICATE CATALYSTS. 1. MECHANISM OF FORMATION OF MOLYBDENUM-CARBENE INTERMEDIATES.** The products of the initial stages of the reaction of ethylene and propylene with  $\text{Mo}^{4+}$  ions in photoreduced molybdenum-silicate olefin metathesis catalysts have been studied by mass spectroscopy. The reaction of  $\text{C}_2\text{H}_4$  with  $\text{Mo}^{4+}$  has been found to yield propylene, whereas interaction of  $\text{C}_3\text{H}_6$  with  $\text{Mo}^{4+}$  gives a superequilibrium concentration of butenes and a small amount of pentenes. A significant kinetic isotope effect for the metathesis reaction was observed upon substitution of  $\text{C}_3\text{H}_6$  by  $\text{C}_3\text{D}_6$ . The results can be interpreted in terms of a stepwise mechanism involving carbene intermediates, which are formed via isomerization of surface-bound  $\pi$ -complexes of olefins with  $\text{Mo}^{4+}$  ions as a result of intramolecular 1,2-H atom transfer. (Author abstract) 17 refs.

Elev, I.V. (Acad of Sciences of the USSR, USSR); Shelimov, B.N.; Kazanskii, V.B. *Kinet Catal* v 28 n 2 pt 2 Mar-Apr 1987 p 357-362.

**073373 STUDIES OF THE MECHANISM OF THE**

**OLEFIN METATHESIS REACTION AND THE PROCESS OF ACTIVE SITE FORMATION ON PHOTOREduced MOLYBDENUM-SILICATE CATALYSTS. 2. 'PRODUCTIVE' AND 'DEGENERATIVE' METATHESIS OF  $\text{C}_2\text{H}_4$ - $\text{C}_2\text{D}_4$  AND  $\text{C}_2\text{H}_4$ - $\text{C}_3\text{D}_6$  MIXTURES.** The specific catalytic activity of photoreduced  $\text{Mo}^{4+}/\text{SiO}_2$  samples has been compared for 'productive' and 'degenerate' metathesis reactions of  $\text{C}_3\text{H}_6$ - $\text{C}_3\text{D}_6$  and  $\text{C}_2\text{H}_4$ - $\text{C}_2\text{D}_4$  mixtures. It has been found that, under comparable conditions, the rate of 'degenerate' metathesis of ethylene is 4-5 times slower than the rate of 'productive' metathesis of propylene, although the rate of 'degenerate' metathesis of propylene is  $5.10^3$ - $10^4$  times greater than its rate of 'productive' metathesis. Based on these results, it is concluded that 'degenerate' metathesis of propylene occurs via the involvement of secondary (ethylidene) carbenes. (Author abstract) 8 refs.

**073374 IRON-PHTHALOCYANINE CATALYZED EPOXIDATION OF OLEFINS BY  $\text{KHSO}_5$ .** Because of the high efficiency of potassium hydrogen persulfate,  $\text{KHSO}_5$ , in catalytic epoxidation of olefins or hydroxylation of alkanes, we decided to investigate the epoxidation by  $\text{KHSO}_5$  and metallophthalocyanines. We report the epoxidation of cyclohexene, styrene and tetramethylethylene. It is shown that phthalocyaninato-iron complexes are able to catalyze the oxygen transfer from  $\text{KHSO}_5$  to an olefin, but rather low catalytic activities are obtained due to a fast oxidative intramolecular destruction of the catalyst. One way to improve its activity is to create a cage around the high-valent metal-oxo species by increasing the steric constraints along the axis perpendicular to the macrocycle plane, as observed for metalloporphyrin-catalyzed oxygenations. 21 refs.

**073375 STUDIES OF THE EFFECT OF BRONSTED ACIDS AND THE FORM OF THE SECOND TRANSITION METAL ON A ZIEGLER-TYPE CATALYTIC SYSTEM FOR OLEFIN DIMERIZATION.** Studies have been carried out concerning the effect of Bronsted acids on the catalytic activity of  $\text{Ni}(\text{C}_5\text{H}_7\text{O}_2)_2(\text{C}_2\text{H}_5)_2\text{AlCl}(\text{C}_6\text{H}_5)_3\text{P}$  with respect to dimerization of lower olefins. Strong acids have been found to improve, and weak acids to diminish, the catalytic activity of this system. The direction of insertion of propylene into the Ni-H-bond can also vary, depending on the acidity. The use of transition metal additives can significantly enhance the catalytic activity of the system, by acting as an oxidant in the activation process. (Author abstract) 7 refs.

Dobrev, D. (A.S. Zlatarov Higher Chemical Technological Inst, Burgas, Bulg); Kurtev, K. *Kinet Catal* v 28 n 4 pt 2 Jul-Aug 1987 p 872-875.

**073376 MECHANISM OF THE HYDROCARBOXYLATION AND HYDROCARBOMETHOXYLATION OF OLEFINS AND DIOLEFINS IN THE PRESENCE OF PYRIDINE.** The adequacy of the reaction mechanisms for the case of the use of cobalt carbonyls as catalysts is discussed. It is shown that the carbocation mechanism does not correspond to the reaction kinetics and the composition of the products. The mechanism according to which  $\text{HCO}(\text{CO})_4$  is bonded to the olefin according to a molecular pathway or with the participation of ions, but synchronously, while pyridine accelerates hydrocarboxylation and hydrocarbomethoxylation through the formation of an acylpyridinium salt, is free of these short-comings. Such a mechanism explains the specifics of the action of pyridine in comparison with other Lewis bases. (Author abstract) 42 refs.

**073377 PHASE AND VOLUME-DEPENDENT RELATIONSHIPS IN HYDROGEN-1 HEXENE, HYDROGEN-1-OCTENE, AND HYDROGEN-C<sub>15</sub>-C<sub>18</sub> OLEFIN SYSTEMS.** In the study and development of hydroformylation and hydrocarboxylation processes of olefins, data are required on the liquid-gas phase equilibria for several systems, including the hydrogen-olefin system. The authors determined the composition of the equilibrium gas and liquid phases and the volume-dependent behavior of the latter in the hydrogen-1-hexene and hydrogen-1-octene systems in the temperature range 313-453°K and at pressure of up to 30 MPa, and in the hydrogen-C<sub>15</sub>-C<sub>18</sub> olefin system in the temperature range 313-553°K and a pressure also of 30 MPa. The volatility of hydrogen in the gas phase was calculated according to the additivity rule, from the data on the volatility of pure hydrogen and the composition of the gas phase. The results of the thermodynamic analysis showed that one of the authors' equations satisfactorily describes the experimental data of the systems studied at temperatures up to approximately 393°K and at pressures up to 20 MPa only. 10 refs.

**073378 HYDROSILYLATION CHEMISTRY AND CATALYSIS WITH cis-PtCl<sub>2</sub>(PhCH=CH<sub>2</sub>)<sub>2</sub>.** The precursor cis-PtCl<sub>2</sub>(PhCH=CH<sub>2</sub>)<sub>2</sub> is shown to catalyze (i) the hydrosilylation of various terminal olefins and acetylenes, (ii) the reduction of carbonyl functions with silanes in the presence of pyridine or aniline as cocatalyst, and (iii) the formation of R<sub>3</sub>SiOR<sup>2</sup> from R<sub>3</sub>SiH and R<sup>2</sup>OH. The hydrosilylation of styrene is shown to proceed via reduction of PtCl<sub>2</sub>(PhCH=CH<sub>2</sub>)<sub>2</sub> to Pt(PhCH=CH<sub>2</sub>)<sub>3</sub> with concomitant formation of 2 equiv of R<sub>3</sub>SiCl and 1 equiv of PhCH<sub>2</sub>CH<sub>3</sub>. Extensive <sup>195</sup>Pt measurements together with <sup>13</sup>C studies on complexed styrene selectively enriched at the β-carbon support the formation of the Pt(0) complex. The precursor cis-PtCl<sub>2</sub>(PhCH=CH<sub>2</sub>)<sub>2</sub> is suggested to arise from the trans isomer which is identified by <sup>195</sup>Pt NMR and its reaction chemistry. (Author abstract) 19 refs.

**073379 EPOXIDATION OF OLEFINS USING cis-DIOXOMOLYBDENUM COMPLEXES AS CATALYSTS.** Cis-dioxomolybdenum complexes, having tetradentate and tridentate ligands, as catalyst with t-butylhydroperoxide gave epoxides from olefins in good yield. The catalysts, except MoO<sub>2</sub>(apac), have been found to withstand the oxidative conditions. The steric environment due to the ligand around the metal center plays a significant role in the epoxidation of substituted olefins, viz., isoprene and 1,2-dimethyl-1,4-cyclohexadiene and cis- and trans-2-hexene. The steric effect due to nonporphyrin ligands is much less than that observed with catalysts having porphyrin ligands. (Author abstract) 28 refs.

**073380 PROCESO OLIMP TECNOLOGIA IMP PARA PRODUCCION DE OLEFINAS. [OLIMP Process IMP Technology for Olefin Production].** Olefin production technology (OLIMP) has been developed that involves basic cracking furnace design and separation equipment and scheme for the whole process, which can be designed for both gaseous (ethane and propane) and liquid (naphtha or gas-oils) feedstocks. The development technology requirements for this process are described, mainly for the reaction system, the phase equilibria involved, and basic equipment sizing. The tools that have been used for basic engineering development and applied and adapted successfully in the OLIMP process are

described. Technological developments specifically for this process, concerning mainly modeling for the mass and energy balance and geometry and sizing analysis for the furnaces, are discussed. Finally results are presented which compare predicted behavior of the furnaces with those for other designs and plants. (Edited author abstract) In Spanish.

## Recovery

**073381 ADSORPTIVE RECOVERY OF OLEFINS FROM MIXTURES WITH PARAFFINS.** The largest source of linear olefins is the process of dehydrogenation of high-molecular-weight paraffins. However, the dehydrogenated products obtained in a single pass will contain no more than 8-12% n-olefins by weight. The authors are reporting on a study of the recovery of olefins from mixtures with paraffins by adsorption on synthetic zeolites; this work has been aimed at obtaining experimental data as a basis for developing a mathematical model of the process of recovery of higher n-olefins from the products of n-paraffin dehydrogenation, by means of pseudocontinuous adsorption. 6 refs.

**Solubility** See Also CHEMICAL OPERATIONS—Solvent Extraction.

**073382 SOLUBILITIES OF PROPENE, BUTANE, ISOBUTANE AND ISOBUTENE GASES IN n-OC-TANE, CHLOROBENZENE AND n-BUTANOL SOLVENTS.** Solubilities are reported for atmospheric pressure and temperatures of 298.15, 323.15 and 343.15 K for the gases propene, butane, isobutane and isobutene in the solvent n-octane, chlorobenzene and n-butanol. The solvents were chosen to investigate the effect of the nature of the solvent on gas solubility. The solvents range from the non-polar (octane) to slightly polar (chlorobenzene) and to polar and associating (butanol). The order of gas solubilities in the slightly polar chlorobenzene is found to be closely related to the normal boiling points of the dissolving gases. A method for relating solubilities at various temperatures in similar polar and associating solvents is examined. (Author abstract) 23 refs.

## Synthesis

**073383 SYNTHESIS OF OLEFINS FROM METHANOL ON SiO<sub>2</sub> SUPPORTED Ag<sub>4</sub> (SiW<sub>12</sub>O<sub>40</sub>) CATALYSTS.** The conversion of methanol to hydrocarbons was investigated to Aerosil supported Ag<sub>4</sub> (SiW<sub>12</sub>O<sub>40</sub>) catalysts. It was shown that the support has a stabilizing effect on catalytic activity. Three patterns of activity/running-time behaviour of the catalysts were found according to the surface concentration of the active component. Results indicated that the deposition of coke causing catalytic deactivation takes place predominantly at the exterior surface of the catalyst, whereas active sites within the pore system remain untouched by deactivation. Best results with respect to the production of olefins and other hydrocarbons were obtained in the medium range of surface concentrations of the active component. (Edited author abstract) 12 refs.

Ehwald, H. (Acad Sciences of the GDR, Berlin-Adler-shof, East Ger); Fiebig, W.; Jerschke, H.-G.; Lischke, G.; Parltz, B.; Schreier, E.; Oehlmann, G. *Appl Catal* v 34 n 1-2 Oct 15 1987 p 13-22.

**073384 SYNTHESIS OF OLEFINS FROM METHANOL ON ALUMINA-SUPPORTED H<sub>4</sub>(SiW<sub>12</sub>O<sub>40</sub>) CATALYSTS.** The conversion of methanol to hydrocarbons was investigated on alumina-supported H<sub>4</sub>(SiW<sub>12</sub>O<sub>40</sub>) catalysts. Depending on the concentration of the heteropoly compound, two different types of [SiW<sub>12</sub>O<sub>40</sub>]<sup>4-</sup> anions exist on the surface of the catalysts. Increasing the H<sub>4</sub>(SiW<sub>12</sub>O<sub>40</sub>) concentration from 5 to 40 wt% of W results mainly in an increase in the surface density of Bronsted centres, whereas the distribution of their acidic strength is only slightly shifted towards higher values. From the dependence of the yield of the hydrocarbon on the H<sub>4</sub>(SiW<sub>12</sub>O<sub>40</sub>) content of catalysts, it is concluded that under the conditions applied hydrocarbon synthesis from methanol occurs only on adjacent acid groups, the density of which is evaluated to be approximately 1 μmol/m<sup>2</sup>. (Author abstract) 6 refs.

**073385 SYNTHESIS OF POLYALCOHOLS VIA ZIEGLER-NATTA POLYMERIZATION.** Functional polymers are normally difficult to prepare by Ziegler-Natta polymerization because of catalyst poisoning and other side reactions. This paper describes the synthesis of functional α-olefins via the intermediacy of novel borane monomers and polymers. Borane monomers, derived from monohydroboration of appropriate dienes with dialkylborane, have been found to be stable to titanium-based Ziegler-Natta catalysts. In turn, the borane polymers are easily converted to a variety of other functionalities, under mild reaction condition. This paper focuses on the preparation and molecular structure characterization of polyalcohols prepared according to this route. Moreover, some physical properties, such as high-temperature stability of these materials, are mentioned in this content. (Author abstract) 13 refs.

## Applications

**073386 CHARACTERISTICS OF FORMATION OF NETWORK STRUCTURE IN EPOXY-OLIGOESTER MIXTURES.** By using mixtures of oligomers as binders in production of various materials it is possible to bind the range of their properties considerably in comparison of products made from pure oligomers. Binders of this kind include, for example, epoxy-oligoester mixtures (EPOEM). Knowledge of the temperature-time sequence of these reactions is needed for active regulation of the hardening process and production of materials having specified properties. The EPOEM studied by us differ from known compositions not only in chemical structure and component ratio but also by the presence of phosphazenes. We used IR spectroscopy and DTA for investigating the kinetics of formation of network polymers based on the EPOEM studied. Study of the character of hardening of EPOEM containing OPC and PNA showed that the activating energy of hardening at 50-100° in both cases is 67 kJ/mole, which differs little from the value for EPOEM. This indicates once again that the initial stage of formation of a network polymer is basically the same for all the EPOEM studied. Introduction of initiators of radical processes into EPOEM has virtually no influence on the general course of hardening. 14 refs.

## Curing

**073387 RHEOKINETICS OF CURING OF AN EPOXYORGANOSILICON OLIGOMER BY AGENTS OF VARIOUS FUNCTIONALITY.** The process of curing of an epoxyorganosilicon oligomer by metal-organic curing agents of various functionality - tetrabutyltitanium, and polybutoxytitanium phosphoroxane - was studied by several rheological methods. Phenomenological models of the curing rheokinetics were constructed and compared with known equations for curing agents of different type. The results conclusively indicate that the functionality of the curing agent, at identical chemical nature of the participating reactive groups, has a profound influence on the type of kinetic equation describing the curing process. An increase in the functionality of the curing agent and thus of the reaction system as a whole leads to the transformation of the most general equation for curing processes, with autoacceleration, into an equation reflecting the possibility of autoinhibition of the process in its course. (Edited author abstract) 17 refs.

**073388 CURING EPOXY-OLIGOMERS BY CYANURATE COMPLEXES OF IRON.** This work reports the investigation of  $\alpha$ -oxide rings (OR) of diglycidyl ester of diphenylolpropane (DEPD) with CC (Cyanurate Complexes). It is shown that the  $\alpha$ -epoxy rings of the epoxides react with CC in three stages: with the liberation of ammonia, and then at the O-M and C-O-C bonds, followed by the isomerization of cyanurate fragments into isocyanurates. Under conditions of an excess of the  $\alpha$ -oxide rings, the reaction of the epoxides with CC at temperatures above 100°C leads to the formation of oxazolidone fragments. 11 refs.

## Electric Conductivity

**073389 CHARGE-TRANSFER COMPLEXES OF A CONJUGATED OLIGOMER WITH IODINE: EVIDENCE FOR POLARON, BIPOLARON, AND IONIZED BIPOLARON FORMATION.** This paper describes the results of electron spin resonance experiments on the charge-transfer complexes that are formed when the conjugated oligomer poly(4,4'-dibromobiphenyl-co-1,4-diethynylbenzene)-dibromobiphenyl-co-1,4-diethynylbenzene is doped with iodine. The dependence of the spin susceptibility on the iodine content is interpreted in terms of the formation of polarons (radical cations with) bipolarons (cations  $S = 0$ ), and ionized bipolarons (radical trications  $S = \frac{1}{2}$ ). The dependences of the effective  $g$  value and the line-shape parameters on the iodine content are explained in terms of an equilibria scheme involving different stoichiometric forms of these two types of radical cations. A dependence of the line-shape parameters on the radical concentration is also identified and is explained in terms of intermolecular spin-spin interactions. (Author abstract) 11 refs.

**Esterification** See POLYETHYLENE TEREPHTHALATE.

## Flammability

**073391 FLAMMABILITY OF OLIGOISOBUTENES WITH OXYGEN-CONTAINING END GROUPS.** The behaviour of oligoisobutenes under combustion conditions has not been studied before. Accordingly, the authors carried out a comparative study of the stages of ignition and steady combustion of OIB and polyisobutene (PIB). It is shown that there is an experimental linear relationship between the mass combustion rate of the oligomers and the oxygen content in the atmosphere and with the same oxidant content the rate of combustion of oligoisobutene is appreciably lower than that of polyisobutene. However, oligoisobutenes are less flammable than polyisobutene owing to incomplete combustion of gasification products and to dilution with carbon dioxide evolved from carboxyl groups. 7 refs.

**073392 STATISTICAL CONFORMATIONS OF CYCLIC DIMETHYLSILOXANES.** Rotational-isomer-state models have been used to describe the statistical conformations of cyclic oligomers of dimethylsiloxane possessing 8-20 skeletal bonds. The results are compared with similar calculations made on linear-chain molecules of dimethylsiloxane. Cyclic dimethylsiloxanes,  $[(CH_3)_2SiO]_x$ , with  $x=4-10$ , appear to be relatively rigid, compared with their linear-chain counterparts, and their average shape is disc-like. For cyclic molecules possessing  $\geq 50$  skeletal bonds, the directional correlations between pairs of skeletal bonds approach those calculated for the corresponding open-chain molecules. (author abstract) 19 refs.

## Oxidation

**073393 STERIC EFFECTS ON THE CONTROLLED POTENTIAL ELECTRO-OXIDATION OF 3-METHYLTHIOPHENE AND THIOPHENE OLIGOMERS AND THE PROPERTIES OF THEIR POLYMER FILMS.** This investigation is concerned with the effect of thiophene monomer structures on the electrochemical behavior and physical characteristics of electropolymerized poly(thiophenes) and various poly(3-methylthiophenes). These variations in polymer structure were achieved by employing thiophene and 3-methylthiophene oligomers of different unit sizes and substitution patterns as the starting 'monomers'. The relative redox characteristics of the 'monomers' were deduced from the measured current maximum values of the electro-oxidation potentials. Electrochemical oxida-

tion of the monomer yields electrically conducting polymers that exhibit internal redox properties unique for each type of starting 'monomer.' Scanning electron micrographs of the oxidized films are shown. (Author abstract) 14 refs.

## Permeability

**073394 DIFFUSION OF SOLVENT VAPORS IN POLYMER NETWORKS BASED ON EPOXY OLIGOMERS.** The penetrability of polymer coatings by different aggressive reagents is one of the more important characteristics determining their effectiveness for anticorrosion protection. Coatings based on epoxy and phenol-formaldehyde oligomers have found wide application for the protection of metals from corrosion because of their strong adhesion to different surfaces, good deformation strength properties, and chemical resistance to aggressive reagents. Despite the high practical value of the protective epoxy phenol-formaldehyde coatings, data are practically unavailable in the literature on the influence of crosslink density on the sorption and diffusion of aggressive reagents in polymer networks. The authors, therefore, carried out an investigation of the kinetics of sorption of vapors of low-molecular-weight liquids in crosslinked polymers with different crosslink densities. 13 refs.

## Physical Properties

**073395 OLIGOMERIC CARBONOTHIOIC DIHYDRAZIDES FROM DIALDEHYDES AND CARBONOTHIOIC DIHYDRAZIDE.** This report describes the acid-catalyzed preparation of oligomeric ( $n=8$  to 10) (diylidene)carbonothioic dihydrazides from equimolar quantities of selected dialdehydes and carbonothioic solvents. The elemental analyses agree with carboxy/hydrazide termination. This is consistent with termination by traces of carboxyaldehyde in the dialdehyde or with terminal oxidation during isolation of the product, or both. 8 refs.

Wiley, Richard H. *J Macromol Sci Chem* v A25 n 2 1988 p 231-233.

**073396 AB INITIO CONFORMATION AND IONIZATION POTENTIALS OF POLYSILANE OLIGOMERS.** Ab initio results indicate no significant difference in total energy between the anti and gauche conformers in tetrasilane and the anti-anti and gauche-gauche conformers in pentasilane when basis set and electron correlation improvements are made. Our calculated EPT vertical ionization energies are in good agreement with experimental photoelectron spectra assuming an approximately equal mix of anti and gauche rotamers. Furthermore, these results support the idea that the highest occupied MO energy level of the larger silane oligomers will decrease as the backbone is transformed from an all-anti conformation to one with a larger gauche population. 22 refs.

**073399 ELECTROCHEMICAL POLYMERIZATION OF AN UNSATURATED ISOCYANATE-CONTAINING OLIGOMER.** The authors investigate the electrochemical polymerization of an unsaturated isocyanate-containing oligomer in solvents with different donor capacity (dimethylacetamide and acetonitrile) as a function of the concentration of the starting product, temperature and density of current. It is shown that in dimethylacetamide the polymerization of such an oligomer is accompanied by simultaneous conversion of the free isocyanate groups and unsaturated bonds with formation of an insoluble network polymer. (Edited author abstract) 3 refs.

Lipatova, T.E. (Acad of Sciences of the Ukrainian SSR, USSR); Matyushova, V.G.; Narazhaiko, L.F. *Polym Sci USSR* v 28 n 8 1986 p 1867-1873.

**073400 CYCLIZATION AND OXIDATION OF ISOPRENE OLIGOMERS DURING POLYMERIZATION ON KAOLINITE.** The structure of isoprene oligomers prepared by cationic polymerization on kaoline acid centers was studied by PMR and IR spectroscopic methods. It was shown that during polymerization the oligomer undergoes cyclization, forming two- and three-cycle structures by an intramolecular chain transfer reaction. The oligoisoprene is easily oxidized, with additional cyclization taking place simultaneously with oxidation. Oxidation leads to the formation of a great variety of oxygen containing groups. A system of PMR signal assignment is cyclized and oxidized oligoisoprene was developed. A method for the calculation of the structure of cyclized low-molecular weight oligoisoprenes from PMR spectroscopic data is presented. (Author abstract). 16 Refs.

## Research

**073402 OLIGOMER COMPATIBILITY BY CONTINUOUS THERMODYNAMICS.** In this paper the concept of continuous thermodynamics is applied to establish a simple calculation procedure for the number-average segment number. Instead of the well-known sums with respect to the species, integrals occur which, in the case of Schulz-Flory distributions, may be calculated analytically, leading to simple formulas for the cloud-point curve and the shadow curve. The method is applied to model calculations showing that the chosen Gibbs free energy function may account for the details of the liquid-liquid equilibrium of oligomer mixtures and to a real oligomer system taken from the literature. (Edited author abstract) 14 refs.

**073403 FORMATION OF RADICALS IN THERMOCHEMICAL TRANSFORMATIONS OF EPOXY OLIGOMERS FILLED WITH CARBON FIBERS.** The surface groups of the ECF not only have an important effect on the character of the processes which take place in the interphase region but also actively participate in them. The mechanism of the chemical reactions has not been definitively elucidated. Industrial 4,4'-isopropylidenediphenol (ED-20) and cycloaliphatic (UP-612) epoxy oligomers were studied. It is shown that although acceleration of the decomposition of the oligomer was observed in the early stages of heating, further heat treatment results in its slowing is also confirmation of the participation of Pb or its oxide in the formation of the structural network of the epoxy composite. This type of thermal decomposition is characteristic of composites with a disperse filler in the case of the reaction of the components and inclusion of heteroatoms in the polymer chain. 13 refs.

**073404 REACTIONS OF  $\alpha$ -OXIDES IN THE PRESENCE OF HEXAMETHYLENETETRAMINE AND GLYCERINE DIPHENYL ETHER.** Without a knowledge of the chemical processes taking place in systems containing  $\alpha$ -oxide compounds, HMTA, and alcohols it is difficult to suggest a structure for the hardened composition and to evaluate the actual activities in the condensation and hardening process. To provide objective information about the reaction scheme and the kinetics of reactions in which epoxide oligomers participate we studied a model reaction system. The model epoxide oligomer selected was phenyl glycidyl ether (PGE) and the  $\alpha,\gamma$ -diphenyl ether of glycerine (GDPE). Results of the isolation of reaction products and the establishment of the reaction scheme provided evidence of the predominance of oligoalkylation in the system examined. Semilogarithmic anamorphoses of the kinetic curves of  $\alpha$ -oxide consumption, obtained during determination of the concentration of PGE are presented. 9 refs.

**073405 MOLECULAR-MASS DISTRIBUTION OF LINEAR FORMALDEHYDE OLIGOMERS IN THE SYSTEM FORMALDEHYDE-WATER-ORGANIC SOLVENT.** The <sup>13</sup>C NMR method has been used to investigate the MD of linear formaldehyde oligomers in mixed solvents containing in addition to water an organic

component - DMSO, sulfolane or dimethylsulphone (up to 60 wt.%). The values of the equilibrium constants K<sub>j</sub> of formation of the j-mers (j = 2, 3, 4) have been determined. Addition of an organic component chemically inert in relation to formaldehyde to an aqueous solution of formaldehyde practically had no influence on the equilibrium between the oxymethylene glycols. (Author abstract) 9 refs.

## Rheology

**073406 RHEOLOGY OF HARDENED OLIGOMERS. ROLE OF WALL SLIDING.** A new problem in the rheology of polymers, i.e. flow of the hardened polymer with the appearance of sliding in the tube is analysed theoretically. The statement of the problem is discussed, the pressure-flow characteristic is calculated (in dimensionless variables), and the boundaries of stability and the conditions for the appearance of discontinuous hysteresis transitions are considered. A model case of isothermal steady-state motion of a hardened oligomer in a circular tube (channel) of radius R<sub>0</sub> is considered. Experimental data indicate that when the flow changes from large to small values the system passes consecutively through steady-states from the right hand branch of the curve  $\kappa(\omega)$  up to the extreme left hand point of the intermediate branch. On attaining this point, with further decrease in flow, a further abrupt transition occurs on the left hand branch corresponding to the piston flow. (Edited author abstract) 14 refs.

## Solutions

**073407 ACYLATION OF TERMINAL AMINO GROUPS IN THE SYNTHESIS OF POLY-M-PHENYLENEISOPHTHALAMIDE.** The reaction between terminal amino groups and dimethylacetamide in acid reaction solutions of PMPIA oligomers (or polymer) at elevated temperatures (80-90°C) has been investigated. The process takes place quantitatively and is catalyzed by the presence of hydrogen chloride. Similar relationships were obtained with m-phenylenediamine. The occurrence of the acylation reaction via decomposition of dimethylacetamide has been confirmed by polarographic analysis of the accumulation of dimethylamine in the system and by potentiometric titration of the consumption of hydrogen chloride in building up the dimethylamine which is liberated. 4 refs.

**073409 FAST ATOM BOMBARDMENT MASS SPECTROMETRY IDENTIFICATION OF OLIGOMERS CONTAINED IN POLYSULFIDES AND THEIR COMPLEXES WITH HEAVY METALS.** Fast atom bombardment mass spectrometry (FABMS) was used to identify cyclic oligomers formed in polycondensation reactions leading to aromatic, aliphatic, and aliphatic-aromatic polysulfides. Compounds with a molecular weight up to about 1500 daltons present in the crude polymers were detected without separation. Furthermore, the FABMS technique showed the formation of complexes between the cyclic sulfides contained in the extracted fraction from crude polymers and salts of heavy metals (Ag, Hg, and Cu). In some cases a selectivity of the  $\text{AgNO}_3$  toward cyclic sulfides of particular size was also observed. (Author abstract) 11 refs.

**073410 SEGMENTED OLIGO-ETHERURETHANE-UREAS WITH END AND INTRA-CHAIN URETHANE-UREA BLOCKS.** X-ray diffraction, differential scanning calorimetry and IR spectroscopy have been used to study segmented oligo-etherurethane-ureas, incorporating intra-chain and end rigid blocks of various lengths, as well as compounds modeling these blocks. It has been established that the oligomers are amorphous with a characteristic domain structure formed as a result of the microsegregation of the flexible and rigid blocks. The process of de-glassification of the associates of the different rigid blocks is accompanied by the appearance of corresponding endothermic peaks on the DSC curves. More intense endothermic peaks at higher temperatures are typical of the model compounds. (Edited author abstract) 10 Refs.

## Stability

**073411 GAS-PHASE REACTIONS OF OCTAVINYLSILASESQUIOXANE IN VACUO.** When sensitive films are sprayed in vacuo, varying amounts of residual gases ( $\text{O}_2$  and  $\text{H}_2\text{O}$ ), adsorbed by the support to which the film is being applied, are present, depending on the residual pressure. The reactions of these gases with the film of vinyl- $\text{T}_3$  can result during subsequent development in distortion of the resulting topological relief. For this reason, it is important to study the thermal stability of vinyl- $\text{T}_3$  in vacuo and its reactions with water and oxygen and to establish the conditions for its GLC analysis. The reaction of glass with vinyl- $\text{T}_3$  results in the formation of volatile gaseous products, corresponding to ion currents with  $m/z = 28, 31, 45, 62, 64, 78$ . It was found that the intensities of these ions are temperature-dependent. These results therefore enable conditions for the chromatography of oligoorganosilasesquioxane to be established. 10 refs.

**Structure** See Also ESTERS—Synthesis; POLYMERS—Stability; POLYMERS—X-Ray Analysis.

**073412 STRUCTURAL ORGANIZATION IN EPOXIDE OLIGOMERS AND POLYMERS.** A study of structure formations in epoxydiane oligomers of MM 340-10<sup>4</sup> by means of X-ray diffraction and IR spectroscopy has shown that bands sensitive to structure formations are present in oligomers. Low molecular weight epoxide oligomers with a high content of diphenylolpropanediglycidyl ether crystallize on holding for a long period. Ordering occurs in epoxide polymers of MM up to 10<sup>4</sup> with formation of micro-crystallites. The characteristic dimensions of the ordered regions are 100-150 Å.

**073413 POLY(DI-1,2-DIAZINEDIETHYLENE-1,2-DIOLS).** Oligomers of 2 to 9 units having a diazinediethylene-1,2-diol repeating unit have been prepared by a cyanide ion-catalyzed self-condensation of pyridazine-3,6-, pyrazine-2,5-, or pyrimidine-4, 6-dialdehyde. These are the first known representatives of a class of conjugated polymeric enediol materials derivable specifically from these three structurally related diazine dialdehydes. The oligomers, isolated as their potassium salts, are soluble in acid and base with an isoelectric point at pH 6.5. Of several possible methods evaluated for the preparation of the free dialdehydes, only that involving ozonization of the distyryldiazines was found to be of preparative value. (Edited author abstract) 18 refs.

**073414 STRUCTURAL STUDIES OF SEMI-FLUORINATED n-ALKANES. 3. SYNTHESIS AND CHARACTERIZATION OF  $\text{F}(\text{CF}_2)_n(\text{CH}_2)_m(\text{CF}_2)_n\text{F}$ .** A series of semifluorinated triblock oligomers of the form  $\text{F}(\text{CF}_2)_n(\text{CH}_2)_m(\text{CF}_2)_n\text{F}$  have been synthesized and characterized by thermal analysis and low-frequency Raman measurements. Only a single endotherm is observed for the series of F12HmF12 molecules corresponding to the crystalline melting point. In the limit of vanishing m, the melting point of  $\text{F}(\text{CF}_2)_{24}\text{F}$  has been predicted by extrapolation and compared with that which recently appeared in the literature. Low-frequency (30-330  $\text{cm}^{-1}$ ) Raman measurements revealed the presence of two bands attributable to the longitudinal acoustical mode oscillations (LAM) of the extended molecule. (Edited author abstract) 21 refs.

**073416 NORWEGIAN OLIVINE.** Norwegian olivine production has risen remarkably from barely 100,000 mt at the beginning of the 1970s to 2.8 million mt in 1986, primarily due to the success of A/S Olivin, the major producer, in researching and promoting new uses for the mineral. Norwegian olivine producers now account for 60% of Western world production, and they are the dominant suppliers to the world market. The traditional uses of olivine are for blast cleaning and in foundry sands, where its high melting point, good thermal conductivity, high heat capacity, and low coefficient of expansion make

it ideal as a casting medium. During the past decade, use of olivine as a slag conditioner in iron and steel making has been responsible for the huge growth in demand. In steel making, dolomite or limestone are the usual fluxing agents, with silica to lower the melting point. Olivine contains both magnesia and silica, so when used as a conditioner, it reduces the melting point of the charge and lowers the viscosity of the slag. It is an excellent substitute for dolomite when treating low silica ores.

**073418 MINIMIZING THE MAXIMUM DEVIATION OF JOB COMPLETION TIME ABOUT A COMMON DUE-DATE.** Given a set of n jobs with deterministic processing times and the same ready times, the problem is to find the optimal common due-date  $k^*$  and the optimal job sequences  $\sigma^*$  to minimize the maximum deviation of job completion time about the common due-date. It is shown that the problem can be formulated as an equivalent linear programming (LP) minimization problem. Using the strong duality property of LP, we derive the optimal due-date by considering the dual of the LP problem. When the optimal due-date is determined the optimal job sequence is readily available. After the theoretical treatment numerical examples are presented to demonstrate the validity of the theories. (Author abstract) 11 refs.

**073419 STOCHASTIC LEADTIMES IN TWO-LEVEL DISTRIBUTION-TYPE NETWORKS.** The paper analyzes a simple three-location, two-level distribution-type system with stochastic leadtimes with the objective of determining planned leadtimes which minimize the sum of expected inventory-holding and tardiness costs. In a manufacturing context, the system can be viewed as one in which common processing or procurement is done first, whereupon another manufacturing stage differentiates this common product. Within a distribution framework, the system is one in which material is transported to a central facility and subsequently transported to smaller local distributors or retailers. Two

heuristic policies are investigated which are simple adjustments to optimal solutions for serial systems resulting from a decoupling of the distribution network. Additional study results are discussed. (Edited author abstract) 8 refs.

**073420 OR IN GOVERNMENT.** The paper presents 2 initiatives where operations research (OR) has proven to play a key role. The idea in the Financial Management Initiative (FMI) is that government business will be improved by importing sound management principles and methods from the best in private sector business. The second initiative is the application of information technology.

Trumpington (Dep of Health & Social Security, Engl). *J Oper Res Soc* v 38 n 10 Oct 1987 p 907-912.

**073421 DISCRETE LOCATION MODEL WITH FUZZY ACCESSIBILITY MEASURES.** In many location problems especially those associated with social policies, non-crisply defined criteria are used such as, how 'near' or 'accessible' a facility is, or how 'important' certain issues are, etc. In these cases a fuzzy sets approach is more appropriate. This paper presents an application of the set partitioning (set covering with equality constraints) type of integer programming formulation to a discrete location problem with fuzzy accessibility criteria. (Edited author abstract) 6 refs.

**073423 MIXED PLANAR/NETWORK FACILITY LOCATION PROBLEMS.** Location problems that arise in real-world context often require the use of a modeling framework which has a mixture of planar and network components. Examples include: (i) the general plant layout problem, in which the plant consists of several arbitrarily shaped departments connected to each other via doors; (ii) warehouse location in cities and village, in which the Manhattan travel metric applies within cities, but networks of roads connect cities and villages; and (iii) facility location in older cities, in which older, unplanned sections are best modeled by a network representation, whereas newer, planned sections are best modeled via a Manhattan travel metric. The purpose of this article is to examine such a modeling framework for facility location. Properties of this new representation are developed, and the p-median problem is analyzed in this context. (Edited author abstract) 10 refs.

Batta, Rajan (State Univ of New York at Buffalo, Buffalo, NY, USA); Palekar, Udatia S. *Comput Oper Res* v 15 n 1 1988 p 61-67.

**073424 ESTIMATION OF DISTRIBUTION PARAMETERS ASSOCIATED WITH FACILITIES DESIGN PROBLEMS INVOLVING FORWARD AND BACKTRACKING OF MATERIALS.** The facilities design problem is one of the important cases of general quadratic assignment problems which involve the assignment of  $n$  facilities to  $n$  locations with the objective of minimizing total cost of the design. All  $n$  feasible solutions for a given problem of size  $n$  yield a frequently distribution

of total costs between lower and upper bounds. The estimation of distribution parameters, viz. mean and variance, allow the checking of the optimality of the different solutions. The methods used to calculate these parameters consider only forward movement of material. However in actual functional layouts the cost of transportation should include costs of both forward as well as backflow of material. This paper deals with the development of a general expression for determining the distribution parameters associated with the facilities design problems involving both forward and backflow of materials. (Edited author abstract) 22 refs.

**073426 GEOMETRICAL REPRESENTATIONS FOR MCDA.** In this paper geometrical representations for multicriteria decision problems are proposed. This new approach provides assistance to understand the conflictual aspects of the criteria and to tackle the problem of the weights associated to them. A generalized criterion, including a preference function, is first generated for each criterion. This allows to define unicriterion preference flows for which a geometrical representation can be obtained by using the Principal Components Analysis. This technique provides the decision-maker with a considerable enrichment for the understanding of his problem: clusters of actions can be considered, the importance of the criteria can be evaluated, conflictual criteria are immediately detected, incomparability between actions is emphasized and explained. (Edited author abstract) 7 refs.

**073428 FORECASTING DEMAND FOR MAIL ORDER CATALOGUE LINES DURING THE SEASON.** Most mail order catalogues include a large number of new lines. Forecasting demand is therefore not easy, and the forecasts for all lines are typically up-dated every week of the catalogue season. The forecasts for each line are usually obtained by determining how the demand for similar lines built up in the corresponding season of the previous year, and then grossing up the demands received accordingly. Using data for one particular mail order company, the sources of error in this trend profile method of forecasting are explored, and some simple ways of improving its accuracy are suggested. **073432 OR IN PRACTICE: RESULTS OF A SURVEY IN GREECE.** This paper presents results of a survey on the utilization of OR in tackling complex organizational and operational problems in the public and private sectors in Greece. The survey was addressed to the qualified OR and computer personnel, members of the corresponding scientific societies, and replies to questions concerning users, application areas, techniques used, results and related problems. The results of the survey presented in this paper show that, although OR utilization is expanding in Greek operational units, problems are often encountered which tend to minimize its pace of expansion. On the other hand it was shown that, wherever OR is utilized, practitioners are usually equipped with micros and the programming languages mostly used are COBOL, BASIC and FORTRAN, whereas a considerable number of OR studies, mostly in project planning, are carried out without any use of computer. (Edited author abstract) 17 refs.

**073434 FROM PROBLEM-STRUCTURING TO IMPLEMENTATION.** This paper is intended to encourage operations research/management sciences (OR/MS) practitioners to take seriously the notion that the implementation of their work deserves as much attention as do the technical aspects that underlie their recommendations. It focuses on the similarities between problem-structuring and implementation, and argues that an exploration approach can be used in both. It is now accepted that successful structuring must involve deliberate exploration of tangible and intangible issues, and the same is true of implementation. (Edited author abstract) 10 refs.

Pidd, Michael (Univ of Lancaster, Engl). *J Oper Res Soc* v 39 n 2 Feb 1988 p 115-121.

**073435 REOPTIMIZATION ALGORITHM FOR THE SHORTEST PATH PROBLEM WITH TIME WINDOWS.** The shortest path problem with time windows (SPPTW) occurs in the construction of vehicle routes and schedules for which time window constraints must be satisfied. The SPPTW is repeatedly solved to produce routes with disjoint schedules which form the solution of the original problem. The cost of repeatedly solving the SPPTW can be reduced by reusing part of the solution of the preceding problem. A primal-dual reoptimization method which runs in pseudo-polynomial time is proposed. It can solve problems with up to 2500 nodes. (Author abstract) 14 refs.

**073436 BATCH ACCEPTANCE COMPLEMENT METHOD FOR GENERATING RANDOM VARIABLES.** We present a new method called the 'batch acceptance-complement method for generating random variables' from a given density function. Some guidelines for application of this method are discussed. The authors also introduce an algorithm which is based on both M-2 on the MAC (Modified Acceptance Complement) method. This algorithm uses a truncated form of the geometric distribution and generated the random variables in batches. (Edited author abstract) 6 refs.

**073437 PRESIDENT'S SYMPOSIUM: THE CURRENT MISSIONARY ROLE OF OR/MS.** A major role of operations research and management science has always been to provide 'missionaries' to bring system perspectives, modeling, and analysis to those 'heathen' professions that have not yet been 'converted'. Since many of our traditional fields have already become self-sufficient, in the future our future attention should be directed at the more complex fields of organization theory and public policy, which have considerable needs and thus offer rich opportunities. The author provides some perspectives on these views 10 years later, at a time when rather dramatic changes are taking place in the structure and activities of the field. (Edited author abstract) 4 refs.

**073439 ON THE ACCURACY OF DEMAND POINT SOLUTIONS TO THE PLANAR, MANHATTAN METRIC, p-MEDIAN PROBLEM, WITH AND WITHOUT BARRIERS TO TRAVEL.** This article examines the accuracy of a frequently made assumption by urban planners in location analysis, namely, to restrict facility location to demand points. Theoretical, computational and empirical analysis reveal that in the absence of barriers to travel this is an excellent approximation for a well studied planar location problem which has wide applicability in an urban environment. In the presence of barriers to travel, our findings suggest that the set of demand points should be augmented with the set of barrier intersection candidate points to yield an approximation of the same overall quality. 2 refs.

**073440 SYSTEM DYNAMICS AND MICROWORLDS FOR POLICYMAKERS.** The paper reviews four major developments in the subject that have brought about this change. There have been improvements in the symbols and software used to map and model system structure. New ideas have been adopted from behavioral decision theory which help to transfer policymakers' knowledge into computer models. There have been improvements in methods of simulation analysis that enable modelers and model users to gain better insight into dynamic behavior. Greater emphasis has been placed on small transparent models, on games and on dialogue between 'mental models' and computer simulations. Together these developments allow modelers to create computer-based learning environments (or microworlds) for policymakers to 'play-with' their knowledge of business and social systems and to debate policy and strategy change. (Edited author abstract) 75 refs.

**073441 MINIMIZING EXPECTED MAKESPAN IN A TWO-MACHINE STOCHASTIC OPEN SHOP WITH POISSON ARRIVAL.** Longest expected processing time (LEPT) policy is a machine loading rule where out of all the jobs waiting to be processed by a machine, with their processing times following given probability distributions, the one with the largest expected processing time is chosen first. Using a method based on Markov process and dynamic programming, we show that a LEPT policy will minimize the expected makespan for a two-machine stochastic open shop with Poisson arrival for jobs. Processing time of any job at any machine is exponential. We assume that all jobs are identical but the two machines are not. (Author abstract) 21 refs.

**073442 INSTITUTE FOR OPERATIONAL RESEARCH: AN INITIATIVE TO EXTEND THE SLOPE OF OR.** One of the aims in forming the Institute for Operational Research (IOR) in 1963 was to expand the fields of application of OR and to reverse the tendency, then evident, for it to settle down as a mainly in-house, industrial activity deriving its strength from mathematics and the hard sciences, with little research content of its own. The paper outlines the early work done at IOR in pursuit of this mission, especially in multi-organizational settings such as city and regional planning, health services and the building industry. This leads into discussion of the conditions under which the work was done, the style of 'action-research' that evolved, its influence at the time,

and its relevance to the different circumstances of the present day. (Author abstract). 35 Refs.

Friend, John K. (Tavistock Inst of Human Relations, Engl); Norris, Michael E.; Stringer, John. *J Oper Res Soc* v 39 n 8 Aug 1988 p 705-713.

**073443 SOME METHODOLOGIES FOR COMMUNITY OPERATIONAL RESEARCH.** As experience of conducting community OR projects grows and learning accrues, new approaches will be developed offering guidance on how best to proceed in alleviating the problems of community organizations. In the interim, it is sensible to consider which, if any, among the existing OR and systems methodologies might prove useful for this kind of work. In this paper it is argued that there already exist, within what might be described as 'enhanced OR', a number of approaches which are suitable for guiding community OR practice. This is demonstrated by outlining some of these methodologies, giving examples of their use with community organizations and showing their particular strengths in the community context. Some conclusions are drawn about the community OR enterprise. (Author abstract). 34 Refs.

**073444 PROCEDURE FOR LOCATING EMERGENCY-SERVICE FACILITIES FOR ALL POSSIBLE RESPONSE DISTANCES.** The problem of locating emergency-service facilities involves the assignment of a set of demand points to a set of facilities. One way to formulate the problem is to minimize the number of required facilities, given that the maximum distance between the demand points and their nearest facility does not exceed some specified value. We present a procedure for determining the numbers of such facilities for all possible values of the maximum distance. Computational results are presented for a microcomputer implementation. **073445 ON THE DISTRIBUTION OF ACTIVITY TIME IN PERT.** In PERT analysis the activity-time distribution is assumed to be a beta distribution, and the mean and variance of the activity time are estimated on the basis of the 'pessimistic', 'most likely' and 'optimistic' completion times, which are subjectively determined by an analyst. In this paper, on the basis of the study of the PERT assumptions, we present an improvement of these estimates. It is also shown that, by means of additional reasonable assumptions, the activity-time distribution in PERT analysis may be essentially simplified. (Author abstract). 24 Refs.

**073447 ASYMPTOTICALLY EFFICIENT ALLOCATION RULES FOR THE MULTIARMED BANDIT PROBLEM WITH MULTIPLE PLAYS - PART I: I.I.D. REWARDS.** The authors address a version of the multiarmed bandit problem with multiple plays. At each instant of time it is necessary to sample a fixed number  $m \geq 1$  out of  $N$  i.i.d. (independent and identically distributed) processes whose distributions belong to a family

suitably parameterized by a real number  $\theta$ . The objective is to maximize the long-run total expected value of the samples. Following T.L. Lai and H. Robbins (1985), the learning loss of a sampling scheme corresponding to a configuration of parameters  $C = (\theta_1 \times \theta_N)$ ,  $N$  being the number of the machine's arms, is quantified by the regret  $R_n(C)$ . This is the difference between the maximum expected reward at time  $n$  that could be achieved if  $C$  were known and the expected reward actually obtained by the sampling scheme. A lower bound is provided for the regret associated with any uniformly good scheme, and a scheme which attains the lower bound for every configuration  $C$  is constructed. The lower bound is given explicitly in terms of the Kullback-Liebler number between pairs of distributions. 7 refs.

**073448 ASYMPTOTICALLY EFFICIENT ALLOCATION RULES FOR THE MULTIARMED BANDIT PROBLEM WITH MULTIPLE PLAYS - PART II: MARKOVIAN REWARDS.** The multiarmed bandit problem is studied when the reward statistics are Markovian and given by a one-parameter family of stochastic transition matrices  $P(\theta) = [P(x, y, \theta)]$ ,  $\theta \in R$ , and  $x, y, \in X$ , where  $X$  is contained in  $R$  is a finite set of rewards. There are  $N$  arms with parameter configuration  $C = (\theta_1 \times \theta_N)$ . Successive plays of arm  $j$  result in  $X$ -valued random variables  $Y_{j1}, Y_{j2}, \dots$ , whose statistics are given by  $P(\theta)$ . The first play of an arm has a reward distribution which need not be the invariant distribution. It is necessary at each stage to play  $m$  arms. The aim is to maximize in some sense the total expected reward for every parameter configuration. 8 refs.

## Analogies

**073449 ANALYSIS OF VALVE MODELS FOR SOLUTION OF DISCRETE OPTIMIZATION PROBLEMS IN OPERATIONS RESEARCH.** The author considers a class of circuits consisting only of diodes, voltage sources, current sources and ideal transformers and used as models of discrete optimization problems which are solved in operations research. An analysis is made of the electric processes in these circuits. An analytic method is proposed for their design. The methods are of practical interest since they avoid the need to set up electric models and measure the voltages and currents in them. They also enable the prerequisites to be created for a search for more effective computer algorithms. Modeling of the general linear programming problem is treated by an example covering valve converter schemes. (Edited author abstract) 6 refs.

**073450 SUPERCOMPUTERS AND OR.** As supercomputers become more accessible to the operations research (OR) community (both here and in the USA), their influence on OR is expected to grow. Increased availability of supercomputers could be the single factor that would have the greatest impact upon research into large-scale systems. Using supercomputers could be classified as: near-term: increasing the scale size of current models; experimenting with parallel computing steps in current solution procedures; improving the accuracy of current computations; trying larger Monte Carlo and simulation runs on current models; and long-term: developing genuinely parallel models and using parallel solu-

tion techniques on them; developing parallel simulation models; developing parallel algorithmic techniques; developing real-time models. 55 refs.

**073451 PRESIDENTS' SYMPOSIUM: GEORGE E. KIMBALL, A PIONEERING GIANT IN OPERATIONS RESEARCH.** These remarks, adapted from a talk given at the April 1985 TIMS/ORSA meeting in Boston, are aimed at sustaining the memory of George Elbert Kimball, one of the operations research's influential pioneers, who himself was president of the Society from 1964 to 1965. George Kimball's contributions to operations research were diverse and fundamental. The sophistication he displayed in developing method or problem analysis was usually characterized by its simplicity, by his capacity to get to the heart of the question. When George Kimball died in 1967, at age 61, he was already working on computer games and self-learning systems. (Edited author abstract) 3 refs.

**073452 USER-ORIENTED OPERATIONS RESEARCH SOFTWARE.** Significant advances in computer hardware and software have prompted the accelerated development of operations research (OR) software. Recently, a widespread interest has emerged in the design of user-oriented model-user interfaces that make existing OR methodologies readily available to practitioners. The feasibility of these systems has created new dimensions in the development of model generators that facilitate the use of OR techniques. This paper describes several programs that take advantage of some of the features of the microcomputer to assist the user of data input and editing, error detection in data entry, as well as model generation. The software illustrates different levels of ease of learning and use, modeling flexibility, and assistance to the user in the modeling effort as well as in interactive decision making. It also illustrates different levels of user-program interaction. (Author abstract) 7 refs.

**073455 GRAPHICAL-STRUCTURE-BASED MODELS FOR ROUTING PROBLEMS.** This paper presents an approach to the modelling of routing problems, focusing on the manner in which circuitous flow and conservation of flow are defined. The new modelling approach employs graphical constructs to define circuit requirements and allows a better description of real-world problems. Graphical constructs allow greater latitude than do existing modelling constructs, which can be inadequate and computationally inefficient. The flexibility and adaptability of graphical-structure-based models allows inclusion of balance constraints for typical routing problems. A hierarchical development, which makes use of the graphical structures employed in the model, is outlined for obtaining exact solutions. (Author abstract). 18 refs.

## Medical Applications

**073456 PREDICTING THE IMPACT OF INSTITUTING A PRIORITY READMISSION POLICY IN NURSING HOMES.** This paper utilizes a computer simulation model written in FORTRAN to predict the impact of changing a nursing home policy regarding the reservation of beds for Medicaid patients sent to the hospital for a stay of up to 20 days. The model assumes that the policy would be eliminated (beds would not be held open) and that what were formerly bed reservation patients would have priority over all others seeking admission to the nursing home. The output variables of primary interest are the average waiting time in the hospital to return to the nursing home, the average queue size for patients waiting to return, and the maximum number of days such that at least 95%(90%) of the patients will have been able to return within that time period. (Author abstract) 11 refs.

## Military Applications

**073457 SOME ASPECTS OF OPERATIONAL ANALYSIS IN THE MINISTRY OF DEFENCE.** The paper starts by describing what types of operational analysis (OA) are undertaken, and goes on to discuss the management of this OA, in terms of the coordination of the many studies, the types of expertise sought in the personnel who undertake the work, and the balance between intramural and extramural activity. It then addresses more technical matters: the problems of coping with many potential scenarios, the problems associated with data uncertainty, the problems of selecting output measures, the problems of choosing between OA methods, the problems of validating studies of a postulated major war, and the problems associated with generating cost data. ## Scheduling

**073461 SCHEDULING JOBS WITH FIXED START AND END TIMES.** We analyze a scheduling problem in which each job has a fixed start and end time and a value. We describe an algorithm which maximizes the value of jobs completed by  $k$  identical machines. The algorithm runs in time  $O(n^2 \log n)$ , where  $n$  is the number of jobs. We also show that the problem is NP-complete under the following restriction: Associated with each job is a subset of the machines on which it can be processed. For a fixed number of machines  $k$ , an  $O(n^{k+1})$  time algorithm is presented. (Author abstract) 13 refs.

Arkin, Esther M. (Stanford Univ, Stanford, CA, USA); Silverberg, Ellen B. *Discrete Appl Math* v 18 n 1 1987 p 1-8.

**073462 ONE-MACHINE SCHEDULING WITH ALLOCATION OF CONTINUOUSLY-DIVISIBLE RESOURCE AND WITH NO PRECEDENCE CONSTRAINTS.** The efficiently solved one-machine scheduling problems with no precedence constraints are generalized to the case with allocation of continuously-divisible constrained nonrenewable resource. Models of operation are assumed to be duration versus resource amount linear functions. The following optimality criteria are considered: maximum completion time, maximum lateness, maximum cost and weighted sum of completion times. For the problems discussed polynomial-time algorithms are found. (Author abstract) 3 refs.

Janiak, Adam. *Kybernetika* v 23 n 4 1987 p 289-293.

**073463 POLYNOMIAL ALGORITHMS FOR PROBLEMS IN THE THEORY OF SCHEDULING ON 'NARROW' NETWORKS.** An acyclic network, the vertices of which are covered by a small number of oriented chains will be called 'narrow with respect to the vertices' or simply 'narrow.' The minimum number of such oriented chains is identical to the number  $n$  of chains in Dilworth's minimum expansion for vertex comparability. We consider problems of constructing an optimal schedule for a narrow network  $G$  with vertices-operations  $E_i$ . 11 refs.

Al'berton, I.B. *Sov J Comput Syst Sci* v 25 n 3 May-Jun 1987 p 82-92.

**073464 INTEGRATION OF PRIORITY DISPATCHING AND DUE-DATE ASSIGNMENT IN A JOB SHOP.** A simulation study to investigate the effect on missed due-dates and job flow-time is discussed by combining the job dispatching and due-date assignment decisions in job shop scheduling. A 'semi-local' due-date-oriented dispatching rule is designed which is able to monitor the progress of jobs closely. The performance of the dispatching rule is enhanced by a rational due-date assignment procedure which takes account of both job content and shop status information in determining due-dates. The simulation results show that the combined scheduling procedure performs better than some common simple dispatching rules which are used with the total-work-content (TWK) due-date assignment method. (Author abstract). 11 refs.

Cheng, T.C.E. (Univ of Manitoba, Winnipeg, Manit, Can.). *Int J Syst Sci* v 19 n 9 Sep 1988 p 1813-1825.

**073465 JOB SHOP SCHEDULING WITH UNIT TIME OPERATIONS UNDER RESOURCE CONSTRAINTS AND RELEASE DATES.** We consider the problem of job shop scheduling with  $m$  machines and  $n$  jobs  $J_i$ , each consisting of  $l_i$  unit time operations. There are  $s$  distinct resources  $R_h$  and a quantity  $q_h$  available of each one. The execution of the  $j$ -th operation of  $J_i$  requires the presence of  $u_{ijh}$  units of  $R_h$ ,  $1 \leq i \leq n$ ,  $1 \leq j \leq l_i$ , and  $1 \leq h \leq s$ . In addition, each  $J_i$  has a release date  $r_i$  that is  $J_i$  cannot start before time  $r_i$ . We describe algorithms for finding schedules having minimum length or sum of completion times of the jobs. Let  $l = \max\{l_i\}$  and  $u = \max\{u_{ijh}\}$ . If  $m$ ,  $s$ ,  $u$  and  $l$  are fixed, then both algorithms terminate within polynomial time. (Author abstract) 5 refs.

**073466 CRYOPUMPS: CURE FOR IR COATING HEADACHES.** The advantages of using cryopumps in producing infrared coatings are discussed. Cryopumps are constructed of materials resistant to most acids and have no moving parts exposed to particulate contaminants. Compared to a turbomolecular pump of the same size, the cryopump's much higher pumping speed enables it to reach process pressure in far less time, and to hold a lower process pressure. Problems with backing mechanical pumps are eliminated entirely because the cryopump is a 'hold-up' pump that does not require a backing pump. Other topics include cost-saving features, stopping toxic gases, and regeneration.

## Ceramics

**073472 PREPARATION OF WAVELENGTH-SELECTIVE REFLECTORS BY SOL-GEL PROCESSING.** The present letter reports attempts to prepare, by the sol-gel method, a multilayer, relatively narrow band reflector. A wavelength of 650 nm was chosen for the reflector. Multilayer stacks (up to 13 layers) were built up of alternating  $TiO_2$  and  $SiO_2$  coatings. Individual sols serving as sources of  $SiO_2$  and  $TiO_2$  were prepared from

silicon tetraethoxide and titanium isopropoxide. The layers were deposited (alternately) on thoroughly cleaned soda-lime glass discs by the spin-coating technique. Each layer, after deposition, was heat-treated at 450°C for 10 min. 6 refs.

## Chemical Vapor Deposition

**073473 STUDY ON THE OPTICAL AND ELECTROCHROMIC PROPERTIES OF POLYCRYSTALLINE WO<sub>3</sub> THIN FILMS PREPARED BY CVD.** Polycrystalline WO<sub>3</sub> thin films were prepared by annealing, under various conditions, of black or reflective tungsten layers produced by CVD on fused quartz or SnO<sub>2</sub> coated substrates. The optical gap was investigated and found to depend on film thickness. It varies from approx. 2.5 eV for the thicker films to 3.1 eV for the thinner films. The values of the electrochromic efficiency, using protons as inserted ions, varies between 30 and 40 cm<sup>2</sup>/C for all kinds of films and depends on the film preparation and the coloring-bleaching cycle. Coloring and bleaching times and response of the films are also found to be enhanced with cycling and influenced by the preparation conditions. (Author abstract) 38 Refs.

## Contamination

**073474 APPLYING CRYOGENIC PUMPS TO OPTICAL COATING SYSTEMS.** One of the methods of improving film quality in general is to reduce contamination in the coating system, and one of the possible sources of contamination in any coating system is the pumping system. Many pump technologies involve the use of hydrocarbons, which in turn can be the source of contamination in a deposition process. The author examines various pump technologies in common usage and discusses the various factors which enter into the selection of pumps to reduce contamination during deposition.

## Fabrication

**073476 STUDY OF NEAR-IR TRANSPARENT, HIGH CONDUCTIVE Si-Ag-Si COATINGS PREPARED BY DC MAGNETRON SPUTTERING USING TWO S-GUN.** Near-IR transparent, high conductive Si-Ag-Si coatings are deposited by dc magnetron sputtering using two S-gun. The parameters of multilayer are designed and optimized. Si-Ag-Si coatings with arbitrary thicknesses are sputtered-deposited by means of a simple control method. The optical, electrical and mechanical properties of samples are given. (Author abstract) 3 Refs. In Chinese.

## Mathematical Models

**073477 WAVELENGTH-INDEPENDENT ANTI-INTERFERENCE COATING FOR THE FAR-INFRARED.** The transmission and reflection of radiation at an interface between two dielectrics with a thin conducting film is analyzed under conditions appropriate to the far-infrared. When the transmission is from a more dense to a less dense optical medium it is demonstrated that the reflectivity can be made arbitrarily small for a wide range of wavelengths by selecting the appropriate sheet resistance for the conducting film. This property can be exploited to produce a coating that drastically reduces the interference fringes in a flat plane-parallel dielectric substrate or window. The condition depends only on the film resistance which can be monitored precisely during deposition. (Edited author abstract) 9 refs.

**073478 NEAR-IR SURFACE IMPEDANCE OF THIN METALLIC FILMS WITH UNLIKE SURFACES.** A simple formula is proposed for the near-IR surface impedance of thin metallic films with unlike surfaces. It is derived from a previous N-directional model based on the Reuter and Sondheimer anomalous skin effect theory. The relative precision on the surface resistance thus calculated is found to be a few times 0.1% at wavelengths smaller than or about 2 μm. Anisotropy may easily be introduced into the electron relaxation time to treat the polycrystalline case or (and) into the Fuchs electron-surface scattering parameters. (Author abstract) 25 refs.

## Monitoring

**073479 OPTICAL MONITORING OF NONQUARTERWAVE STACKS.** Three methods of monitoring nonquarterwave stacks are investigated: the turning value method, the inflection point method, and the second-harmonic method. The advantages of these methods are that they are monochromatic and that they do not rely on any absolute measurements of transmittance during monitoring. Computer simulations of the deposition process are performed for different nonquarterwave stacks to check the accuracy of the three methods, and we investigate whether these methods can compensate for errors in thickness occurring during deposition. (Author abstract) 6 refs.

## Performance

**073480 DIAMOND-TOUGH COATINGS: HAS THE SPARKLE DULLED?** Early in the '80s, there was excitement over the prospect of applying film layers that transmit perfectly and could protect their substrates from physical or chemical abuse. It would be the ideal film for optical as well as mechanical applications. Over 20 years earlier there was some excitement generated by the occasional occurrence of CVD films of carbon forms that possessed unusual hardness and chemical resistance. These films, based on forms of carbon, have been described according to their structure or deposition process as diamond-like carbon (DLC), i-carbon (for ion-processed), hard carbon, and transparent carbon. More recent developments and improvements are reported. 3 refs.

Pellicori, Samuel F. *Photonics Spectra* v 21 n 10 Oct 1987 p 165-166, 168.

## Radiation Effects

**073481 NONLINEAR BEHAVIOUR OF OPTICAL COATINGS SUBJECTED TO INTENSE LASER IRRADIATION.** Optical filters subjected to intense laser irradiation can experience changes in their optical properties due to nonlinearities in the optical constants of their materials. The origin of the nonlinearity can be due to the dependence of refractive index on temperature or electric field. A simulation of both cases has been developed and is presented here. The model is then applied to two particular designs, showing that reflecting components can be turned into transmitting devices if sufficient input power is used. The result is relevant to the case of high-energy laser mirrors to rugate filters. (Author abstract) 9 Refs.

**Spectrum Analysis** See MAGNESIUM COMPOUNDS—Thin Films.

## Stability

**073482 ELECTRIC-FIELD-ASSISTED DEPOSITION OF OPTICAL COATINGS.** It is possible to improve the stability of optical coatings if an electric field is applied during deposition. A.c. and d.c. electric fields have been used in the preparation of narrow-band filters consisting of ZnS and cryolite layers and edge filters of ZnS and MgF<sub>2</sub>. As a result, the shift in the wavelength of prominent features in the spectral transmittance is reduced considerably even for coatings subjected to 100% relative humidity. (Author abstract) 5 refs.

## Testing

**073483 REAL-TIME INTERFEROMETRIC TESTING OF OPTICAL SURFACES.** Various methods for precise testing of the surface geometries are reviewed. Integrating modern microcomputer and laser technology, a computer-linked Twyman-Green interferometer with real-time processing of the digitized interferogram data was conceived. For visual inspection, this instrument can easily be switch-converted to a Fizeau interferometer. Phase sampling interferometry proved to be of particular advantage. It is a method of establishing surface topology from the intensities for several values of the reference phase through the determination of the sample phases. 10 refs.

Merkel, Klaus. *Jena Rev* v 32 n 2 1987 p 60-64.

**073484 FEL OPTICS COATING TEST DEVICE.** A crucial issue concerning FEL is the resistance of the mirrors to high flux. In the example of the ACO storage ring the high X-ray flux of spontaneous emission sets a limit to the shortest wavelength. A detailed analysis of the resistance of multilayer dielectric TiO<sub>2</sub>/SiO<sub>2</sub> mirrors has been carried out. Several degradation processes have been identified occurring at different energies of incident photons leading to either surface or bulk absorption. This data was very important for the operation of the FEL at wavelength above 460 nm. (Edited author abstract) 4 refs.

**073485 STABILISATION SPECTRALE DES DEPOTS OPTIQUES EN COUCHES MINCES.** [Spectral Stabilization of Thin Film Optical Coatings]. Knowledge of the spectral derivatives of the reflectance R of a thin film optical coating permits a better understanding of their influence on the reflectance. Consequently, one can

modify these derivatives to change the shape of the spectral reflective curve. In particular, the canceling of successive spectral derivatives determines a coating with a flat broad band reflectance. In this paper, general equations are given to calculate the first and second spectral derivatives whatever the optical thicknesses of the layers. Derivatives with higher orders are also obtained when the coating is antireflective or when the layers are in  $\lambda/4$  configuration. Conditions relating thicknesses and indices are given to achieve broad-band coatings. Simple  $\lambda/4$  coatings up to four layers are studied; explicit equations are obtained linking the reflectance  $R_0$  and the indices of the layers for a given value of  $R_0$ . (Author abstract) In French. 13 refs.

**073486 INCREASING THE EFFECTIVENESS OF COMMERCIAL LASER DAMAGE TESTING.** Failure of the thin-film coatings on the optical elements of high-power production laser systems frequently limits achievable performance. Laser manufacturers now require optics with the most durable coatings; as a result, routine laser damage testing has become an essential tool for production and procurement of reliable optics. A demand for fast turnaround and low unit-test cost paced the emergence of such testing from the research laboratory into the high-volume production environment. Conventional manual damage testing methods are labor intensive and slow, therefore, test automation is the key to effective high-volume testing. 19 refs.

**073487 AUTOMATIC DESIGN OF OPTICAL COATINGS WITH CALCULATED RATE OF FINISHED PRODUCTS AS THE END MERIT INDEX.** A new automatic design method of optical thin film systems is presented, in which the effect of the errors in monitoring of optical multilayer coatings on the performance is considered. The merit function in the design involves not only the optical properties but also the rate of finished products of the multilayer coatings by computer simulation, and the highest rate of finished products is taken as the end optimization goal. The thin film systems designed by this method not only satisfy the requirement of optical properties but also have larger manufacture tolerance. Hence, this method will be very effective in production. Some examples of the designs of broad-band and double-band antireflection coatings are given. The results of such designs are satisfactory. **073490 ION-ASSISTED DEPOSITION: IAD IS SLOWLY MOVING TOWARD LIMITED PRODUCTION.** While researchers have studied ion-assisted deposition (IAD) of thin films for more than a decade, IAD for coating commercial laser optics has only recently moved into limited production use. Commercially, the addition of IAD to the coating process for laser optics has only peaked the interest of the optical coating industry within the last year or two. Perhaps a handful of optical coating firms are now using the process for production. Interest in IAD for commercial use is keen, however, because the process promises to improve many of the characteristics of optical coatings at very little added cost. 50 refs.

**073493 RAMAN CHARACTERIZATION OF OPTICAL THIN FILM COATINGS.** A simple oblique-incident method for suppressing substrate interference and enhancing Raman sensitivity is discussed. Using this method, Raman spectroscopy on different types of titania films is shown to be a sensitive technique for probing the microscopic structures of thin films and characterizing submicron thin film coatings. With Raman spectroscopy, ion-beam-sputtered and electron-beam-evaporated coatings, when exposed to heat or laser light, are found to crystallize into different polycrystalline structures. The rate of crystal growth may be investigated with in situ Raman scattering. Using zirconia films as an example, polarization analysis of Raman scattered light can be used to discern the state of crystallinity of the film and to enhance the sensitivity of detection of low-frequency Raman modes. **073498 COMPARISON BETWEEN PHOTON COMMUNICATION SYSTEMS AND QUANTUM COHERENT COMMUNICATION SYSTEMS.** This paper clarifies properties of the quantum state control communication systems such as the quantum coherent communication systems (QCCS) and the photon communication systems (PS). We compare properties of these two systems in the case of uncoded and coded schemes. In the former case, the energy-information efficiencies of both systems are given, taking into quantum state control account, and the Fano factor of PCS which corresponds to the same performance to the ideal QCCS is given. In the latter case, the reliability functions of both systems are considered. As a result, it is shown that effects of error correcting code in the PCS are much larger than that in the QCCS. (Author abstract) 18 refs.

**073499 OPTISCHER UEBERLAGERUNGSEMPFANG - EINE UEBERSICHT.** [Coherent Optical Transmission - a General View]. In contrast to conventional optical direct receivers, coherent optical receivers enable a basically novel scheme for optical transmission techniques. By evaluating until now almost neglected coherence properties of light sources, it is possible to increase the receiver sensitivity of an optical transmission link up to a factor of 1000, which enables a drastic increase of the repeater spacing. Furthermore, it is possible to introduce coherent frequency division multiplexing similar to the well-known broadcasting techniques. This allows a substantial improvement of the transmission capacity in future optical transmission systems. In German. 38 refs.

**073505 OPTICAL COMPUTING.** In principle, optical fibers can carry signals with bandwidth in excess of one terahertz over a 1 km distance. In practice, however, the bandwidth of fiber optic communication systems is much less than this because of the bandwidth restrictions of optoelectronic interfaces and electronics for signal processing. This is evident in three related types of fiber optic communication systems: a simple point-to-point fiber optic link, a fiber optic network and a photonic switch. In each case, an electronic or optoelectronic bottleneck exists that is unrelated to the fiber's transmission capacity.

Anon. *Photonics Spectra* v 22 n 1 Jan 1988 p 107-108, 110.

**073506 TIME CHARACTERISTICS OF AN OPTICAL SIGNAL IN A COMMUNICATIONS CHANNEL WITH SCATTERING.** The scattering processes that accompany the propagation of light pulses in open information channels lead to time blurring of a signal. Here in a direct channel (the optical axis of the radiator is directed toward the receiver) the time blurring of a pulse results from the influence of multiply scattered radiation; in over-the-horizon communications channels, where information is transmitted precisely through scattering, the principal contribution to time blurring is introduced by singly scattered radiation. 8 refs.

**073507 TERABIT LIGHTWAVE NETWORKS: THE MULTIHOPE APPROACH.** For multiuser communications networks, lightwave technology offers the potential to supply a pool of capacity- to be shared among users - far above that provided by any alternative technology. However, the bandwidth limitation of the electro-optic converters needed to attach each user to the optical medium prevents any one user from accessing more than a tiny fraction of the overall capacity. This paper discusses the problems with conventional approaches for tapping the capacity contained within the optical communications band. It then proposes a new network architecture that permits tapping lightwave's vast capacity potential without requiring a technological breakthrough. With this approach, it becomes possible to create networks that offer hundreds of thousands of gigabits-per-second total capacity, to be shared among users, each limited to a peak rate of 1Gb/s. (Author abstract) 12 refs.

**073509 IMPLICATION OF VERY WIDE FIBER BANDWIDTH FOR NETWORK ARCHITECTURE.** The basic premise of this article is that at some point in the future all the transmission facilities of the public (telephone) network will be fiber-optic, i.e., end-to-end fiber connectivity will be provided to each subscriber. With the advent of coherent transmission systems the available bandwidth will become enormous, and thus the question we address is: given the availability of 'infinite' bandwidth to every subscriber in the relatively near future, what does this imply for the network architecture? Having discussed advantages and disadvantages of architectures based on different switching technologies, we conclude that an architecture based on circuit-switched, fixed-bandwidth channels for the transport of user information is the most appropriate for a network in which there are no constraints on the transmission bandwidth. The standard channel capacity should be determined by the service having the greatest bandwidth requirement. (Edited author abstract) 13 refs.

**073511 FIBRES, PHOTONS AND THE FUTURE.** The optical fibre transmission systems enjoying widespread application today are very simple in form and are basically limited to transmitting information over large distances. The electrical information, in whatever form it is available, is fed into a suitable transducer, which could be a light-emitting diode or a semiconductor laser, to produce a modulated optical output which is launched into the optical fibre. The optical part of the system is rather simple and primitive, consisting of a light source, fibre transmission line and a detector. The bandwidth available depends on details of the fibre structure. The launched beam normally comprises rays at all angles within the acceptance cone, with the result that the geometrical path travelled by a ray depends on its angle to the axis. The effect of multipath, or multimode, dispersion can be greatly reduced by introducing an appropriate variation of refractive index in the core. These are discussed in the paper, along with optical fibre cables, optical signal processing, fibre lasers, and other aspects of the subject.

**073514 CROSSTALK IN A TWO-CHANNEL COHERENT FIBRE-OPTIC ASK SYSTEM USING AN OPTICAL AMPLIFIER AND NON-NEGLECTIBLE LINEWIDTH LASERS.** We present measurements of crosstalk penalties in a two-channel ASK system using 1.55  $\mu\text{m}$  DFB lasers and a semiconductor laser amplifier. The amplifier was operated well below gain saturation. No additional receiver sensitivity penalty due to the amplifier was observed for single channel operation. However, the additional crosstalk in the amplifier required a 10% increase of the channel spacing compared to the spacing in the nonamplifier system. (Author abstract) 8 refs.

**073519 AVAILABILITY REQUIREMENT FOR FIBER OPTIC TRANSPORT SYSTEMS IN DISTRIBUTION FEEDER APPLICATIONS.** This paper contains a discussion of Bellcore's proposed channel availability requirement for fiber optic transport systems used in distribution feeder applications. A representative model of the distribution network is first constructed which includes a high capacity fiber optic system running to a distribution hub. An overall availability requirement, consistent with present availability requirements, is applied to this model. The allocation to the fiber system is determined by truncation of the current interface channel availability requirement which is prorated with distance. Further allocation of downtime to the electronic hardware reliability failures yields an objective that can be directly compared with the results of electronic hardware reliability models. This requirement is now included in Bellcore's proposed 'Generic Reliability Assurance Requirements for Fiber Optic Transport Systems.' (Author abstract). 7 Refs.

**073520 WAVEFORM DISTORTION EVALUATION FOR OPTICAL CPFSK HETERODYNE TRANSMISSION.** Waveform distortion of a continuous-phase frequency-shift keyed (FSK) signal due to fiber chromatic dispersion is measured. The transmission spacing is estimated to be 100 km at 5 Gb/s with 1.55- $\mu\text{m}$  wavelength. The results of a 2-Gb/s optical CPFSK heterodyne detection transmission experiment is reported. Since there is no chirping degradation, it is possible to transmit the signal through a 200-km single-mode fiber. 4 refs.

**073521 TECHNIQUES FOR MULTIGIGABIT COHERENT OPTICAL TRANSMISSION.** It has been anticipated that the main roles for coherent optical techniques will be to provide increased capacity both for long-haul transmission and wideband signal distribution. This could be achieved by the combination of high-data-rate transmission and fine-grain wavelength-division multiplexing. To this end, heterodyne detection experiments have recently been extended into the gigabit regime, but difficulties not present at lower data rates have been encountered. A range of technical solutions to these problems are discussed, including broadband receivers, homodyne detection, and phase-diversity reception, and the current status of each of these is reviewed. 59 refs.

Smith, David W. (British Telecom, Ipswich, Engl). *J Lightwave Technol* v LT-5 n 10 p 1466-1478.

**073522 LONG-DISTANCE GIGABIT-RANGE OPTICAL FIBER TRANSMISSION EXPERIMENTS EMPLOYING DFB-LD'S AND INGAAS-APD'S.** High-speed and long-distance transmission characteristics have been examined at 1.2, 2, and 4 Gb/s using mesa structure DFB-DC-PBH LD (laser diode) transmitters and planar InGaAs APD (avalanche photodiode) receivers. High receiver sensitivities, -40 dBm at 1.2 Gb/s, -37.4 dBm at 2 Gb/s, and -32.4 dBm at 4 Gb/s, have been obtained with high-speed and low-noise InGaAs APD/FET receiver circuits. Long-span transmissions, 1.2-Gb/s over 170 km, 2-Gb/s over 141 km, and 4-Gb/s over 120

km at 1.55  $\mu\text{m}$ , and 4-Gb/s over 74 km at 1.3  $\mu\text{m}$ , have been performed. Power penalties caused by the LD wavelength chirping in the 1.5- $\mu\text{m}$  wavelength region and error-rate flooring caused by the LD side-mode oscillation in the 1.3- $\mu\text{m}$  wavelength region are discussed. 18 refs.

**073524 ANALYSIS OF CHIRP POWER PENALTY IN 1.55- $\mu\text{m}$  DFB-LD HIGH-SPEED OPTICAL FIBER TRANSMISSION SYSTEMS.** In a 1.55- $\mu\text{m}$  high-speed transmission system using a distributed-feedback laser diode (DFB LD), the chirp effect in the LD is a factor limiting transmission span length. In order to evaluate the chirp effect, expressions for the chirp power penalty are derived for two cases: the chirp occurring in both edges of the pulse and in the whole time of the pulse. The calculations based on the results of the LD chirp measurement predict that the chirp effect will be significant above 2 Gb/s even if the zero dispersion wavelength of fiber is shifted to the 1.55- $\mu\text{m}$  band. Transmission experiments performed at 1.2 Gb/s and 2.4 Gb/s verify this prediction. 18 refs.

**073525 HIGH-SPEED PICOSECOND OPTICAL PULSE COMPRESSION FROM GAIN-SWITCHED 1.3- $\mu\text{m}$  DISTRIBUTED FEEDBACK-LASER DIODE (DFB-LD) THROUGH HIGHLY DISPERSIVE SINGLE-MODE FIBER.** Picosecond optical pulse compression characteristics of chirped pulses from gain-switched distributed-feedback laser diodes (DFB-LD) transmitting through highly dispersive media are studied theoretically and experimentally. It is clarified theoretically that gain-switched chirped pulses can be compressed to about a 0.7-time-bandwidth product by normal dispersion of the dispersive media and that the optimum dispersion value to obtain a minimum compressed pulse is proportional to the square of original pulsewidth. Through a dispersion-shifted single-mode fiber with -48 ps/nm normal dispersion at a 1.3- $\mu\text{m}$  wavelength, gain-switched 30-ps (full width half maximum) pulses from a directly modulated 1.3- $\mu\text{m}$  DFB-LD at a 4.4-GHz repetition rate have been successfully compressed to 6.4-ps optical pulses with a 0.8 time-bandwidth product. Experimental results agree with the theoretical analysis. 42 refs.

**073526 THEORETICAL PERFORMANCE OF DIRECT DETECTION OPTICAL COMMUNICATION WITH ALGAS LASER TRANSMITTERS, AVALANCHE PHOTODIODE DETECTORS, AND COLOR-CODED PPM SIGNALING.** Theoretical performance characteristics are presented for a direct detection optical communication system that has peak-power-limited laser diode transmitters and avalanche photodiode photodetectors. The signal format consists of the transmission of a group of L binary source digits as a single light pulse at one of N nonoverlapping optical center frequencies (colors) in one of M possible time slots.

The system achieves a given received symbol error probability at lower peak signal intensities with a less complicated receiver structure than can be obtained with an ordinary pulse position modulation system of the same alphabet size and source data rate. 31 refs.

**073527 MAXIMUM ENTROPY METHOD FOR LIGHTWAVE SYSTEM PERFORMANCE EVALUATION.** A constrained maximum entropy criterion is used to approximate the cumulative distribution function of the photocurrent generated by an avalanche photodiode in response to an incident information-bearing optical signal. The approximate distribution, derived from known moments of the photocurrent, is used to evaluate the probability of error in direct detection lightwave systems. In this application, the results of the maximum entropy method are equivalent to those of a Gauss quadrature rule method. However the maximum entropy method exhibits a relative efficiency in terms of the required number of moments of the photocurrent. 15 refs.

Cartledge, John C. (Queen's Univ, Kingston, Ont, Can). *J Lightwave Technol* v LT-5 n 11 p 1613-1617.

**073528 IMPROVED ERROR PROBABILITY EVALUATION METHODS FOR DIRECT DETECTION OPTICAL COMMUNICATION SYSTEMS.** The problem of average error probability evaluation for direct-detection binary optical communications in the presence of avalanche gain, intersymbol interference, and colored additive Gaussian noise is considered. Tight new upper and lower bounds, together with a modified Gaussian quadrature rule based on approximate moments, are derived and evaluated. The bounds are found to be much tighter than the Chernoff bound though only slightly more complex to evaluate, and can be used as approximations to the error probability in most cases of practical interest. Taken together the new bounds and the modified Gaussian quadrature rule form a comprehensive set of performance evaluation tools offering a judicious balance between complexity and accuracy. 33 refs.

**073529 SYSTEM DESIGN FOR OPTICAL PPM COMMUNICATIONS WITH DIODE COMBINING.** The most efficient way to encode laser diodes for maximum data rate is studied. Three different system architectures are considered, with combining achieved by dichroic mirrors operating in conjunction with a pulse-position-modulated (PPM) format. The basic criterion is to maximize the data rate with increasing number of diodes, while maintaining diode power constraints and decoding bit error probability. The three systems are: (1) power combining into a single pulse, followed by PPM encoding; (2) parallel channels, in which each diode is separately PPM encoded; and (3) color coding, in which diodes are encoded over a common wavelength-time slot alphabet. Data rate equations are presented as a function of the number of diodes, mirror combining losses, PPM alphabet size, and the operating optical signal-to-noise ratio. 14 refs.

**073531 ADVANCED COHERENT LIGHTWAVE TECHNOLOGIES.** The present state of optical coherent communication technologies, covering optical heterodyne/homodyne detection and optical frequency division multiplexing (optical FDM), is discussed. Included is a description of the development history of coherent lightwave communication technology followed by a discussion of heterodyne detection for future long-haul high-speed systems. A description of optical coherent transmission systems using heterodyne/homodyne detection is presented along with a review of optical FDM technology and its applications. Future trends are examined. 8 refs.

Nosu, Kiyoshi (NTT, Yokosuka, Jpn). *IEEE Commun Mag* v 6 n 2 Feb 1988 p 15-21.

**073532 FACTORS AFFECTING FIBER-OPTIC TRANSMISSION QUALITY.** Important factors related to further improvement and extension of optical-fiber transmission system performance are discussed, focusing on repeater spacing, data rate, and optical frequency utility. Relevant progress in optical-fiber loss, semiconductor laser properties (such as output power, spectrum, and modulation speed), low-noise broad-band photodetectors, and optical-frequency multiplexers/demultiplexers are reviewed. 61 refs.

**073533 INFLUENCE OF DIRECTLY MODULATED DFB LD SUB-MODE OSCILLATION ON LONG-SPAN TRANSMISSION SYSTEM.** Error-rate floors have been observed in several long-span transmission experiments at 500 Mb/s, using 1.5- $\mu$ m distributed-feedback laser diodes (DFB LDs) and 1.3- $\mu$ m zero dispersion optical fibers. It is proposed that for the threshold gain difference between main and submode (for DFB LDs),  $\Delta\alpha$  is a good parameter to specify the submode oscillation characteristics. It is experimentally and theoretically confirmed that the threshold gain difference  $\Delta\alpha$  must be greater than 5-6 cm<sup>-1</sup>, to avoid the error rate floor at 500 Mb/s. It was also confirmed that  $\lambda/4$  phase-shifted DFB LDs can easily satisfy this condition. 9 refs.

**073534 FORWARD ERROR CORRECTION IN DISPERSION-LIMITED LIGHTWAVE SYSTEMS.** A rate 0.964 forward error correcting (FEC) code is integrated into the low-speed tributaries of a 565-Mb/s lightwave system as an exploratory system design approach toward relaxing requirements on laser sources in dispersion-limited operation. Experimental and simulation studies show that FEC can increase allowed spectral width up to 70% and wavelength offset up to 60%, at 565 and 1200 Mb/s. FEC is shown to qualify a mode-hopping, nearly single-mode laser for use at 1200 Mb/s, under conditions that otherwise prohibit use of this laser due to a severe error-rate floor. By virtually removing error rate floors, regardless of their cause, FEC is shown to provide an increasing advantage in conditions of greater degradation and to be effective against mode partition noise (MPN), mode jumping, and reflection impairments. The experimental FEC code is implemented in a standard gate array. The FEC code is described and its performance is analyzed. A new system design strategy is suggested for low-cost gigabit lightwave systems using FEC. 26 refs.

**073535 BAUD RATE RESPONSE: CHARACTER-**

**IZING MODAL DISPERSION FOR DIGITAL FIBER OPTIC SYSTEMS.** A method of characterizing modal dispersion in optical fibers, for baseband digital applications, is developed. Pulse distortion due to modal dispersion is simulated using modal transfer functions and pseudorandom pulsetrains. The extent of the distortion at given baud rates is identified with eye diagrams. Received optical power penalties are calculated from eye diagrams for a spectrum of baud rates, resulting in a penalty-versus-baud rate function called a baud rate response (BRR). Three useful parameters are derived from the BRR. The BRR magnitude parameter and shape parameter are used to accurately calculate a fiber's modal-dispersion power penalty for any given baud rate. The maximum baud-rate length product provides a mechanism for specifying modal dispersion quality among fibers. Together, these three parameters provide a means of characterizing modal dispersion for digital applications. The BRR method appears to be more accurate, and provides greater insight into fiber performance, than conventional methods. 10 refs.

Harris, Dan O. (North Carolina State Univ, Raleigh, NC, USA); Jones, J. Richard. *J Lightwave Technol* v 6 n 5 May 1988 p 668-677.

**073536 NEW METHOD ANALYZING EYE PATTERNS AND ITS APPLICATION TO HIGH-SPEED OPTICAL TRANSMISSION SYSTEMS.** An advanced method of analyzing eye patterns is proposed which plots the eye pattern as a function of the error rate. This eye-pattern analysis method can reveal low-probability phenomena accurately and presents information on the eye margin. The method is applied to high-speed optical-transmission systems and its usefulness is confirmed. Degradation of eye opening due to noise and intersymbol interference is investigated quantitatively using the 10<sup>-10</sup> BER eye. An automatic gain-control system is evaluated from a viewpoint of eye margin, and a gain control system having an improved eye margin performance is proposed. Low-probability abnormal phenomena, such as turn-on fluctuations and mode partitioning in directly modulated distributed feedback (DFB) lasers, are observed using this method. Transmission characteristics for a directly modulated DFB laser and an externally modulated DFB laser using a Ti:LiNbO<sub>3</sub> Mach-Zehnder modulator are also investigated at a bit rate of 4 Gb/s. It was discussed that there is no degradation for the 10<sup>-11</sup> BER eye opening after transmission over 580-ps/nm dispersive fiber, using external modulation. The eye margin design guide using the 10<sup>-11</sup> BER eye is also presented. 12 refs.

**073538 INPUT POWER LIMITS OF SINGLE-MODE OPTICAL FIBERS DUE TO STIMULATED BRILLOUIN SCATTERING IN OPTICAL COMMUNICATION SYSTEMS.** Stimulated Brillouin scattering (SBS) limits the optical power that can be transmitted through a single-mode fiber in long-distance optical communication systems, the authors have investigated SBS gain and threshold characteristics with amplitude-shift-keying (ASK), frequency-shift-keying (FSK), and phase-shift-keying (PSK) modulated lights, to estimate the input power limitation set by SBS. It was shown that maximum fiber-input powers or the SBS thresholds for fixed-pattern (1010 ...) ASK, FSK, and PSK modu-

lated lights are 2, 4, and 2.5 times higher, respectively, than the threshold for unmodulated light. Theoretical predictions were experimentally verified by SBS gain measurements with FSK and PSK modulated lights. The first direct observation of SBS with FSK modulated light pumping is also described. 25 refs.

**073548 EVALUATION OF CROSSTALK PENALTY IN MULTICHANNEL ASK HETERODYNE OPTICAL COMMUNICATION SYSTEMS.** The bit error rate (BER) of a two-channel ASK heterodyne lightwave system employing envelope detection is evaluated analytically. The result is used to calculate the power penalty resulting from intrachannel crosstalk. The theory predicts a minimum channel spacing of three times the bit rate if the design criterion is to keep the crosstalk penalty below 0.1 db. The minimum channel spacing increases to five times the bit rate for multichannel systems when crosstalk from the nearest neighbors on both sides is included. (Edited author abstract) 5 refs.

**073550 OPTICAL HOMODYNE RECEIVER WITH A SIX-PORT FIBRE COUPLER.** The performance of a PSK optical homodyne system based on a six-port fiber coupler, which avoids the need for an optical 90° hybrid device, is determined. Depending on the actual receiver implementation using the coupler, the receiver sensitivity is shown to be about 0.5-3 db from ideal and local laser excess intensity noise can be cancelled. (Author abstract) 7 refs.

Stephens, T.D. (Telecom Australia Research Lab, Clayton, Aust); Nicholson, G. *Electron Lett* v 23 n 21 Oct 8 1987 p 1106-1108.

**073551 APPLICATION OF COHERENT OPTICAL TECHNIQUES TO BROADBAND NETWORKS.** The potential advantages of applying coherent optical fiber techniques to broadband networks are reviewed, and a

number of system types are described to illustrate the operating principles. Particular consideration is given to networks that rely on the use of optically tunable lasers either to define a source frequency or to select a channel from a frequency-multiplexed transmission using the heterodyne receiver technique. (Author abstract) 11 refs.

**073553 INTERMODULATION DISTORTION IN OPTICAL AMPLIFIERS FROM CARRIER-DENSITY MODULATION.** We present a theoretical model describing the generation of intermodulation products (IMPs) in semiconductor optical amplifiers by signal-induced carrier-density modulation. The IMPs depend strongly on the linewidth-enhancement factor and the ratio of output intensity to the saturation intensity of the amplifier. Calculation of the total intermodulation penalty for multichannel amplifier applications is possible using the expressions presented. (Author abstract) 8 refs.

## Australia

**073556 GENERAL FEATURES OF THE ROUTE.** The growing need for telecommunications services and the emerging of digital transmission as an economic preference are being satisfied to an increasing extent by the use of optical fibers. The first Australian intercapital route to employ this technique is the Melbourne-Canberra-Sydney route. This short article outlines the history of long distance telecommunication in Australia and gives a

general description of this latest optical communication project.

Reynolds, Rodney (Telecom Australia, Aust). *Telecommun J Aust* v 37 n 3 1987 p 3.

**073557 TELECOMMUNICATION REQUIREMENTS - THE DECISION ENVIRONMENT AND OUTCOMES.** Few technologies have gained acceptance and grown faster in sophistication and application than that of optical technology. The capacity times distance product of optical systems has been doubling each year and future upgradability is now estimated to be some 50 to 100 times that of today's systems. This however was not so clear early in the 1980s. The author describes the research studies which resulted in selection of optical fiber technology for the Australian national telecommunication infrastructure.

Burton, J.; Mount, R.; Nowotny, G. *Telecommun J Aust* v 37 n 3 1987 p 5-10.

**073558 PLANNING FOR THE DEVELOPMENT OF THE ROUTE.** In early 1984, a Telecom Planning Committee was set up to examine the options available for the next phase of development for the Melbourne-Sydney route. The Committee found that optical fiber cable equipped with high capacity digital systems operating at 140 Mbit/s and 565 Mbit/s provided the most economic and technologically appropriate solution. (Author abstract)

Burton, J.; Piltz, D. *Telecommun J Aust* v 37 n 3 1987 p 11-14.

**073559 SYSTEM DESIGN AND EQUIPMENT SPECIFICATION.** The system design of the Melbourne-Canberra-Sydney SMOF route took place over the period 1984 to 1987 during which dramatic advances in cable and equipment performance occurred. The final savings in reduced equipment quantities were substantial. The design stages are outlined. (Edited author abstract)

Dempsey, R.; Faulks, B. *Telecommun J Aust* v 37 n 3 1987 p 65-67.

## Computer Simulation

**073560 COMPUTER SIMULATION OF HIGH-BIT-RATE OPTICAL FIBER TRANSMISSION USING SINGLE-FREQUENCY LASERS.** Chirp-induced dispersion penalties in high-bit-rate optical fiber transmission are assessed using numerical integration of laser rate equations and a Fourier transform fiber dispersion routine. The roles of the imposed modulation waveform and laser design parameters are evaluated from computer generated eye diagrams and simple analytical observations. Consistent with experimental data, the authors find device-dependent optimum laser extinction ratios. In addition, they address the delicate balance between nonlinear chirp-induced dispersion penalties and the speed limitations imposed by linear current filtering on both the laser transmitter and the receiver. These considerations become increasingly important at higher bit rates such as 8 Gb/s. 11 refs.

Corvini, P.J. (AT&T Bell Lab, Holmdel, NJ, USA); Koch, Thomas L. *J Lightwave Technol* v LT-5 n 11 p 1591-1595.

**073561 CHROMATIC DISPERSION LIMITATIONS IN COHERENT LIGHTWAVE TRANSMISSION SYSTEMS.** Computer simulation is used to evaluate the chromatic dispersion limitations for both various coherent lightwave transmission systems and direct-detection on-off keying (OOK) systems. The results show that for a 2-dB dispersion penalty the maximum modulation rate ranges from 5 to 9 Gb/s for systems operating at 1.55  $\mu\text{m}$  with 15 ps/km-nm of chromatic dispersion and 100 km of fiber. The effect is less severe for OOK systems and most severe in coherent detection systems. Simulation results are in agreement with available experimental data. 13 refs.

## Design

**073564 700 Mbit/s PSK OPTICAL HOMODYNE SYSTEM WITH BALANCED PHASE LOCKED LOOP.** An optical PSK homodyne system has been established in the laboratory. The highest transmitted bit rate, limited by the BER measurement equipment, is 700 Mbit/s. The required number of effective photons per bit is 18, at a bit rate of 140 Mbit/s, and a BER of  $10^{-9}$ . The balanced optical phase locked loop shows high stability, even in a very noisy environment. (Author abstract) 4 refs.

Fischer, Georg (Technische Univ Muenchen, Munich, West Ger). *J Opt Commun* v 9 n 1 Mar 1988 p 27-28.

**073565 USING SPREAD-SPECTRUM IN A HIGH-CAPACITY FIBER-OPTIC LOCAL NETWORK.** A local fiber-optic communications network capable of supporting tens of thousands of simultaneous users, each requiring on the order of 10-Mb/s continuous data rate, is proposed. The system uses coherent optical techniques to fully utilize the vast bandwidth offered by single-mode optical fibers (tens of thousands of GHz) a spread-spectrum technique is used to circumvent the problem caused by the instabilities of present-day semiconductor lasers. These include difficulty in reliably setting a laser's frequency with an accuracy better than several hundred GHz, and phase noise in the laser output, which would otherwise result in excessive amounts of interference among the various users. The method proposed is a variant of code-division multiple access (CDMA) that is called random-carrier (RC) CDMA, since the modulated carriers can be assumed to be completely randomly placed in the available optical band. 14 refs.

**073568 EFFECT OF LASER PHASE NOISE ON A CLASS OF BIT-RATE LIMITER.** Serious bit-error-rate limitations arise due to laser phase fluctuations in a class of all-fibre bit-rate limiters. Polarisation-sensitive error-rate floors exceeding  $10^{-6}$  have been observed in the passbands of these devices when driven by intensity-modulated GaInAsP lasers using non-return-to-zero signalling and direct detection. A similar decline in performance is anticipated in other fibre systems containing multiple paths. (Author abstract) 4 refs.

**073572 CASCADED INLINE SEMICONDUCTOR LASER AMPLIFIERS IN A COHERENT OPTICAL FIBRE TRANSMISSION SYSTEM.** A coherent optical transmission system with two broadband inline optical amplifiers was investigated. The main cause of system degradation was the generation of an interfering signal owing to backward scattered waves in the amplifier chain. The perturbation was eliminated by an isolator or sufficient attenuation between both amplifiers. It is possible to convert the effective 30 db gain of both amplifiers fully into an increase of the transmission span. (Author abstract) 6 refs.

**073573 CPFSK COHERENT OPTICAL RECEIVERS: IMPACT OF IF BANDWIDTH AND LASER PHASE NOISE.** A theoretical model for narrowband CPFSK receivers is presented. It accounts for the influence of if bandwidth on the signal voltage, non-Gaussian statistics of the output noise, correlation between noise samples stemming from limited if bandwidth, and the impact of laser phase noise. It is found that the if bandwidth needed to avoid intersymbol interference is 2.2 times the bit rate for a modulation index of 1; it is higher for other modulation index values. The bit error ratio is within 1 db of the shot noise limit for the modulation index of 1. (Edited author abstract) 6 refs.

## Mathematical Models

**073575 VIDEO TRANSMISSION IN OPTICAL FIBER COMMUNICATION SYSTEMS USING PULSE FREQUENCY MODULATION.** A design procedure has been developed to determine the required operating conditions for a pulse-frequency modulation (PFM) system (modulation index, required system bandwidth, and receiver carrier-to-noise ratio (CNR) for a specified receiver SNR (signal-to-noise ratio) and number of clicks per second. The PFM processing gain (= SNR/CNR) was measured to be 40 dB for a modulation index of  $\beta = 2.5$ , which agrees closely with the theory. The theoretical processing gain advantage of PFM over FM is 15.9 dB for a modulation index of  $\beta = 2.5$  with receiver bandwidth  $B_{rx} = 50$  MHz. 9 refs.

## Microwaves

**073576 . FIBER-OPTIC TRANSMISSIONS OF MICROWAVE 8-PHASE-PSK AND 16-ARY QUADRATURE-AMPLITUDE-MODULATED SIGNALS AT THE 1.3- $\mu$ m WAVELENGTH REGION.** Transmissions of a 6-GHz 8-phase phase-shift-keyed (8 $\phi$ -PSK) signal over a 12.5-km single-mode fiber with a 5-dB power margin and bit-error-rate (BER) of  $10^{-10}$  and a 6-GHz 16-ary quadrature-amplitude-modulated (QAM) signal over the same distance with a 2-dB power margin and BER of  $10^{-12}$  were demonstrated. The 8 $\phi$ -PSK digital modem operated at 78 Mb/s and the 16-QAM digital modem operated at 90 Mb/s. A high-speed multimode InGaAsP laser diode and a high-speed p-i-n diode were used in both fiber-optic transmission systems. Floor characteristics and power penalties observed in the BER performances of both systems were found to be caused by the intensity noise of the laser diode, particularly the reflection-induced intensity noise. 25 refs.

**073581 FREQUENCY STABILIZATION OF FDM OPTICAL SIGNALS ORIGINATING FROM DIFFERENT LOCATIONS.** Frequency stabilization of FDM optical signals to a comb of equally spaced frequencies has been demonstrated for optical signals originating from different locations. The results was achieved by locking each optical source to a resonance of a separate fibre Fabry-Perot cavity. The Fabry-Perot's comb of resonances was synchronised by locking all these devices to a master reference. Implementation of the frequency stabilisation circuit requires, at each location, a tunable fibre Fabry-Perot resonator, a photodetector and simple electronics. Such a simple circuit provides the means to frequency-stabilise a large number of FDM optical sources originating from different locations, as in a star network. (Author abstract) 4 refs.

**073585 THEORY OF CONTROL MECHANISM FOR AN OPTICALLY TIME-DIVISION-MULTIPLEXED SYSTEM.** The problem of phase control in a synchronous bit interleaved optical transmission system network is addressed theoretically and a practical implementation demonstrated. Control information is derived from the amplitude and phase of a discrete frequency component of the interleaved data spectrum, and it is shown that control is possible with a system penalty of less than 0.2 db. (Author abstract) 3 refs.

Lord, A. (British Telecom Research Lab, Ipswich, Engl); Blank, L.C.; Boggis, J.M.; Bryant, E.; Stallard, W.A. *Electron Lett* v 24 n 1 Jan 7 1988 p 29-31.

**073586 SIMPLE MULTIPLEXING METHOD FOR PULSED ANALOG SIGNAL AND DIGITAL SIGNAL IN OPTICAL COMMUNICATIONS.** There is a need for simultaneous optical transmission of two distinct signals, broadband analog video signal, and digitalized PCM voice signal or digital data signal, such as in TV transmission. Conventional multiplexing methods such as FDM, TDM, and WDM, can be applied, but some problems remain to be solved. This paper proposes a simple multiplexing method for a pulse analog signal and digital signal, which are multiplexed in different directions, time and amplitude. The proposed method is analyzed both by theory and simulation, and it is shown that with very slight deterioration of the analog signal, the multiplex transmission of digital signals with good quality can be obtained. (Edited author abstract) 11 refs.

**073590 TECHNIQUE DE MULTIPLEXAGE POUR RESEAU OPTIQUE DE VIDEOCOMMUNICATION.** [Multiplexing Techniques for Fiber Optic Video-communication Networks]. The paper describes the building of the subscriber equipment for a fiber optic local cable network. Three signals are multiplexed on the user access: video, digital audio and an ISDN channel. The multiplexing procedure is matched to a video signal in an analogue format likely to evolve towards the digital format of the future. This procedure is based on the properties of the video signal: the periodicity of a line structure and the availability of a time slot between active sections of the video lines. (Author abstract) In French. 11 refs.

**073592 BIDIRECTIONAL MULTICHANNEL 1.44 Gbit/s LIGHTWAVE DISTRIBUTION SYSTEM USING SUBCARRIER MULTIPLEXING.** We demonstrate a bidirectional lightwave distribution system that uses subcarrier multiplexing to transmit data to eight nodes from a single head-end laser. Data for each node (180 Mbit/s) and return data (45 Mbit/s digital video) are transmitted as FSK subcarriers, between 2.5 and 5.0 GHz. Penalties from laser nonlinearities, interchannel interference or bidirectional transmission are negligible. (Author abstract) 8 refs.

## Noise, Spurious Signal

**073595 INTERFEROMETRIC CONVERSION OF LASER PHASE NOISE TO INTENSITY NOISE BY SINGLE-MODE FIBRE-OPTIC COMPONENTS.** The intrinsic phase noise of semiconductor lasers is interferometrically converted into high levels of intensity noise by reflections at single-mode connectors and other fiber-optic components. This noise can have significant adverse impact on both direct detection and coherent transmission systems, causing bit-error-rate floors in extreme cases. (Author abstract) 7 refs.

Choy, M.M. (Bell Communications Research Inc, Red Bank, NJ, USA); Gimlett, J.L.; Welter, R.; Kazovsky, L.G.; Cheung, N.K. *Electron Lett* v 23 n 21 Oct 8 1987 p 1151-1152.

**073596 EFFECT OF MODAL NOISE ON SINGLE MODE FIBER OPTIC NETWORKS.** Modal noise may arise in single mode fiber optic networks from the random coupling of the fundamental mode LP<sub>01</sub> and the higher order mode LP<sub>11</sub>. The higher mode LP<sub>11</sub> is generated in the fiber optic link from imperfect connectors. A model for the modal noise generated in a single mode fiber optic network consisting of a number of connectors or splices is presented. The effect of modal noise on the link is

discussed and expression for signal to noise ratio has been obtained. Suggestions for the reduction of modal noise are given. (Author abstract) 11 refs.

**073597 CALCULATION OF ERROR PROBABILITY FOR OPTICAL FIBER COMMUNICATION SYSTEMS BY EDGEWORTH SERIES EXPANSION.** The exact calculation of error probability for a direct-detection optical fiber communication system is difficult because of the formidable characteristics of the shot noise induced by a filtered doubly stochastic Poisson process. This paper applies Edgeworth expansion method to calculate the exact error rate in the presence of shot noise and thermal noise. Numerical examples are given by using typical system parameters. Also, the calculations of this method are compared with the results obtained by the previously proposed Gram-Charlier series expansion method and the simple Gaussian Approximation. (Author abstract). 12 Refs.

**073598 EVALUATION OF POWER PENALTY DUE TO BEAT NOISE INDUCED BY CONNECTOR REFLECTION.** Power penalties caused by beat noise in a received optical signal beam were evaluated experimentally and theoretically. It was found that power penalties could be suppressed when the beam relative intensity noise was reduced to less than  $+MIN@135$  dB/Hz below 2.4 Gbit/s. This goal can be satisfied using a commercially available physical contact optical connector, which has less than  $-20$  dB reflection. (Author abstract). 4 Refs.

## Optimization

**073599 COMPARATIVE SENSITIVITY OF OPTIMAL DIGITAL OPTICAL COMMUNICATIONS SYSTEMS.** The optimal-design problem has been solved for digital optical communications systems (DOCS). The parameter of the optical signal of the transmitting device (spectrum width, radiation pulse duration) and a graded optical waveguide (profile shape and difference  $\Delta$  between indices of refraction of core and sheath) are considered as the system parameters to be varied. The length of a repeater section of the DOCS is taken as the optimality criterion. Optimal values are obtained for the varied parameters and the comparative sensitivity of the optimality criterion has been investigated in the presence and absence of intersymbol interference at the receiver for two wavelength bands, 0.85 and 1.3  $\mu$ m. (Author abstract) 5 refs.

Makkaveev, V.I.; Petrova, N.N. *Radioelectron Commun Syst* v 30 n 9 1987 p 1-5.

**073600 OPTIMIZATION OF COHERENT OPTICAL HOMODYNE SYSTEMS.** In the present paper coherent optical transmission systems (ASK and PSK) with homodyne detection will be optimized in regard to a minimum bit-error-rate (BER). By calculating the BER the laser phase noise, the additive Gaussian noise, the influence of the baseband filter on both noise terms and the intersymbol interferences are accounted for. The optimizable system parameters are identified as the PLL bandwidth, the bandwidth of the baseband filter and the decision threshold. It will be shown that the optimal filter bandwidth and the optimal threshold in ASK systems, in contrast to PSK systems, are dependent on the laser phase noise. The calculation of the optimal system parameters will be done exactly and by useful approximations. (Author abstract). 5 Refs.

## Performance

**073601 OPTICAL FSK TRANSMISSION SYSTEM USING A PHASE-DIVERSITY RECEIVER.** A coherent optical transmission system has been demonstrated using commercial DFB lasers as both transmitter and local oscillator. A receiver sensitivity of  $-51.8$  dbm was measured at a data rate of 140 Mbit/s. The system employs FSK modulation and a three-port, phase-diversity receiver. The effect of source linewidth on receiver bandwidth requirements has been examined. (Author abstract) 7 refs.

Pettitt, M.J. (STC Technology Ltd, Harlow, Engl); Remedios, D.; Davis, A.W.; Hadjifotiou, A.; Wright, S. *Electron Lett* v 23 n 20 Sep 24 1987 p 1075-1076.

**073602 OPTICAL SELF-HOMODYNE DPSK TRANSMISSION AT 1 AND 2 GBIT/S OVER 86 KM OF FIBRE.** Optical self-homodyne DPSK transmission has been achieved at 1 and 2 Gbit/s data rates with respective receiver sensitivities of  $-34.4$  dbm and  $-32.4$  dbm at  $10^{-9}$  BER. No dispersion penalty was observed after transmission through 86 km of optical fibre with 17 ps/ $\mu$ m/km dispersion at the operating wavelength of 1.53  $\mu$ m. (Author abstract) 7 refs.

Giles, R.C. (AT&T Bell Lab, Holmdel, NJ, USA); Reichmann, K.C. *Electron Lett* v 23 n 22 Oct 22 1987 p 1180-1181.

**073603 OPTICAL FIBRE LINE SYSTEM FOR  $4 \times 140$  MBIT/S, A NEW 565 MBIT/S APPLICATION.** Optical fiber systems offer an economically advantageous alternative in cases where large amounts of information have to be transmitted. In order to meet the need for high-capacity transmission systems within the CEPT hierarchy Ericsson has adapted its optical fiber line system for 56 Mbit/s to the requirements of the CEPT market. The system is designed for traditional telecommunications transmission with a capacity of 7680 telephone channels or one-way distribution of up to eight cable-TV channels and is entirely in accordance with the CCITT recommendation for 140 Mbit/s standard interface. Transmission takes place over single-mode fibers at a wavelength of 1300 or 1500 nm. 26 db system attenuation can be bridged, which corresponds to a repeater spacing of 40 and 70 km, respectively. The authors describe the design, construction and performance of the system. (Author abstract) 5 refs.

**073604 NOVEL ALL-ELECTRICAL SCHEME FOR DYNAMIC SEMICONDUCTOR LASER-TO-FIBRE COUPLING CONTROL.** An all-electrical scheme to maintain the optimum coupling condition in semiconductor laser-to-fiber coupling is described. A small deviation ( $\epsilon$ ) of the optimum laser-to-fiber distance severely degrades the laser performance in terms of, for example, output power, longitudinal mode spectrum and pulse response. The scheme employs the electrical noise of the laser as a distance sensor in a control loop that maintains the optimum laser-to-fiber distance in the presence of thermal or mechanical disturbances. (Author abstract) 7 refs.

**073617 PHASE-INSENSITIVE ZERO-F COHERENT OPTICAL SYSTEM USING PHASE SWITCHING.** We present a simple technique wherein phase-insensitive zero-IF coherent optical detection is achieved by imposing a periodic phase modulation on the transmitted signal. With differential phase shift keying (DPSK), this

can be achieved by adding a square wave to the phase modulator drive voltage. A single branch receiver is used, avoiding the doubling of receiver hardware needed with conventional phase diversity techniques. The performance of this scheme is analysed and compared to that of heterodyne DPSK. (Author abstract). 5 Refs.

Habbab, I.M.I. (AT&T Bell lab, Holmdel, NJ, USA); Kahn, J.M.; Greenstein, L.J. *Electron Lett* v 24 n 15 Jul 21 1988 p 974-976.

**073618 POLARISATION DIVERSITY RECEIVER USING A SIMPLE WEIGHT CONTROLLER FOR COHERENT FSK COMMUNICATIONS.** A polarisation diversity receiver using a simple baseband weight controller is demonstrated. A measured receiver sensitivity degradation of less than 0.3 db has been obtained in a 600 Mbit/s FSK lightwave system. It is also shown that the performance of this receiver is hardly affected by the nonideality of the controller characteristics. (Author abstract). 6 Refs.

Imai (NTT Lab, Yokosuka-shi, Jpn). *Electron Lett* v 24 n 15 Jul 21 1988 p 979-980.

**073619 DIRECT TIMING EXTRACTION IN A MODIFIED-MANCHESTER CODED PICOSECOND OPTICAL PULSE FIBRE OPTIC TRANSMISSION SYSTEM.** Direct timing extraction in a modified-Manchester-coded fiber optic transmission system is demonstrated. The presence of the clock signal in the received data is used to injection lock an electronic oscillator thus generating a large timing signal. The technique is also suitable for optical injection locking for timing extraction. (Author abstract). 8 Refs.

## Reviews

**073621 OPTICAL COMMUNICATION: THE DOORWAY TO THE INFORMATION ERA.** After some preliminary historical remarks about the origin and the itinerancy of the IOOC, some technical issues concerning the outstanding progress of optical communications are reported. This progress will soon involve not only the transmission links, but also other fields such as optical amplification, switching, data processing. So the optical communications are changing the present telecommunication network in a -Integrated Broadband Communication- (IBC) system, as it is called in Europe. In fact, the close cooperation among telecoms, broadcasters and computers is likely to give rise to the -Information Society- in which all kinds of sources, networks, user terminals and service will be encompassed. The various implications this transformation will have in human life are also illustrated. (Author abstract)

Catania, B. (CSELT, Turin, Italy). *CSELT Tech Rep* v 13 n 5 Oct 1985, IOOC-ECOC '85 (5th Int Conf on Integr Opt and Opt Fibre Commun - 11th Eur Conf on Opt Commun), Venice, Italy, Oct 1-4 1985 p 267-274.

## Sensors

**073622 INTEGRATED COMMUNICATION AND SENSING SYSTEM USING ONE SINGLE-MODE OPTICAL FIBRE.** A novel technique to integrate communication and sensing in one single-mode optical fibre by wavelength division multiplexing is described. Its principle

of sensing is based on the modulation of the interference pattern projected from the output end of a multimode optical fibre when the fibre is subjected to an external disturbance which changes its optical properties. It is demonstrated that the communication performance will not be degraded by the simultaneous sensing operation. (Edited author abstract). 6 Refs.

**073624 SATURATION ABSORPTION AND KERR SUSCEPTIBILITY IN POLYDIACETYLENE LANGMUIR-BLODGETT FILM.** Direct measurements of the saturation from Langmuir-Blodgett films of a polydiacetylene have been carried out in picosecond time domain. Using a photoacoustic technique, we have obtained directly the imaginary part of Kerr susceptibility. Its magnitude is found to be in excess of  $10^{-8}$  esu and the associated ground state recovery time is less than the laser pulse width of 3 ps. These results are discussed in terms of a phase space filling model for a one dimensional exciton. (Author abstract) 13 refs.

**073625 POLARISATION-INSENSITIVE COHERENT LIGHTWAVE SYSTEM USING WIDE-DEVIATION FSK AND DATA-INDUCED POLARISATION SWITCHING.** We present a technique where polarization-insensitive heterodyne detection is achieved through data-induced polarization switching. The polarization switching is brought about by inserting a passive, birefringent optical device in the path of the transmitted FSK signal. The experimental results show that this technique suffers a power penalty of 3-4 db when compared with a conventional FSK system with perfectly matched polarizations. This compares well with the expected penalty of 3 db. This approach uses a single optical receiver and no additional receiver electronics, which could be a significant advantage for local area networks. (Author abstract) 8 refs.

Cimini, L.J. (AT&T, Holmdel, NJ, USA); Habbab, I.M.I.; Yang, S.; Rustako, A.J.; Liou, K.Y.; Burrus, C.A. *Electron Lett* v 24 n 6 Mar 17 1988 p 358-360.

**073626 PHOTONIC SPACE-DIVISION SWITCHING SYSTEM UTILISING COHERENT OPTICAL TRANSMISSION TECHNOLOGIES.** Integration of photonic switching and coherent transmission was studied

ied. A photonic space-division (SD) switching system with a line capacity exceeding 500 is expected, taking advantage of the receiver sensitivity improvement and crosstalk rejection capability of coherent optical detection. SD switching experiments in a 100 Mbit/s optical FSK transmission system were carried out with a  $\text{LiNbO}_3$  photonic switch matrix. The crosstalk component was shown to be rejected by introducing channel separation greater than 3 GHz. (Author abstract). 6 Refs.

**073627 CROSSOVER MINIMIZATION IN DIRECTIONAL-COUPLER-BASED PHOTONIC SWITCHING SYSTEMS.** Methods to design directional-coupler-based switching networks with minimum number of crossovers are presented. Also presented is a modular construction scheme that allows large switching networks (with minimum of crossovers) to be built using identical chips containing smaller networks of the same type. The total number of crossovers and the maximum number of crossovers between an inlet-outlet pair have been analyzed in three major self-routing networks. Since many networks are based on these topologies, the results can be applied extensively to the study of many other switching networks. 26 refs.

**073631 ERROR MECHANISMS IN A FOUR-LEVEL PULSE WIDTH MODULATED OPTICAL FIBRE SYSTEM.** The error mechanisms in a four-level PWM optical fiber communication system are investigated. The error mechanisms are related to the noise variance and amplitude of the received signal at the sampling instants. This theory, referred to as the 'amplitude theory', is shown to be more generally applicable than an earlier theory, referred to as the 'slope theory'. The slope theory is an extension of the noise analysis for an analog PWM system. Theoretical and experimental results show that the slope theory generally underestimates the BER and that the amplitude theory gives a more accurate evaluation. (Author abstract) 7 refs.

**073632 PROPERTIES OF QUANTUM COMMUNICATION WITH RECEIVED QUANTUM STATE CONTROL.** The advantage of nonstandard quantum states such as two-photon coherent state (or squeezed states) and photon number state as transmitter state is strongly degraded by transmission loss in quantum communications. To cope with such a problem, a new application of these states is proposed, and it is shown that its system has infinite capacity. (Author abstract). 18 Refs.

**073633 SOLITON PROPAGATION IN OPTICAL FIBERS WITH RANDOM PERTURBATIONS.** Effects of randomly varying parameters of optical fibers on soliton propagation are studied numerically by using the propagating beam method. The results show that  $N=3$  and higher order solitons are strongly influenced by the random perturbations in dispersion and nonlinearity of the fibers. The lowest two order solitons, however, can stably transmit in such fibers and should be used for communication applications. (Author abstract). 6 Refs.

**073635 OPTICAL COMMUNICATION SYSTEM FOR SUPERVISORY CONTROL AND DATA ACQUISITION (SCADA).** Sumitomo received an order to build a supervisory control and data acquisition (SCADA) system using a fiber optic communication system and has successfully completed the system. This system is for a 230 kv power transmission network. The function of this system is: (1) automatic computer control of the pumping plant for a 9 km long 230 kv submarine OF cable and its monitoring; (2) signal transmission for control and monitoring of two switch yards and two substations; (3) protection signal transmission; and (4) communication network among four stations. The principal elements of this system can be divided into communication equipment such as PCM and MUX, the terminal equipment used in the SCADA system, the computer which controls the pumping plant, and the communication paths composed of OPGW, etc. To ensure high reliability, an integrated dual system, composed of a fiber

optic communication system linked by an optical submarine cable combining an OPGW and a wireless UHF communication system, is used. (Edited author abstract)

**073636 DESIGN AND CHARACTERISTICS OF AN OPTICAL FIBER CABLE FOR EMERGENCY USE.** Communication lines damaged during a disaster must be restored quickly since this seriously affects society. This paper examines the applications of optical cables to restore communication lines quickly in a large-scale disaster area where mechanical tools cannot be used. The paper also offers the conditions required for the structure design of the cable. Based on these examinations, an optical cable for emergency use was developed which contains four optical fibers, and weighs about 25 kg (including its reel), and can be carried by one man. The unit piece of the cable is 1 km; the numbers of pieces can be connected as required. Disaster cases where damaged cable sections are scattered on interoffice lines were examined, and the number of the sections which can be restored was estimated. (Author abstract) 12 refs.

**073638 THREE-CHANNEL WAVELENGTH-DIVISION-MULTIPLEXING TRANSCIVER MODULE USING LEDS FOR MULTIMODE FIBER TRANSMISSION SYSTEMS.** This paper describes the design and performance of a 3-channel wavelength-division-multiplexing (WDM) transceiver module for a broadband distribution system in the subscriber loops. The module incorporates WDM optical emitters, detectors and filters for compactness and ease of handling. Moreover, the emitter, the detector and input/output fibers are packaged

each with a collimating or focusing lens in order to enable mounting on the module substrate without adjustment. (Edited author abstract) 11 refs.

**073639 HIGH PERFORMANCE PUSH-PULL COUPLING SINGLE FIBER CONNECTORS AND PLUG-IN FIBER-OPTIC CONNECTORS.** This paper presents the development of compact, high performance and low cost single fiber connectors. They feature push-pull coupling connectors with rectangular connector housings and plug-in circuit-pack connectors with four plugs and four jacks mounted on the back panel and circuit board to realize high-density packaging of optical transmission equipment for subscriber loop systems. Actual field installed connectors with 50/125 GI fibers produced a satisfactory insertion loss of 0.06-0.10 db and a return loss of 26.9-27.8 db. (Author abstract) 7 refs.

**073640 THEORY FOR HETERODYNE OPTICAL ASK RECEIVERS USING SQUARE-LAW DETECTION AND POSTDETECTION FILTERING.** We present an approximate but comprehensive theoretical model for heterodyne ASK receivers relevant to optical communication systems where the transmitter and local oscillator have significant linewidths. The ASK receiver modeled here uses square-law detection and post-detection filtering. As a consequence of this detection scheme a key issue in the theory is to account for the very different noise statistics associated with receiving ONE and ZERO symbols. The theory also takes into account receiver noise and nonideal intermediate frequency (IF) filter characteristics and permits an evaluation of optimum threshold setting. Detailed numerical results for receiver sensitivity for a typical 140 Mbit/s pin-FET front end are presented. (Edited author abstract) 15 refs.

**073641 LES LIAISONS OPTIQUES SUR LES LIGNES AERIENNES.** [Optical Links on Overhead Lines]. New developments in optical fiber communication technology will soon allow E.D.F. to establish high quality telecommunication links on high voltage overhead lines. Being intrinsically immune to electromagnetic interference, optical fibers also bring a very high data rate capability. Special optical cables have recently been successfully field tested on a power line. These cables will support communications used for real time supervision and operation of the E.D.F. generation and transmission system. (Author abstract) In French.

**073642 HIGH BIT RATE FIBRE-OPTIC TRANSMISSION USING BIPOLAR PULSING AND DUO-BINARY SIGNALLING.** Schemes for high bit rate transmission of fibre-optic signal using LEDs with bipolar pulsing and duo-binary signalling have been discussed. The reverse pulsing together with preshaping of driving pulses has been found to increase the LED modulation bandwidth by a factor of four while with duo-binary signalling the bit-rate can be increased by a factor of two with 4-5 dB power penalty. A combination of the two techniques can thus lead to significant improvement in the bit-rate of transmission. (Author abstract) 8 refs.

**073643 DESIGN AND PERFORMANCE OF THE TAT-8 OPTICAL RECEIVER.** The development of low loss optical fiber and reliable opto-electronic devices has

led in recent years to the installation of a new generation of undersea communication links - optical fiber systems. Compared with their metallic counterparts, optical systems afford significantly greater transmission capacities and repeater spacings, the combined effect of which drives down the effective installation and running costs. This paper describes the design and performance of an optical receiver which has been developed and manufactured at the British Telecom Research Laboratories (BTRL) for the latest in this new generation of undersea systems - the TAT-8 digital transatlantic cable link. (Author abstract) 13 refs.

**073644 POLARIZATION DIVERSITY RECEIVERS USING ERROR-CONTROL CODES FOR HETERODYNE DETECTION LIGHTWAVE TRANSMISSION SYSTEMS.** In a coherent optical fiber communication with a single-mode fiber and an optical heterodyne detection for improved receiver sensitivity, degradations of the receiving sensitivity due to fluctuation of the polarization condition of the received light are a problem. As a possible solution to this problem, this paper proposes a polarization diversity system with an error-detecting code or an error-correcting code. Its characteristics are analyzed and optimum design values are obtained. (Edited author abstract) 9 refs.

**073648 100Mb/sec CMI OPTICAL TRANSMITTER/RECEIVER.** This paper describes an optical transmitter/receiver at a transmission rate of 100 Mb/sec. It employs the CMI coded mark inversion format with a constant mark ratio ( $= 1/2$ ), allowing stable clock extraction and data regeneration. The format is applicable to

optical loop LAN systems in which the input data mark ratio changes transitionally. Two ICs, a wide-band amplifier IC and a CMI CODEC IC have been newly developed. The minimum received optical power is  $-27.5$  dBm and the optical dynamic range is 25 dB by the use of a BTRS (buried twin-ridge substrate) laser in the  $0.8 \mu\text{m}$  wavelength region and a Si-pin photodiode. This implies that transmission through more than 3 km optical fiber of the GI (graded index) type with 500MHz-km bandwidth is possible. (Author abstract) 5 refs. In Japanese.

**073649 100Mb/sec OPTICAL LOOP NETWORK.** A 100Mb/sec optical loop network system based on the high-speed optical transmission technology has been developed. The loop network consists of node equipments which are connected to one another with double optical fibers in a loop configuration. On the optical highway, circuit switched data and packet switched data are multiplexed by the TDMA (time division multiple access) method. Every time-slot is dynamically assigned to circuit switched data or packet switched data depending on the traffic conditions so that the highway is efficiently used. Each of the node equipment has 80kb/sec, 1.5Mb/sec and 32Mb/sec subscriber line interfaces for circuit switching. The loop network also operates as a bridge among the packet switching bus networks. The loop network provides a general-purpose data highway which can integrate various media, such as voice, text, image and video media. (Author abstract) 4 refs. In Japanese.

**073650 KOPPLUNG VON LASERDIODE UND POLARISATIONSERHALTENDER GLASFASER DURCH KLEBEN.** [Coupling of Laserdiode and Polarization-Maintaining Fiber by Gluing]. In a wideband communications system with optical switching a space division switching unit based on lithium-niobate matrices is used. Such matrices need light of a defined state of polarization that will be provided via polarization maintaining fibers. These fibers are directly glued to the laser crystal so that the linearly polarized light of the laser matches one of their principal axes as exactly as possible. The influence of an angular mismatch on this coupling is calculated and a criterion for adjustment is determined. This gluing will alter the power balance of the laser and its P-I-characteristic, which is calculated in an appendix. With these formulas the laser-fiber coupling loss will be determined. (Author abstract) In German. 2 refs.

**073651 DETECTOR FOR SUBNANOSECOND OPTICAL PULSES.** A detector for subnanosecond optical pulses which uses GaAs power field-effect transistors and an avalanche photodiode is described. This detector makes it possible to obtain a voltage pulse with an amplitude of 1.5 V across an active load of  $50 \Omega$  at a pulse length of about 250 ps at the half-maximum level. There is provision for adjustment of the initial sensitivity of the photodiode. The height of the output pulses can be controlled electronically. (Author abstract) 6 refs.

**073652 POSSIBILITY OF DEVELOPING COMMUTATOR SWITCHES FOR OPTICAL COMMUNICATION CHANNELS FROM BULK ACOUSTO-TOPTIC DEFLECTORS.** The physical limitations which arise in the use of acoustooptic deflectors to switch optical communication channels, including optical-fiber

channels, have been studied experimentally. The number of channels which can be switched by a single device is shown to be limited by the magnitude of the crosstalk between channels. When single-coordinate deflectors are used, the number of channels can be more than 10; when two-coordinate deflectors are used, the number of channels can be more than 100. The typical expenditure of control energy per connection is approx. 1.5 W at a switching time approx. 1.5  $\mu$ sec. and at a radiative loss less than 10 db. (Author abstract) 4 refs.

**073653 OPTICAL RECEIVER EMPLOYING 850 nm FEEDBACK.** Optical feedback (OFB) transimpedance receivers have recently been shown to offer considerably better sensitivity than resistive feedback designs at low (1-2 Mbit/s) bit rates. We demonstrate an OFB receiver with a high sensitivity of  $-64.0$  dBm at 2.048 Mbit/s without the need for high-quality optoelectronic and electronic components. (Author abstract). 6 Refs.

**073654 FIBRE-OPTIC GRATING COUPLER FOR USE AS COMBINED POWER DIVIDER AND WAVELENGTH DEMULTIPLEXER.** A new design method is presented for step-structured phase-only gratings, which integrate two system functions (power divider and wavelength demultiplexer) in one single grating structure. Calculations based on simple Fourier transform techniques yield diffraction efficiencies between 75% and 83% for these structures. Because the depth is too large ( $> 10 \mu\text{m}$ ) for Fourier transform to be perfectly valid, these results cannot be considered to be reliable enough. Therefore the approximate results are verified by exact calculations based on Maxwell's equations, also considering polarization effects. By generalizing the algorithm, calculations can be carried out for almost any deep, stepped transmission and reflection grating. (Author abstract). 11 Refs.

**073655 SIMULATION STUDIES ON NONLINEAR BIT SYNCHRONIZERS IN APD-BASED OPTICAL RECEIVERS.** The problem of self-bit-synchronization utilizing nonlinear timing extraction schemes is examined in optical receivers with avalanche photodetectors (APD) through digital computer simulation. A direct algorithm is developed for the simulation of sample functions of the APD output process with due consideration to intersymbol interference. Simulation of all the functional blocks used for synchronization is carried out in the discrete time domain. Detailed performance results are given for a linear and four types of nonlinear timing recovery schemes for exponential and trapezoidal pulse shapes. Performances of the nonlinear timing recovery schemes are evaluated in terms of the rms timing jitter for nonreturn-to-zero as well as return-to-zero signaling formats. 16 refs.

**073656 COMPARATIVE STUDY OF EASILY INTEGRABLE PHOTODETECTORS.** Three different 800-nm photodetectors were fabricated using an ion-implanted GaAs MESFET technology. No modifications to the MESFET process were necessary, making these detectors among the most easily integrable reported. The three detectors are a photoconductor with an ion-implanted active region and a high photocurrent gain, a fast photodiode (FWHM (full width half maximum)  $< 53$  ps), and a zero-bias photodiode. Accurate comparisons of reported detectors are sometimes difficult because results are influenced by differences in the processing, material, device dimensions, active area, and testing.

These factors are identical for the three detectors reported, making possible a fair comparison among detector types. 18 refs.

**073657 PLANAR EMBEDDED INP/GAINAS P-I-N PHOTODIODE FOR VERY HIGH-SPEED OPERATION.** Planar embedded InP/GaInAs p-i-n photodiodes have been fabricated by using preferential ion-beam etching for planarizing and embedding the p-i-n photodiode structure in a semi-insulating InP substrate. The stray capacitances caused by a bonding pad and an interconnection have been markedly reduced, which resulted in extremely low capacitance of less than 0.08 pF for a diameter of 20  $\mu\text{m}$  of photosensitive area. It has been demonstrated by an optical heterodyne technique that the photodiode exhibits a maximum cutoff frequency of 14 GHz. This result was analyzed taking the depletion layer thickness into account and has been found to be dominated by the carrier transit time. The demonstrated low capacitance and high-speed response result indicates the suitability of the p-i-n photodiodes not only for a discrete p-i-n photodiode but also for optoelectronic integration. 17 refs.

**073659 TWO AND THREE LEVEL OPTICAL PCM TRANSMITTER DESIGN FOR MULTIGIGABIT SYSTEMS USING A RELAXATION OSCILLATION TECHNIQUE.** A theoretical method based on gain switching of semiconductor lasers is described which optimizes the bandwidth and modulated output power from a given laser for application in optical PCM (pulse-code-modulation) systems. Both two-level and three-level systems are considered. The type of laser used to demonstrate the technique is typical of an AlGaAs buried heterostructure laser. A three-level optical system based on only two electrical drive levels is evaluated. Numerical results based on the single-mode rate equations, including a diffusion term, predict bit rates of 5 Gb/s for a two-level system and 8 Gb/s for the three level system. The technique was also applied to short cavity and quaternary lasers. 18 refs.

**073660 GIGABIT-PER-SECOND DUAL-GATE MESFET SWITCHING AND MULTIPLEXER OPERATION FOR HIGH-SPEED FIBER-OPTIC SYSTEMS.** The operation of dual-gate GaAs MESFETs in Gb/s switching applications for high-speed fiber-optic systems is investigated, and a full nonlinear modeling procedure is presented for general switching simulations. The model is characterized by an efficient technique that only requires two-port s-parameter measurements to determine the nonlinear element variations. Circuit simulations implemented on SPICE 2 have been applied to evaluate the transient switching response of dual-gate MESFETs in several circuits involving 1-Gb/s pulse conversion and synchronization, pulsewidth reduction, and 2-Gb/s multiplexing. The results show good agreement between predicted and experimental switching waveforms. 18 refs.

**073664 GIGABIT SINGLE-MODE FIBER TRANSMISSION USING 1.3- $\mu\text{m}$  EDGE-EMITTING LEDS FOR BROAD-BAND SUBSCRIBER LOOPS.** Gigabit single-mode fiber transmission using 1.3- $\mu\text{m}$  edge-emitting LEDs for broadband subscriber loops is described, focusing on a method of calculation for maximum transmission distance and 1.2-Gb/s and 600-Mb/s transmission experiments. The maximum transmission distance is estimated by taking into account the wavelength dependence for both chromatic dispersion and loss of the single-mode fiber. The possibility of gigabit transmission near the dispersion-free wavelength 1.3  $\mu\text{m}$  is confirmed. The 1.3- $\mu\text{m}$  edge-emitting LED and a driver circuit with a simple response compensation circuit has been developed for this application.

**073665 ROBUST MATCHED FILTERS FOR OPTICAL RECEIVERS.** The design of optical receivers that are robust against uncertainty in the statistics of the observation process in photodetection is investigated. A modification in the design of the postdetection matched filter is proposed to account for possible uncertainty in the rate function of the incident light, the rate of the dark current, and in the statistics of the additive noise present at the input to the optical receiver. The design is based on a game-theoretic approach in which a filter is sought that has the maximum worst-case output signal-to-noise ratio possible over the class of allowable statistics; that is, the design criterion is maximin signal-to-noise ratio. A general characterization of maximin robust matched filters for observed Poisson processes is presented, and solutions for

several useful uncertainty models are obtained. Numerical results for a specific example illustrate the performance of the technique. 23 refs.

Geraniotis, Evangelos A. (Univ of Maryland, College Park, MD, USA); Poor, H. Vincent. *IEEE Trans Commun* v COM-35 n 12 p 1289-1296.

**073666 JITTER TOLERANCE OF FIBER OPTIC REGENERATORS.** The effect of accumulated jitter on the decision-making process inside the Nth fiber-optic regenerator of a long chain of fiber optic regenerators is analyzed. The criteria for a correct bit decision in the presence of receiver noise, static phase offset, and accumulated input jitter are derived, and the bit-error-rate penalties caused by the presence of known distributions of accumulated input jitter are calculated. It is shown that excessive bit-error-rate penalties will not occur if the accumulated input jitter does not exceed the regenerator's measured jitter tolerance template. The jitter tolerance measurement technique is used to find the optimum sampling time inside a fiber-optic regenerator, resulting in a regenerator that is optimized for use in long-haul systems. 22 refs.

**073667 COMPUTING THE PERFORMANCE OF OPTICAL RECEIVERS WITH AVALANCHE DIODE DETECTORS.** A method is described for exactly computing the probability distribution of the sum of the output of an avalanche diode and Gaussian noise using the Personick-McIntyre model of the random electron multiplication in the diode. A saddlepoint approximation is also presented. Both are incorporated in an optimization procedure for efficiently calculating the minimum input signal strength and the decision level that are needed to attain a preassigned error probability when the diode is embodied in a binary optical communication receiver. 13 refs.

**073668 THICK-FILM CRYSTAL GROWTH OF HIGHLY B<sub>1</sub>%-SUBSTITUTED GARNET FOR OPTICAL ISOLATORS.** The melt composition needed to obtain pit-free, highly Bi-substituted (BiLu)<sub>3</sub>Fe<sub>5</sub>O<sub>12</sub> crystals by the LPE method was investigated. It was confirmed that adding B<sub>2</sub>O<sub>3</sub> to the melt increases the equilibrium segregation coefficient of Bi,  $K_{O(Bi)}$ . It was found that a decrease in garnet composition ratio  $R_4$  acts to increase the growth-rate dependence of the normalized effective segregation coefficient of Bi  $K_{eff(Bi)}/K_{O(Bi)}$ . Crystals with mirror-smooth surfaces were obtained by adding Gd<sub>2</sub>O<sub>3</sub> to the melt. Using a melt with Gd<sub>2</sub>O<sub>3</sub>/Lu<sub>2</sub>O<sub>3</sub> ≥ 1, the pits that usually appear in LPE growth of (BiLu)<sub>3</sub>Fe<sub>5</sub>O<sub>12</sub> were eliminated and pit-free, highly Bi-substituted (BiLuGd)<sub>3</sub>Fe<sub>5</sub>O<sub>12</sub> crystals were obtained. The optical properties of 250-μm-thick (BiLuGd)<sub>3</sub>Fe<sub>5</sub>O<sub>12</sub> crystals were measured in order to evaluate their applicability to optical isolators for use at 1.3 μm. A sufficient Faraday rotation of  $\theta_F = -1800$  deg/cm and an extinction ratio of -40 dB were obtained. 4 refs.

**073669 OPTICAL AND OPTOELECTRONIC DEVICES FOR OPTICAL FIBER TRANSMISSION SYSTEMS.** The present status and research trends in light sources, detectors, and various optical components are described, focusing mainly on those for single-mode fiber systems. Laser-diode and light-emitting-diode sources are described, and their problems and advantages are examined. The features of optical detectors, namely, avalanche and p-i-n photodiodes are discussed. A method of comparing the performance of optical receivers with different detectors, by examining the minimum detectable

power at a specified error probability for the received pulses, is presented. Optical components such as optical filters, couplers, dividers; isolators, connectors, and switches are considered briefly. The potential of optoelectronic integrated circuits is discussed. 16 refs.

**073670 VERY SMALL SINGLE-MODE TEN-FIBER CONNECTOR.** A small plastic molded single-mode ten-fiber connector has been developed for high-count optical subscriber cables. The connector ferrule alignment mechanism is designed with a sufficient factor of safety to allow rough handling during connection. The ferrules are precisely aligned by alignment pins and guide sleeve. The fabricated connector, which has a cross section of just 4 mm × 6 mm, exhibited an average loss of 0.4 dB and reconnection time of less than 0.5 min. Connection loss does not change after over 1000 reconnections. 9 refs.

**073671 DISPERSION PENALTY FOR 1.3-μm LIGHTWAVE SYSTEMS WITH MULTIMODE SEMICONDUCTOR LASERS.** The effect of fiber dispersion on the performance of lightwave systems is analyzed for the case where multimode semiconductor lasers operating near the zero-dispersion wavelength of the single-mode fiber are used as sources. Both the intersymbol interference and the mode-partition noise are considered in the discussion of dispersion-induced power penalties. The theory is in agreement with an experiment in which the bit error rate is measured for lasers at various bit rates. The tolerable limits on the deviation of the laser wavelength from the zero-dispersion wavelength are obtained for a 1.3-μm system operating at 1.7 Gb/s. Monte Carlo simulations are used to predict the effect of mode-partition noise on the performance of such high-speed lightwave communication systems. 11 refs.

**073672 PERFORMANCE IMPLICATIONS OF MODE PARTITION FLUCTUATIONS IN NEARLY SINGLE LONGITUDINAL MODE LASERS.** A statistical model of mode partition fluctuations is developed for semiconductor laser diodes with a single dominant lasing mode and one vestigial side mode. It is the basis of a rigorous analysis of the influence of partition fluctuations on the performance of digital lightwave transmission systems. A Gauss quadrature rule is used to evaluate the average probability of error in the presence of mode-partition-dependent shot noise, photodetector multiplication noise, circuit noise, and intersymbol interference. This methodology permits the determination of reliable performance estimates enabling the establishment of permissible degrees of mode partition fluctuations. 32 refs.

Cartledge, John C. (Queen's Univ, Kingston, Ont, Can). *J Lightwave Technol* v 6 n 5 May 1988 p 626-635.

**073673 ANALYSIS OF SENSITIVITY DEGRADATION CAUSED BY THE FLICKER NOISE OF GaAs-MESFET'S IN FIBER-OPTIC RECEIVERS.** The total input noise current and sensitivity of the fiber-optic receiver was calculated. The flicker noise source was included by adopting a pertinent flicker noise model. Power penalties caused by the flicker noise were calculated for various fiber-optic receivers using the calculated noise current. It has been found that the flicker noise affects the sensitivity over the whole range of the bit rates, and that the total input capacitance is an important parameter affecting the power penalty which is serious in the case of a high-impedance-type p-i-n FET receiver. The optimum feedback resistance for practical p-i-n FET receiver design is also suggested. 27 refs.

search Inst, Chungnam, South Korea); Shim, Chang-Sup; Kang, Min-Ho. *J Lightwave Technol* v 6 n 5 May 1988 p 660-667.

**073674 TRANSMISSION QUALITY AND PERFORMANCE OF ILL REPEATERS USED IN OPTICAL FSK COMMUNICATIONS.** The use of injection-locked laser diodes as nonregenerative repeaters for optical frequency-shift keying (FSK) transmission systems is considered, with emphasis being placed on potential impairments which may limit performance. Nonlinear phase distortion associated with the amplification of FSK signals by injection-locked lasers (ILLs) is considered, as are the effects of intensity fluctuations on the locking bandwidth, the influence of laser phase noise, ILL frequency stability requirements, and the number of repeaters that can be cascaded before loss of lock occurs. How these factors combine to influence overall system performance is also examined. 20 refs.

O'Byrne, Vincent (Univ of Coll of North Wales, Bangor, North Wales); O'Reilly, John J. *J Lightwave Technol* v 6 n 5 May 1988 p 695-703.

**073675 OPTIMIZATION OF AN OPTICALLY PULSED PHOTOCELL ARRAY AS A SENSOR POWER SOURCE.** A method for improving the efficiency of the conversion of pulsed optical power to electrical power by photovoltaic cells is presented. A fiber-optic echo sensor being developed requires a pulsed power source with a storage capacitor to hold energy for a time after the optical power is turned off. By charging capacitors from each cell individually with a switching transistor control, a higher efficiency is obtained than when the common method of series charging is used. 8 refs.

Trisno, Yudhi S. (State Univ of New York at Buffalo, Amherst, NY, USA); Wobschall, Darold. *IEEE Trans Instrum Meas* v 37 n 1 Mar 1988 p 142-144.

**073676 OPTIMIZATION OF THE OPTICAL SENSITIVITY OF p-i-n FET RECEIVERS.** The optimization of the input stage of a p-i-n FET receiver is discussed, with emphasis on the implications for an integrated InP/InGaAs p-i-n FET technology. In the early stages of development of this technology, it is necessary to keep the design simple, which implies that the device will consist of a single-stage, low-gain amplifier. Design criteria for such an amplifier are presented, and it is shown that the transimpedance configuration provides better sensitivity than a voltage amplifier, even when the gain of the amplifier is very small. It is also shown that the gate capacitance (i.e., width) of the input FET which optimizes the sensitivity is much smaller when the amplifier gain is low than it is in the high-gain limit. 9 refs.

**073679 LIGHT-LINK OPTOCOUPERS ARE FASTER.** Optocouplers are versatile devices used in modern microelectronic applications. Siemens has developed new devices called light-link components for constructing optocouplers with features superior to those of standard coupling elements. The new light-link components are ideal for constructing coupling elements with features so far only provided by standard couplers. High isolation voltage and improved high-frequency characteristics are important features. Three circuits capable of handling 50 kHz, 200 kHz and 1 MHz are described in the article. The devices are also suitable for use in light-sensing applications. 2 refs.

**073680 OPTICAL TRANSMISSION SYSTEMS OF TWIN-21 BUILDING.** Construction of intelligent buildings equipped with optical communication systems has been promoted these years. For the purpose of practical application and verification of the optical transmission systems to be introduced in future high buildings, various optical transmission systems using optical communication techniques have been built in the Twin-21 Building in Osaka Business Park. The systems include the following: (1) Building control and monitoring system using a 1Mb/sec optical loop network; (2) ITV monitoring and control system in elevators for preventing fire and crimes; (3) OA systems using a 100Mb/sec optical LAN as the trunk line; (4) Visual information system for AV information service in the buildings; and (5) TV periscope system applying a camera control system. The paper describes the setup of these systems and the details of the visual information system. (Author abstract) 4 refs. In Japanese.

Components

**073681 OPTICAL CABLES, SWITCHES AND LOGIC (OR MADNESS).** Optical fibres are well established as the preferred long and medium distance communications medium. Optical interconnect technology, deeply embedded down to wafer level in otherwise electronic processors, seems likely to allow electronics to push to higher speed-complexity product values. In networks, it is extremely attractive to look forward to 'all optical networks' as an elegant concept. Will it be a hybrid assembly, an all III-V opto-electronic system or a new combination such as III-V grown on silicon, using silicon as the prime electronic medium? These issues have yet to be resolved, but represent a fascinating challenge for those interested in pushing still further the scope for opto-electronics within communications.

Design

**073684 WAVELENGTH-DIVISION-MULTIPLEXING TRANSCIEVER MODULE.** This paper describes the design and performance of a 3-channel wavelength-division-multiplexing (WDM) transceiver module for a broadband distribution system in subscriber loops. The module incorporates WDM optical components such as emitters, detectors and filters for compactness and ease of handling. Moreover, the emitter, the detector and the input/output fiber are packaged each with a collimating or focusing lens in order to enable mounting without adjustment on the substrate of the module. Good performance and high stability were confirmed for the module through tests. (Author abstract) 9 refs. In Japanese.

**073686 OPTICAL-ACTUATOR-MULTIPLEXED, SERIAL TRANSMISSION FIBER ENCODER.** An optically-driven, electro-mechanical actuator is described, which can sequentially connect a single multimode input fiber to each fiber of a 12-fiber array. The optical drive is effected remotely over a long fiber cable, and only 16  $\mu$ W received optical power is required for resonant scanning of the array. The output array fibers are configured to read

ten tracks of a reflective absolute encoder disc, and to transmit the digital word to a readout station. The inherent serial, digital code format conveys the readout with a high level of transmission-path independence. (Author abstract) 6 refs.

Electric Properties

**073687 CURRENT CROWDING EFFECTS IN GAAS/ALGAAS HETEROJUNCTION PHOTOTRANSISTORS.** The heterojunction phototransistor (HPT) has applications as an optical detector/amplifier in receivers for fiber optic communications systems. It is well known that the provision of an external bias, either optically or electrically, via a third (base) terminal, can enhance the performance of the HPT in terms of gain, a speed of response and signal to noise ratio. This is due principally to an increase in emitter efficiency and a reduction in the RC time constant of the emitter base junction. In the paper we show that crowding of the bias current and the signal current can affect very significantly the high frequency performance of phototransistors and will limit the advantage given by the external bias in three-terminal devices but improve the performance of two-terminal devices. The implications for the design of high speed phototransistors are discussed. (Author abstract) 12 refs.

Electronics Packaging

**073688 GIGABIT RECEIVER IC'S FOR OPTICAL COMMUNICATIONS.** The authors discuss gigabit receiver ICs for optical communications, focusing on their circuit and package design, the performance of receivers that were fabricated, and their application to a 1.6 Gb/s optical receiver. The key technologies for the receivers are discussed, and a design based on these key technologies is proposed. The proposed design is used to fabricate six receiver ICs (eight chips) using an ultra-high-speed bipolar process with transistors having a unity gain bandwidth of 6-8 GHz. The receivers are suitable for long-haul optical transmission at bit rates up to 1.6 Gb/s. Experimental results show that the 1.6-Gb/s receiver has an optical dynamic range of more than 23 dB without any adjustment, and the received average optical power required to maintain a  $10^{-11}$  error rate is less than -dBm. 6 refs.

Laser Applications

**073690 IMPACT OF LASER INTENSITY NOISE ON ASK TWO-PORT OPTICAL HOMODYNE RECEIVERS.** The letter describes experimental results obtained with a multipoint optical homodyne receiver employing a DFB laser. The receiver performance is found to be limited by the intensity noise of the local oscillator

rather than by the phase noise, even when the product of the IF linewidth and the bit duration is as large as 0.56. A relative intensity noise level of at least  $-140$  dB/Hz will be required for a satisfactory receiver performance with  $-15$  dbm local oscillator power. (Author abstract) 6 refs.

## Mathematical Models

**073695 ASK HOMODYNE SYSTEM RECEIVER USING A 6-PORT FIBER COUPLER.** The transmission performance of an ASK optical homodyne system is investigated, which uses a 6-port optical fiber coupler at the receiver. The effect of phase imbalance in the fiber coupler outputs is considered and shown not to be a significant factor, provided the path delays in the receiver are equalised. In this case, the system has a similar receiver sensitivity and allowable laser linewidth as that for conventional ASK heterodyne systems using nonsynchronous demodulation techniques. (Author abstract) 7 refs.

**073705 OPTICAL AMPLIFIER CONFIGURATIONS WITH LOW POLARIZATION SENSITIVITY.** The sensitivity of optical amplifiers to signal polarization is avoided with use of configurations in which two amplifiers are combined. We describe experiments with a series and a parallel arrangement of two optical amplifiers. The experiments demonstrate a polarization-insensitive amplification for both configurations over a spectral range of at least 80 GHz. (Author abstract) 5 refs.

**073707 DEVELOPMENT OF MULTICORE OPGW WITH TAPE-COATED FIBERS.** To ensure stable and efficient supply of power, electric power companies are now promoting the use of composite fiber-optic overhead ground wire (OPGW) as a highly reliable medium for the transmission of a variety of data in large volume. As the volume of data to be transmitted continues to grow larger and larger, the need has arisen for multi-core OPGW capable of holding even more optical fiber. The authors have developed a multi-core OPGW with a new fiber unit construction which doubles the number of fiber cores without making any changes in the basic construction of conventional OPGW. This has been accomplished by replacing the fluorocarbon polymer sheath, which was previously used for the secondary sheath of the optical fibers, with an overlapping wrapping of thin heat-resistant tape. This new construction not only makes it possible to achieve optical multi-core fiber cable with an extremely small diameter, but it also improves the heat resistance and other thermal characteristics. (Edited author abstract) 7 refs.

**073708 IMPACT OF REFLECTIONS ON PHASE-DIVERSITY OPTICAL HOMODYNE RECEIVERS.** Reflections as small as  $-35$  db in the local oscillator path can cause deterioration in the performance of two-branch phase-diversity optical homodyne receivers, even when optical isolators protect the laser. The impact of reflections can be alleviated through the use of balanced receivers. (Author abstract) 6 refs.

**073709 FIBEROPTIC TRANSMITTERS AND RECEIVERS TACKLE LOCAL LINKS.** A growing array of lower cost, off-the-shelf transmitter and receiver modules is accelerating the move to fiber optics. Covering a broad range of data rates, these transmitter and receiver modules provide increasingly extended transmission capability with a minimum of electromagnetic and radio-frequency interference. Many higher performance devices use a 1,300-nm wavelength light source capable of communicating over a few tens of kilometers without requiring a repeater. Bit error rates commonly run in excess of  $10^{-9}$ .

**073713 WIDE BANDWIDTH LOW NOISE PIN FET RECEIVER FOR HIGH-BIT-RATE OPTICAL PREAMPLIFIER APPLICATIONS.** A wide bandwidth low noise pinFET receiver has been fabricated and characterized for optical preamplifier applications. The receiver uses a low capacitance planar pin diode as the photodetector. A bandwidth of 7.08 GHz was measured. The measured input noise current for the receiver front-end is lower than  $12 \text{ pA}/\sqrt{\text{Hz}}$ . Using a  $1.3 \text{ } \mu\text{m}$  DFB laser as the transmitter, at a data rate of 4 Gbit/s, the measured receiver sensitivity is  $-25.5 \text{ dbm}$  with a bit-error-rate of  $1 \times 10^{-9}$ . A set of two such receivers has been tested in a  $1.3 \text{ } \mu\text{m}$  polarization-insensitive optical preamplifier system experiment. The measured receiver sensitivity, including an optical insertion loss of 1.5 db, is  $-29.3 \text{ dbm}$ . (Edited author abstract). 3 Refs.

## Reliability

**073714 RELIABILITY OF LEDs AND QUATERNARY PHOTODIODES.** This paper outlines the investigation into the reliability of GaAlAs and InGaAsP LEDs, and InGaAsP photodiodes, which have been used in the fiber-optic video distribution system. All devices are found to be sufficiently reliable. The study also showed that: (a) GaAlAs LEDs with an Al content as high as 0.78  $\mu\text{m}$  band-gap, have reliability comparable to the usual 0.8  $\mu\text{m}$  band-gap LEDs, (b) Homogeneous degradation of InGaAsP LEDs is caused by electrode migration, (c) InGaAsP photodiodes do not endure electrical-surge as well as Ge photodiodes, and (d) Discontinuous bias application improves device reliability. (author abstract) 10 refs.

**Switching** See Also OPTICAL DEVICES—Switching.

**073717 OPTICAL SWITCHING NETWORKS USING TREE-STRUCTURED WAVEGUIDE OPTICAL SWITCHES.** To make a large-sized optical matrix is an important subject in realizing optical switching systems. This paper offers optical switching networks using tree-structured  $N \times 1$  waveguide switches as fundamental elements. Approximated equations for the insertion loss and the multiple crosstalk are given and it is shown that those in the proposed networks are approximately proportional to the number of stages in the tree structure. A  $4 \times 4$  optical highway switch using  $\text{Ti:LiNbO}_3$  tree-structured directional couplers was tested to confirm its switching capability. (Edited author abstract) 20 refs.

**073718 32-LINE OPTICAL SPACE-DIVISION SWITCHING SYSTEM USING  $8 \times 8$  OPTICAL MATRIX SWITCHES.** This paper describes the world's first trial of a 32-line optical space-division switching system which can be used in future broadband private networks and also in broadband ISDN.  $\text{LiNbO}_3$   $8 \times 8$  optical matrix switches with 64 switch elements integrated on one chip have been developed for this system. An improved folded optical switching network, which has the advantage of low insertion loss, has been used. The influence of crosstalk in the optical switching network has also been discussed. Finally, the design of an experimental optical switching system, using the  $8 \times 8$  optical matrix switches, is explained. The system has been successfully operating in exchanging 800-Mbps optical signals. (Author abstract) 3 refs.

**073722 REAL TIME OPTICAL LOGIC PROCESSING.** A real time optical logic processor is described. The logic states (zero or one) are encoded by two gratings with different frequencies and the logic operations are performed by spatial filtering. The processor has two output channels. Experimental results are presented. (Author abstract) 8 refs.

Yang, Xiangyang (Tsinghua Univ, Beijing, China); Chin, Kuo-fan; Wu, Minxian. *Opt Commun* v 64 n 5 Dec 1 1987 p 412-416.

**073723 THRESHOLD PROCESSING OF OPTICAL SIGNALS IN ANGLE-CODE CONVERTERS WITH SCANNING.** The author proposes a structural implementation of threshold processing of optical signals in angle-code converters that enables elimination of the error owing to the finite dimensions of the light beam. A knife edge is used as a convenient base for aligning and operating the angle-code converter. It 'materializes' the direction of the beam, and its absolute position in space can be easily controlled by well-known measurement techniques. The proposal procedure was tested in an X-Y ADC of displacements for an encoder of graphical images with scanning of a laser beam. It is shown that the maximum absolute area of the angular measurements equalled 8 inches in the entire range of angles and was independent of the specific photodetector: the angle was reliably measured between the edges of the knives. 7 refs.

Bogatyrenko, K.I. *Meas Tech* v 29 n 9 Sep 1986 p 832-835.

**073724 DIGITAL OPTICAL MATRIX MULTIPLICATION BASED ON A SYSTOLIC OUTER-PRODUCT METHOD.** A hybrid optical architecture for digital matrix-matrix multiplication is discussed. The proposed system requires less hardware than outer-product optical matrix multipliers and offers a higher processing speed than systolic array matrix multipliers. The throughput and hardware requirements of the proposed architecture are discussed with reference to the availability of various electro-optic devices. The performance of the proposed system is compared to existing systolic array optical matrix multipliers and to outer-product-based optical matrix processors. The accuracy and error rate of the proposed architecture are evaluated. (Author abstract) 16 refs.

**073732 TIME DIFFERENTIATION OF IMAGES BY MEANS OF OPTICALLY CONTROLLABLE TRANSPARENCIES WITH A (METAL-INSULATOR-SEMICONDUCTOR)-(LIQUID CRYSTAL) STRUCTURE.** A time differentiation of images of transparencies with a (metal-insulator-semiconductor)-(liquid crystal) structure is described. Experimental results are reported on the use of this operation on optical and television images. A physical mechanism explaining the effect is examined. (Author abstract) 3 refs.

Dumarevskii, Yu.D.; Kovtonyuk, N.F.; Petrovicheva, G.A.; Savin, A.I. *Optoelectron Instrum Data Process* n 4 1987 p 62-66.

**073733 OPTICAL METHOD FOR CODING AND PROCESSING DATA.** The idea, suggested in previous papers, of using a multilayer interference filter as a processor for processing data in the solution of nonlinear equations is developed. First, arguments are presented for the case that an interference filter has advantages over other systems. A theorem describing the properties of this filter is formulated. Second, a new approach for using an interference filter is proposed. In this approach, the device works in monochromatic light. The effect is to simplify practical implementations. Third, a hybrid data processing system, which combines a digital computer with an optical processor, is proposed. (Author abstract) 2 refs.

Stolov, E.G. *Optoelectron Instrum Data Process* n 4 1987 p 91-93.

**073734 OPTICAL-ELECTRONIC SYSTEM FOR TECHNICAL VISION OF ROBOTS.** The use of a hybrid optical-electronic complex for data processing for pattern recognition is discussed. Such a system is shown to be useful in robotics as a system of technical vision. A high analysis rate is achieved thanks to a preliminary data processing in a coherent processor, which carries out the mathematically most laborious operations. Experimental results are reported. Algorithms for a digital processing of correlation-field images are described. (Author abstract) 4 refs.

**073736 OPTICAL PROCESSING OF RANGE IMAGERY FOR SEGMENTATION.** Using multi-sensor image information aids in the interpretation of a represented scene. By segmenting the scene into meaningful parts, we can analyze each individual component and create a description of the scene. Range data is useful for segmenting an image into objects based on the distance relationships between pixels. In this paper, we demonstrate a hybrid optical/digital technique for segmenting range data into object and non-object regions. The object

regions found are used as masks to be ANDed with other sensor imagery for identification of the regions. (Author abstract). 8 Refs.

**073740 USING COINCIDENT OPTICAL PULSES FOR PARALLEL MEMORY ADDRESSING.** A memory structure is proposed that provides for parallel access in a multiprocessor environment. The proposed system has two advantages. First, it distributes the address-decoding circuitry to each of the requesting units on a common bus, thus eliminating the bottleneck of centralized decoding of encoded memory addresses. Second, it allows for parallel fetches of memory data with a level of parallelism limited only by the ratios of optical to electronic bus bandwidths and the dimensionality of the memory array. Both 1-D and 2-D structures are considered. 12 refs.

## Analysis

**073742 OPTICAL LOGICAL OPERATION AND MOIRE PATTERN.** Based on optical logical operations, a new approach to extract a specific beat pattern from superposed periodic structures is proposed. Gratings are first periodically encoded and then processed by logical operation. Experimental results are presented. (Author abstract) 11 refs.

Zhang, Jiajun (Shanghai Inst of Optics & Fine Mechanics, Shanghai, China); Liu, Liren. *Opt Commun* v 66 n 4 May 1 1988 p 179-182.

## Calculations

**073743 PYRAMIDICAL PIPELINING OF AO CELLS FOR COMPUTING SUCCESSIVE MATRIX POWERS.** The paper describes an optical implementation for successive matrix powers, using an optical processor as a basic component for matrix/matrix multiplication with unidirectional data flow. Then, a series of optical processors are lined up to produce a pyramidical pipeline for successive matrix squarings. Suitable applications which would benefit include, besides the calculation of matrix powers, the evaluation of matrix polynomials, iterative solutions of linear equations, iterative matrix inversion, and the calculation of matrix functions, i.e. matrix exponential. (Author abstract) 13 refs.

## Design

**073744 FAST PARALLEL OPTICAL DIGITAL MULTIPLICATION.** A parallel optical binary multiplication scheme is proposed in which parallel convolution preprocessing is performed using a parallel-input optical outer-product processor together with a one dimensional either space or time integrator. Using a theta-modulation based optical A/D converter and a carry look-ahead adder array, the resulting mixed-binary partial product can be reduced to the final multiplication result. (Author abstract) 25 refs.

Li, Yao (City Coll of New York, New York, NY, USA); Eichmann, George; Alfano, R.R. *Opt Commun* v 64 n 2 Oct 15 1987 p 99-104.

**073745 REAL-TIME OPTICAL PARALLEL PROCESSOR FOR BINARY ADDITION WITH A CARRY.** A bichannel optical shadow casting (OSC) technique has been proposed for logic operation and addition of multi-bit binary numbers. In case of addition the 'carry' is accommodated by spatial placement of channels. Optoelectronic half and full adders, using spatial light modulators (SLM), optical to electrical converters, beam splitters and mirrors, form additional building blocks in the proposed processor, where operations are performed in parallel. Limitations are discussed. (Author abstract) 16 refs.

## Equipment

**073746 OPTICAL CONSIDERATIONS IN THE DESIGN OF DIGITAL OPTICAL COMPUTERS.** This paper spells out the computational requirements and limitations for non-linear optical devices and optical

interconnects. Relationships between the optical properties of devices (transmission and contrast) and their potential computational properties (fanin and fanout) are derived. The accuracy of the intensity levels required in the system are estimated. The requirements for a minimal device useful for digital optical computing are stated. The 'volume' of a device in phase-space limits fanin, switching energy and the degree of space variance in the interconnections. Space-invariant and space-variant interconnections are compared. Limits of random interconnects by volume holograms are discussed. (Edited author abstract) 37 refs.

Prise, M.E. (AT&T Bell Lab, Holmdel, NJ, USA); Streibl, N.; Downs, M.M. *Opt Quantum Electron* v 20 n 1 Jan 1988 p 49-77.

## Mathematical Models

**073747 OPTICAL COMPUTATION OF DETERMINANTS.** We have presented a new algorithm for the determinant computation, which is suitable for optical realization. N systems of simultaneous equations are solved in order to find a value of the determinant (N is a dimension of determinant). The algorithm is devised to be used in a hybrid opto-electronic setup, that essentially solves a system of simultaneous linear equations by an iterative procedure. (Author abstract) 15 refs.

**073749 BEHAVIOUR OF POLARIZATION BEAM SPLITTERS MADE FROM DIFFERENT TYPES OF FIBER.** In the paper, polarization beam splitters are studied. Our theoretical study reveals that the coupling length and modulation period of a polarization beam splitter made from the depressed cladding fiber are shorter compared with that made from the matched fiber. Thus the former is characterized by a short interaction length. On the other hand, a polarization beam splitter made from the raised cladding fiber has a longer coupling length and a longer modulation period than those made from the matched fiber. (Author abstract) 10 refs.

**073750 ABSOLUTE-TYPE OPTICAL FIBER ROTARY ENCODER FOR NATIONAL AEROSPACE LABORATORY SCIENCE AND TECHNOLOGY AGENCY.** The rotary encoder, which measures the angle of rotation, was planned as part of the research on the future technology of the STOL plane developed by National Aerospace Laboratory of the Science and Technology Agency. IHI manufactured the encoder as part of the component development of the FBL (Fly By Light) of the flight control system of the aircraft. The encoder detects the control surface angle and converts it into digital signals of absolute code. It increases the reliability of the flight control system and enables highly accurate control through adoption of the resistance against lighting interference, electromagnetic interference, and electrical insulation. This article presents the specifications of this device and describes its configuration and features.

**073751 OPTICAL ISOLATOR.** An optical isolator using the Faraday effect is used for preventing noise generation and transmission characteristic degradation caused by the light feedback to the laser diode (LD) from the refractive surface in an optical transmission path. A composite film of  $(\text{BiLuGd})_3\text{Fe}_2\text{O}_{12}/(\text{BiGd})_3(\text{FeGa})_5\text{O}_{12}$  has been developed by the 2-step LPE method as a Faraday rotator which has a temperature dependence derivative of Faraday rotation angle of  $\beta \leq 0.01$ . By the use of this film, an optical isolator and an LD module have been trially fabricated for evaluation. As a result, the degradation of the isolation ratio ( $-34$  db) of the isolator is less than 1 db in the temperature range of 20 to 60°C. No periodic noise occurs in this temperature range even when a feedback light is applied from the fiber farthest end. Thus, a stable optical isolation effect is obtained against temperature change. (Author abstract) In Japanese. 13 refs.

**073752 OPTICAL STAR COUPLER.** Optical star couplers (of the 6×6 port type and 9 port type) which make possible simultaneous intercommunication among a plurality of terminals have been developed. The star couplers are of the outer reflection mirror type employing graded index fibers and composed of a 0.25-pitch slab lens and a reflection mirror. The 6×6 port type and the 9 port type have an average insertion loss of 15.6 db and 16.3 db, respectively, and a variation in the loss among terminals of within  $\pm 1$  db. They have the following features: (1) simple structure by using a slab lens; and (2) easy handling with both input and output terminals positioned on the same end. The paper describes the structure, production method and characteristics of these optical star couplers, as well as an example of applications, a network which allows simultaneous communication of digital data and audio-video signals. (Author abstract) In Japanese. 6 refs.

**073753 CONICAL ZONE PLATE.** The phase contribution obtained by the superposition of two tilted wavefronts, one cylindrical and the other plane, is considered in this paper. It is shown that the obtained transmittance is equivalent to the conical lens transmittance. In the particular case when the superposed wavefronts are collinear, the resulting hologram becomes an on-axis conical zone plane, and the loci of the points on the registration plane where the intensity is maximal will be parabolas. The effect of the diffraction on the obtained holograms is calculated (including nonlinear processing of the plate). Additionally, the technique of conical zone plate production is described. (Author abstract) 17 refs.

**073754 ANALYSIS OF THE OPERATION OF SURFACE-EMITTING-TYPE OPTICAL THRESHOLD DEVICE.** This paper proposes a surface-emitting-type optical threshold device and analyzes its characteristics. For a surface-emitting laser resonator with a saturable absorber, its static characteristics and small signal analysis with a current or light injection are obtained from rate equations. As a result, the possibility of an optical threshold device which operates with a practical optical energy of approximately 30 kW/cm<sup>2</sup> has been shown. Furthermore, it has been shown that the optical threshold varies by controlling an injection current, and that AND and OR logics are possible with one device. As a result of small signal analysis, the device is shown to have a bandwidth of approximately 1 GHz. (Author abstract) 20 refs.

**073755 DEVELOPMENT OF A FIBROSCOPE MANIPULATOR FOR DUNGENESS 'B' POWER STATION.** The two advanced gas cooled reactors (AGRs) at Dungeness 'B' each have 408 channels containing the fuel. Each fuel assembly is attached to a plug unit which seals the channel opening and supports the fuel during refueling. The plug units also contain a piston valve known as a 'gag' which is used to regulate the gas flow up the fuel channel. In May 1986 it was discovered that incorrect materials had been used in some of the fasteners holding up the gag pistons. A decision was then taken to inspect all the gags to assess the extent of the problem. Removing the gags from the reactor to inspect would be a costly and time consuming process so effort was concentrated on an in-situ inspection. The Barnwood Remote Inspection Group (RIG) were asked to design a manipulator which would inspect gag fasteners under remote control from the reactor charge floor, and to procure it in minimum time. This article discusses a fibroscope manipulator for this purpose.

**073761 ALL-OPTICAL LOGIC IN FIBER SYSTEMS USING NONLINEAR REFRACTION.** We describe the realization of a nonlinear all-optical logic gate and modulator for use in fiber-optics communication systems. The physical mechanisms for the optical nonlinearities and their influences on device operation and design are considered. Results are presented for the AND, NOR, NOT, and XOR logic functions with a better than 20 dB contrast ratio. The gates and modulators exhibit exceptional stability, because no resonator, feedback, or stringent wavelength control are needed. Silicon at  $\lambda = 1.06 \mu\text{m}$  has been used for these 'proof-of-concept' experiments. The feasibility of picosecond operation, multiplexing, and wavelength translation is discussed. **073767 1×6 OPTICAL SWITCH FOR SINGLE-MODE FIBERS.** Optical communication systems using single-mode fibers, which feature a large capacity and low loss, are expected to have a large future demand. A 1×6 optical switch has been developed for the systems. The optical switch employs parallelogram prisms for switching optical paths in order to decrease the fluctuation of insertion losses. The prism combination and the proper length of the parallelogram prisms allow low difference of insertion losses and low crosstalk between channels. The insertion loss is less than 1 db. The fluctuation and difference of the insertion losses are less than 0.04 db and 0.3 db, respectively. The crosstalk is less than -72 db. The optical switch makes it possible to build various optical communication systems, and its application to optical measuring instruments is expected. (Author abstract) In Japanese. 8 refs.

**073768 OPTICAL COUPLER AND MULTI/DEMULTIPLEXER FOR SINGLE-MODE FIBERS.** An optical coupler and a multi/demultiplexer both for single-mode fibers have been developed. The optical coupler is used to branch an optical signal from one optical fiber to two optical fibers. It is composed of a non-randomly polarized light beam splitter and a graded index rod lens. With a laser diode (LD) as the optical source, it has an insertion loss of less than 3.5 db, a loss variation of 0.1 db, and a channel isolation of more than 30 db. The optical multi/demultiplexer is used for wavelength division multiplex transmission, and has a function of multiplexing or demultiplexing different optical wavelength. It is composed of a flat parallel surface prism, a graded index rod lens, and an optical interference filter. In 2-wavelength division multiplex transmission using a LD, it has a pair of transmission losses of less than 2.5 db, a channel isolation of more than 30 db, and near-end crosstalk of less than -40 db. The optical coupler and the multi/demultiplexer feature high performance, and good reproducibility thanks to their simple construction. A preferable result has been obtained in various reliability tests. (Author abstract) In Japanese. 12 refs.

**073769 OPTICAL REPEATER FOR 32Mb/sec LOOP LAN.** A highly-reliable, compact, low-power optical repeater has been developed for 32Mb/sec loop LAN. It is composed of an optical transmitter/receiver, coder/decoder, and RAS (reliability, availability and serviceability) control. For the light source and the detector, a 1.3μm band LED and a Ge-APD are used. The pre-amplifier and the amplifier are composed of two new monolithic ICs. The clock recovery module employs a crystal filter. The coder/decoder circuit, where a coded mark inversion (CMI) coding scheme is applied as the transmission code, uses a TTL gate array, being integrated in a SDIP 28-pin package. The RAS circuit, which detects bit errors and constitutes loop-back, bypass, etc., uses a CMOS gate array, being integrated in a SDIP 48-pin package. The repeater system has a required receiving optical power of -44 dbm (bit error rate=10<sup>-9</sup>), and a level margin of 22 db between the transmitter and the receiver. The repeater makes it possible to build a high-performance and low-cost optical LAN system. (Author abstract) In Japanese. 7 refs.

Components

**073770 PRECISION OPTICAL FABRICATION THROUGH HYBRID PROCESSING.** The optical community uses several methods for fabricating precision optics. By using a combination of these techniques, we can produce many state-of-the-art parts at significantly less than state-of-the-art prices. This economy is achieved by combining the valuable features of one manufacturing technique with the otherwise unavailable but valuable features of an alternative method. The final product benefits from the efficiency and advantages of each technique. The techniques we have found particularly well suited for hybrid processing are precision machining with diamond tools and conventional pitch-and-polish techniques.

Efficiency

**073772 EFFICIENT N×N STAR COUPLER BASED ON FOURIER OPTICS.** A technique for constructing an efficient N×N star coupler suitable for mass production in integrated form for large N at optical frequencies is discussed. The coupler can be realised using Si technology by means of two arrays of strip waveguides

and a dielectric slab formed on a glass substrate. Power transfer between the two arrays is accomplished through radiation in the dielectric slab with theoretical efficiency exceeding 30% under optimised conditions. (Author abstract). 9 Refs.

Dragone, C. (AT&T Bell Lab, Holmdel, NJ, USA). *Electron Lett* v 24 n 15 Jul 21 1988 p 942-944.

Electric Properties

**073773 EFFECTS OF FABRICATION OF AGING ON THE XEROGRAPHIC PROPERTIES OF SQUARINE PHOTORECEPTOR DEVICES.** The effects of a number of fabrication variables on the electrical properties of bilayer squaraine photoreceptor devices have been studied. Our results show that primary squaraine particles, which are 0.1-0.2 μm in size are usually agglomerated in the coating dispersion and the carrier generation layer (CGL). Of the sixteen binders examined, five of them contain mainly aromatic functionalities. The aging characteristics of squaraine devices as a function of binder, CGL thickness, and pigment concentration have also been investigated. Seasonal fluctuations in dark decay and charge acceptance are seen for all devices. This seasonal fluctuation is shown to be a humidity effect and is found to be sensitive to CGL binder, pigment concentration, and CGL thickness. (Edited author abstract) 18 refs.

Laser Applications

**073775 DENSELY SPACED WDM COHERENT OPTICAL STAR NETWORK.** An optical WDM star network consisting of three lasers transmitting at about 234,000 GHz, spaced by 300 MHz, has been used to demonstrate dense packing of WDM signals. The three optical signals, FSK-modulated at 45 Mbit/s, are multiplexed by a 4×4 star coupler and demultiplexed by a balanced heterodyne receiver. Receiver sensitivity is -61 dbm for a BER of 10<sup>-9</sup> or 113 photons/bit, which is 4.5 db from the shot noise limit. The results indicate that 100,000 users in a 10 km radius could be interconnected with such a system. (Edited author abstract) 8 refs.

**073785 RELATION BETWEEN INPUT AND OUTPUT STATES FOR A BEAM SPLITTER.** The state of the optical field at the output of a beam splitter is expressed directly in terms of the state at the input via the diagonal coherent state representation. The conclusion is illustrated for a two-photon Fock state, and it is shown that an output having some features of the two-photon singlet state can be produced. (Author abstract) 6 refs.

## Optical Properties

**073786 POLARIZATION BISTABILITY IN A HYBRID DEVICE SIMULATING A NONLINEAR BIREFRINGENT CAVITY.** Polarization bistability can be achieved in a resonant cavity containing a nonlinear birefringent material. A hybrid opto-electronic device was constructed in order to simulate the behavior of such a

system and to study its response in terms of a number of system parameters. Intensity driven polarization switching as well as polarization driven intensity switching are demonstrated as examples. (Author abstract) 7 refs.

## Performance

**073787 SINGLE-MODE FIBRE Y-JUNCTION BEAM-SPLITTER.** The fabrication operation and performance of a wavelength-independent single-mode fiber beam-splitter is discussed. Equal power splitting over an indefinitely broad spectral range is possible with this device, which has a tapered Y-junction configuration. (Author abstract) 7 refs.

Minelly, J.D. (Univ of Southampton, Southampton, Engl); Hussey, C.D. *Electron Lett* v 23 n 20 Sep 24 1987 p 1087-1088.

**073788 PERFORMANCE OF GALLIUM PHOSPHIDE BRAGG CELLS.** The design, fabrication and evaluation of efficient wideband Bragg cells in gallium phosphide is reported. The devices were fabricated using the  $<110>$  and  $<111>$  longitudinal modes of acoustic propagation with design bandwidths of 500 MHz centered on 1.2 GHz. Very high diffraction efficiencies of 115%/W and 210%/W, respectively, were obtained. The devices were characterized in terms of two tone third order intermodulation products, which are shown to be consistent with being caused by acoustic mixing. Other results reported include measurements of acoustic attenuation, the acoustic anisotropy factor and optical scatter. (Edited author abstract) 10 refs.

Bagshaw, J.M.; Lowe, S.E.; Willats, T.F. *GEC J Res* v 5 n 3 1987 p 171-175.

**073789 PERFORMANCE OF OPTICAL RECEIVERS INCORPORATING MULTIEMISSION SUPERLATTICE AVALANCHE PHOTODIODES.** Recently interest has been expressed in superlattice avalanche photodiodes (SAPDs) in which the initiating carrier can impact more than one ionisation per stage, as a further step towards the solid-state photomultiplier. This letter indicates that these advanced SAPDs are likely to offer improved receiver sensitivity, compared with normal SAPDs, only if the residual hole ionisation is kept to an extremely low value. (Author abstract) 8 refs.

**073790 DELAY LINES FOR OPTICAL PULSE SEQUENCE FORMATION.** The problem of forming two or several series of a sequence of pulses, including forming an optical vernier, occurs in the development of pulse, pulse-phase, and phase-pulse range-finder technique. To assure strict phase pinpointing it is expedient to form these series of sequential multiple division operations of the original pulse into direct and delayed. In this case the instrumental component of the measurement error can be removed because of assurance of the equality of the amplitudes and stability of the pulse repetition rate in the series or sequences formed. This effect can be achieved by using the physical features of certain optical delay lines. The proposed method for investigating such delay lines is based on a representation of the original signal and the individual signal components at the delay line output by  $\delta$ -functions of the corresponding delay times governed by the geometric pathlength which the signal traverses. 4 refs.

## Physical Properties

**073791 PROPERTIES OF MULTILAYERS FOR SOFT X-RAY OPTICS.** An appropriate physical description of multilayer structures to be used as soft x-ray optical elements is necessary to ensure agreement of

predicted and actual performance. Deviations of the fabricated structures from an ideal design (interfacial roughness and diffusion, microvoids, impurities, thickness errors) degrade the reflectance properties. Deviations of the physical properties of very thin films from those of the bulk materials can limit the validity of reflectance calculations. We describe these difficulties and how a particular fabrication-characterization procedure can help solve them. Characterization techniques used include a variety of x-ray diffraction techniques, Rutherford backscattering spectroscopy and Transmission Electron Microscopy. Results obtained for samples prepared by triode magnetically confined dc sputtering are given. The implication of these results for other multilayer materials is discussed. (Edited author abstract) 10 refs.

## Protection

**073792 TEFLON FILMS FOR PROTECTION OF OPTICAL SYSTEMS IN LASER PROCESSING OF METALS.** In processing of metals by pulsed neodymium lasers, it is necessary to protect the focusing objectives—especially the short-focus objectives—as well as the entrance windows of the chambers from sputtered and evaporated material, which can contaminate or damage the elements of the optical system. Teflon films are used for effective protection of the elements of the optical systems of pulsed neodymium lasers from contamination in metals processing. (Edited author abstract) 4 refs.

## Reviews

**073793 OPTICAL FIBRE-GRATING PULSE COMPRESSIONS.** The article reviews the current state-of-the-art of optical pulse compressors based on the optical fiber-grating pair. As this technique has become a standard laboratory procedure providing pulses with duration shorter than those directly generated from mode-locked lasers, we review the basic mechanism of the method, the role played by additional non-linear effects (such as stimulated Raman scattering), describe the current results, with emphasis to our own work, and point out the limitations of the technique. (Author abstract) 94 refs.

## Selection

**073794 SELECTING SUPPORT EQUIPMENT.** The rapidly expanding areas of application for lasers, electro-optical systems, imaging equipment and fiber optics have brought with them an unprecedented growth in the optical support equipment industry. Today the researcher in photonics-related fields can select support equipment from as many as 20 different suppliers. Photonics system designers have a wide variety of support equipment to select from today. However, this bonanza also complicates the problem of picking the right components for the job at hand.

Spiegel, Gary. *Photonics Spectra* v 21 n 12 Dec 1987 p 82, 84, 86.

## Space Applications

**073795 WIDEBAND 150  $\mu$ S OPTICAL DELAY LINE FOR SATELLITE ALTIMETRIC RADAR CHECKING.** A 1.3  $\mu$ m optical delay line providing a 150

$\mu$ s delay time in the spectral range 200-600 MHz has been realized using a 30 km-long single-mode fiber. The aim of this delay line is the ground test of an altimetric radar to be implemented in the oceanographic satellite Topex-Poseidon, whose launch is scheduled for the end of 1991. (Author abstract) 5 refs.

**Stability** See Also LASERS, SEMICONDUCTOR—Stability; LIGHT—Nonlinear Optical Effects.

**073796 NOVEL QUANTUM-WELL OPTICAL BISTABILITY DEVICE WITH EXCELLENT ON/OFF RATIO AND HIGH SPEED CAPABILITY.** A novel optical bistability device is proposed and analyzed in which the Stark effect of a multiple quantum well is used in combination with a negative resistance device. The device is found to possess an excellent on/off ratio (19:1) and high speed capability ( $\tau < 10$ ps), while the required optical power P is as small as 1 mW or less with a bias voltage of 5V, giving a Pr product of 1 to approximately 10 fJ. (Author abstract) 3 refs.

Sakaki, H. (Univ of Tokyo, Tokyo, Jpn); Kurata, H.; Yamanishi, M. *Electron Lett* v 24 n 1 Jan 7 1988 p 1-2.

**073797 OPTICAL BISTABILITY.** This chapter provides an introduction to and an overview of optical bistability. The steady-state characteristics and modes of operation of optically bistable and multistable devices are examined. The theory of passive nonlinear absorptive and dispersive ring and Fabry-Perot cavities is developed and compared with experimental results. Hybrid electro-optic devices and systems which display intrinsic bistability without resonant cavities are surveyed. The complex dynamic behavior of bistable systems is investigated, including: questions of stability, critical slowing down in state switching, overshoot, alternate, and phase switching, self-pulsing due to hysteresis cycling and to positive slope instabilities, and optical chaos. (Author abstract) 380 refs.

**073803 PHOTOPHYSICAL AND PHOTOCHEMICAL SWITCHES BASED ON TWISTED INTRAMOLECULAR CHARGE TRANSFER (TICT) STATES.** TICT states, accessible in twisted multichromophoric systems, are nonradiative funnels to the ground state in many dyes. By controlling these funnels, faster saturable absorbers for subpicosecond laser pulses can be developed. Oriented assemblies of TICT molecules, as in liquid crystalline polymers, are expected to exhibit light-induced macroscopic charge separation. Chemical approaches to supramolecular bistable species are also shown. (Author abstract) 30 refs.

Rettig, W. (Technische Univ Berlin, Berlin, West Ger). *Appl Phys B* v B45 n 3 Mar 1988 p 145-149.

**073804 SWITCHING DYNAMICS OF OPTICAL BISTABLE DEVICES.** The switching dynamics of optical bistable devices is studied and some recent results are reviewed. It is shown that it is relatively easy to switch rapidly a bistable pixel monitored by a cw beam by adding the exact amount of energy. This switching time can be much faster than the relaxation time  $\tau_r$  of the nonlinear material. However, when the device is switched, the characteristic time which drives the system is  $\tau_p$ , so that the reverse switching time should be of the order of this relaxation time. This reverse switching is obtained by a decrease of the holding intensity which can be achieved by cutting the holding cw beam. 63 refs.

**073805 ROOM-TEMPERATURE SINGLE-WAVELENGTH OPTICAL LATCHING CIRCUITS USING GaAs BISTABLE DEVICES AS LOGIC GATES.** Room-temperature two-element latching circuits are experimentally demonstrated using GaAs multiple-quantum-well (MQW) nonlinear etalons under single-wavelength bistable operation. Signal power gains of up to 4 and contrast ratios of 10 have been achieved at milliwatt power levels with 1- $\mu$ s pulses, which will allow the construction of more complicated digital optical circuits using diode lasers as the light sources. The problems of applying these nonlinear etalons to fast optical signal processing are also discussed. Numerical simulations

show that the gain vanishes as the pulse duration decreases and approaches the carrier lifetime. (Author abstract) 24 refs.

**073810  $1 \times 2$  OPTICAL SWITCH FOR WDM TRANSMISSION SYSTEMS.** A  $1 \times 2$  optical switch, which also functions as wavelength demultiplexer is designed and experimentally fabricated utilizing a phase plate and a twisted nematic liquid crystal. Measured insertion loss, crosstalk attenuation, and transit time are < 1.5 db, > 17.6 db, and < 80 ms, respectively. (Author abstract) 2 refs.

Fujii, Y. (NTT Lab, Kanagawa, Jpn). *Electron Lett* v 24 n 18 Sep 1 1988 p 1153-1154.

**073811 WAVELENGTH-DIVISION-MULTIPLEXING OPTICAL SWITCH USING ACOUSTOOPTIC DEFLECTOR.** A wavelength-division-multiplexing (WDM) optical switch that requires minimal hardware and is applicable in high-speed signal switching has been developed. Theoretical calculations based on Gaussian beam approximation show that up to a  $20 \times 20$  switch is possible using present technology. As a preliminary study, a  $3 \times 3$  WDM switch was constructed. Crosstalk of this switch is found to be less than -20 dB, and a 500 Mb/s return-to-zero signal is successfully switched with a 4- $\mu$ s switch access time. A large-capacity switching network using this WDM optical switch is proposed. 11 refs.

Shimazu, Yoshihiro (NTT, Kanagawa, Jpn); Nishi, Shigeto; Yoshikai, Noriaki. *J Lightwave Technol* v LT-5 n 12 p 1742-1747.

**073812 GUIDED-WAVE OPTICAL GATE MATRIX SWITCH.** An optical gate matrix switch that is made by integrating InGaAsP laser diode gates with high-silica guided-wave splitter and combiner circuits in a hybrid fashion is proposed and demonstrated. It provides point-to-multipoint switching. A preliminary experiment for a  $4 \times 4$  matrix switch shows that the switch is capable of more than 400-Mb/s bandwidth signal switching. 11 refs.

#### Testing See INTERFEROMETRY.

#### Transients

**073815 TRANSIENT RESPONSE OF AN ELECTRICALLY ADDRESSABLE NONLINEAR BISTABLE OPTICAL DEVICE.** This note describes an experimental study of the transient response of this device when it was subject to square wave voltage pulses and identifies the mechanisms dominating the overall switching time at varying values of driving voltage, initial dc biasing and optical input power. The device consisted of a Fabry-Perot etalon containing the nematic liquid crystal mixture 3/5/7 PCH. Results are presented which show that the transient characteristic is composed of three regions, a purely electro-optic part where the cavity intensity does not change (region 1), followed by a slow change in cavity intensity brought about by the electro-optic and nonlinear effects (region 2), with a final fast switch up to the high transmission state (region 3). 14 refs.

**073817 MODIFIED SZ STRANDING OF OPTICAL FIBRE CABLE CONDUCTORS.** Analysis of all well-known stranding methods revealed that SZ stranding with synchronous pulleys in modified form best satisfies all product-specific and production requirements in the stranding of optical fiber cable conductors. A length compensator mounted between the unwinding bobbins and the SZ infed synchronously counteracts the non-uniform speeds of the individual conductors in stranding machines operating on this principle. The production speeds are higher with this method than with the conventional ones. (Author abstract) 4 refs.

Schmitz, Hans-Joachim. *Wire World Int* v 29 n 1 Jan-Feb 1987 p 10-12.

**073818 DRUM TWISTER FOR STRANDING OF OPTICAL FIBRE CABLES.** For the stranding of sensitive products such as optical fiber cables the manufacturer can make a choice between cage machines, single twist cablers, SZ stranders, and drum twisters. The outstanding advantages of the drum twister include extensive flexibility on the pay-off side, low-deflection guiding and the possibility of disruption-free backtwisting of the sensitive stranded product. Optical splicing units such as a TV camera built into the rotating take-up permit the accurate observation of the winding quality at the stranding point. With the aid of various handling devices and different drive solutions a drum twister can be built into a computer-controlled stranding plant. (Edited author abstract) 5 refs.

Bruns, Klaus H. *Wire World Int* v 29 n 1 Jan-Feb 1987 p 13-16.

**073819 EFFECTIVE SPLICING FOR OPTICAL COMMUNICATION.** The capability to splice fibers with minimal loss is fundamental to fiber optics. The 'Placotic' splicing system uses a rectilinear section alignment block rather than the conventional V-groove. This ensures more accurate alignment in the y-plane. Alignment in the x-plane is assured by the elastomeric material with which

the block is made. This centers the two fibers whatever their outside diameter may be. The fibers are automatically aligned by the reactive forces which result from distortion of the elastomer.

Kidd, Trevor (K-Tech Micro Precision); Smith, Dave. *New Electron* v 20 n 15 Jul 21 1987 p 25-26.

**073820 ADVANCES IN BLOWN FIBER INSTALLATION METHODS.** The blown fiber method has recently been introduced into British Telecom operating districts as a means of providing optical point-to-point cable links. This paper, describes some laboratory advances in the blown fiber installation technique which will enable the system to be applied across the whole range of local network applications, including connecting the customer directly to the exchange. The first part of the paper examines the duct utilization of blown fiber tubing; recommendations are made on the use of smaller bore blowing tubes to improve heads in series, and single head blowing with fiber unit delivered from toroidal pans rather than drums. Route lengths in excess of 2 km are now possible using either of these methods. (Author abstract) 6 refs.

Freeman, R.A.; Jenkins, P.D.; Stockton, D.J.; Wiltshire, B. *Br Telecom Technol J* v 5 n 3 Jul 1987 p 19-24.

**073821 BEHAVIOUR OF  $EH_{11}$  AND  $HE_{11}$  WAVE MODES IN A THREE-LAYER OPTICAL FIBRE.** Many guided-wave optical transmission systems employ fibers having a slight depression of the refractive index along the axis of the core. This has been shown to have comparatively little effect on the  $HE_{11}$  mode normally used for propagation but, according to the present paper, any slight axial depression of the refractive index permits the appearance of an anomalous  $EH_{11}$  mode at the lower end of the frequency spectrum. The behavior of this anomalous wave is examined and described; it is found to disappear completely when the core remains homogeneous. (Author abstract) 7 refs.

Barlow, H.M. (Penrith, Epsom, Engl). *J Phys D* v 20 n 10 Oct 14 1987 p 1232-1236.

**073822 CHARACTERISTICS OF DISPERSION-SHIFTED FIBERS.** The bending properties of dispersion-shifted fibers with dual shape cores are theoretically and experimentally investigated. A bend-optimized dual shape core fiber is achieved for a large mode field diameter of 8.6  $\mu\text{m}$ . It is clarified that its dispersion controllability is better in dual shape core fibers than in  $\alpha$ -index dispersion-shifted fibers. (Author abstract) 10 refs.

Ohashi, Masaharu (NTT, Jpn); Kuwaki, Nobuo; Uesugi, Naoshi. *Rev Electr Commun Lab (Tokyo)* v 35 n 5 Sep 1987 p 535-539.

**073823 FLUORINE IN MCVD OPTICAL FIBERS.** Fluorine incorporation in silica glass network has been investigated using  $\text{CCl}_2\text{F}_2$  (Freon-12) as a source. Considerations on the stoichiometry of the reactions involved in CVD processes and experimental results on the refractive index are detailed. The data are collected in a ternary diagram that is proposed as a useful graphic representation in order to identify iso-index curves. (Author abstract) 8 refs.

**073824 FIBRE OPTIC SENSORS.** Apart from their use in communication links, optical fibers can be used as sensors for the measurement of various physical properties. This is because of the dependence of the refractive index of the fibre on physical parameters like temperature, pressure, strain, etc. Some topics discussed are these: a classification of fibre optics sensors (amplitude modulation, phase modulation, polarisation modulation, time resolved, and wave length modulation); components for the FOS systems; applications; and the optical phenomenon and the modulation of light. 23 refs.

**073825 EFFECTIVE CUTOFF FREQUENCY OF LP<sub>11</sub> MODE IN UNIFORMLY CURVED STEP-INDEX OPTICAL FIBERS.** This paper evaluates the field distribution and the propagation constant of the  $LP_{11}$  mode propagated in circularly bent step-index optical fibers by considering these quantities as perturbations from those in the straight fiber. By using these results, the field distributions and the curves of solutions of the eigenvalue equations for the bent fiber are studied in detail based on numerical and physical considerations. On the basis of this study, a reasonable method is proposed for defining the effective cut-off frequency of the  $LP_{11}$  mode in a circularly bent section of a step-index fiber. (Edited author abstract) 16 refs.

**073826 MEASUREMENT OF MODE FIELD RADIUS USING EQUIVALENT VARIABLE APERTURE METHOD IN FAR-FIELD OF SINGLE MODE FIBERS.** An equivalent variable aperture method for mode field radius measurement of single mode fibers is proposed. It involves measurement of the integrated far-field distribution with a circular aperture moved axially in the far-field of the fiber. In addition, calculation method of the mode field radius, which is also suitable for non-Gaussian field distributions, is derived by using Petermann's new definition of mode field radius. Experiments have shown that this method is simple and reliable. The typical deviation of repeated measurements of the mode field radius of a given fiber with different ends is less than 0.04  $\mu\text{m}$ . (Author abstract) In Chinese. 6 refs.

**073827 BENDING LOSS CHARACTERIZATION IN SINGLE-MODE FIBRES.** An experimental characterization of bending sensitivity in single-mode fibres has been carried out by means of two distinct approaches. In the former the first measurement technique for the spot-size  $w_0$ , that describes both macro- and microbending losses, is proposed. In the second approach the microbending loss has been measured directly in a realistic configuration, determining the statistical properties of the phenomenon. (Author abstract) 9 refs.

**073828 SPECTRAL AND TEMPORAL INVESTIGATION OF SELF-PHASE MODULATION AND STIMULATED RAMAN SCATTERING IN A SINGLE-MODE OPTICAL FIBRE.** An investigation of the spectral and temporal characteristics of the self-phase modulated pulses exiting from a germania-doped fused-silica-core single-mode optical fibre has been undertaken at 1.064  $\mu\text{m}$ . For peak powers below the stimulated Raman scattering threshold the spectral data were in excellent agreement with a simple theory developed for negligible fibre group-velocity dispersion and symmetrical chirp-free input pulses. For elevated peak-power levels a complementary study of the temporal and spectral features of the first-order Stokes Raman and pump pulses has been carried out. It was observed that the onset of stimulated Raman scattering leads to both spectral and temporal pump-pulse asymmetry and hence to deviation from the theoretical spectral predictions. In addition, a simple fibre Raman oscillator was constructed and its characteristics are described in some detail. (Author abstract) 19 refs.

**073829 OPTICAL PULSE COMPRESSION OF**

**RAMAN-DEPLETED PICOSECOND PULSES AND SPECTRALLY WINDOWED SELF-PHASE MODULATED PULSES AT 1.06  $\mu\text{m}$ .** Two pulse-shortening schemes based on the nonlinear propagation of picosecond pulses from a Nd: YAG laser in single-mode optical fibres are described. In the first experiment, a spectral-windowing technique was employed to compress self-phase modulated pulses exiting 100m of optical fibre, and compression factors of 2.5 were recorded in good agreement with theoretical predictions. In the second experiment, cascaded stimulated Raman generation, occurring when a high-power pump pulse propagated in 4 m of fibre, was studied. Lower-order components in the cascade were severely depleted through generation of higher-order Stokes signals, leaving negatively chirped pulse fragments. These were compressed with a dispersion-tunable Gires-Tournois interferometer and compression ratios of times 4 were obtained. (Edited author abstract) 34 refs.

**073835 EFFECT OF A REFRACTIVE-INDEX GRADIENT ON THE CHARACTERISTICS OF A SINGLE-MODE OPTICAL FIBER.** Single-mode lightguides with a large difference in the refractive indices of the core and cladding ( $\Delta n$  approximately 3%) and a small core radius ( $R$  approximately 1.5  $\mu\text{m}$ ) can provide a first-order dispersion that is close to zero over a wide range of wavelengths. It is of interest to investigate methods of reducing the modulus  $501 S_1$  of the first-order dispersion at one wavelength for lightguides that are more feasible to manufacture with  $\Delta n \leq 0.5\%$  and  $R$  approximately 5  $\mu\text{m}$ ; this will make it possible to transmit information at a rate of hundreds of Gbits/sec. The effect of the variation of the refractive index along the radius of a lightguide on its dispersion characteristic was investigated earlier i.e., the above problem can be solved by choosing an appropriate variation of the refractive index. We will show this for the case of a lightguide, the cladding of which is made from pure  $\text{SiO}_2$  while the core has a diameter of  $2R = 10 \mu\text{m}$  and is made from  $\text{SiO}_2$  with a maximum concentration of 3.1% for a  $\text{GeO}_2$  impurity. 6 refs.

**073836 CALCULATION OF RADIATION LOSS IN SINGLE MODE FIBERS BY EQUIVALENT CURRENT METHOD.** Taking a non-ideal waveguide as an ideal waveguide in the presence of polarization currents giving rise to electric and magnetic fields, we can directly solve the problems of mode coupling and radiation loss of an optical waveguide. By using this method, we have calculated the radiation loss of single mode fibers caused by periodical and random non-uniformities of the core index. It is an alternative method of coupled mode theory, but is mathematically simpler and physically more intuitive than the coupled mode theory. At last, taking bending and microbending loss for single mode fibers as an example, we see that this method also applied to problems which can be solved by generalized coupled mode theory. **073839 ALIGNMENT OF POLARISATION-MAINTAINING FIBRES BY TEMPERATURE MODULATION.** High birefringence polarization-maintaining optical fibers only preserve polarization if all the light is launched into one or other of the two principal propagation modes. At present, the most widely used alignment technique is time-consuming and can give ambiguous results for narrow linewidth sources. A novel non-destructive technique for rapidly aligning stress effect high birefringence polarization-maintaining fiber is described. Temperature modulation is applied to a short length of fiber, giving alignment to better than  $0.5^\circ$ , and enabling the fast and slow axes to be identified. The technique is best suited to narrow linewidth sources, but it is also applicable for the tailing of short lengths of fiber to most laser sources. (Author abstract) 21 refs.

**073841 SELF-SUPPORTING AERIAL FIBER OPTIC CABLE.** The Fibrespan optical cable design is based on a single rod of fiber reinforced plastic (FRP) with a tensile strength of 65 kN, which is three times the design maximum for operation of 22.5 kN. The FRP rod has a longitudinal slot in which ribbons containing up to 24 fibers are laid in a thixotropic gel to cushion them, a polyethylene slot cap which restores the circular profile, and the whole is covered by a binder yarn and outer sheath. The single mode fibers used in this cable operate at 1300 nm with 0.5 dB/km attenuation or better and a pulse dispersion factor of not more than 3.5 dB/km. The nm/cable with an outer diameter of 13 mm weighs 220 kg/km and has an operating temperature of  $-40^\circ\text{C}$  to  $70^\circ\text{C}$ . Two types of Translite cable self-supported by FRP rod are manufactured, a 250 kg/km long span circular section cable, and a 240 kg/km short span version.

**073853 MULTIMODE OPTICAL FIBER SPLICE LOSS: RELATING SYSTEM AND LABORATORY MEASUREMENTS.** An examination is made of the splice loss occurring along a multimode fiber regenerator and the results are compared to a 'standard' laboratory test condition. Large variations in the splice loss sensitivity to transverse offset of a reference splice were seen (1) at the ends of five different 8.9-km fiber concatenations and (2) at various locations along one 8.9-km path. These data indicate that significant variations in the modal power distribution exist even at the receiver end of a regenerator span. This is explained by the long coupling lengths (long compared to splice spacing) of low-loss fibers and the random amount of mode coupling introduced by the concatenation splices. 18 refs.

Peckham, David W. (AT&T Bell Lab, Norcross, GA, USA); Lovelace, Charles R. *J Lightwave Technol* v LT-5 n 11 p 1630-1636.

**073854 LIGHT CONVERSION IN NONLINEAR MONOMODE OPTICAL FIBERS.** A complementary analysis of the four-wave mixing phenomenon in monomode optical fibers is undertaken. Its central aspect is the interdependence between the amplitudes and the relative phase of the four waves. An expression for the spontaneous emission in terms of the pump power is derived. Investigating the pump depletion, it is shown that for short fibers a certain degree of total phase mismatch can be advantageous to the amplification of weak Stokes and anti-Stokes signals. Also, the optimal fiber length depends on the initial relative phase. 24 refs.

**073863 MEASUREMENTS OF MODE FIELD RADIUS IN SINGLE-MODE FIBRES BY MEANS OF HARMONIC ANALYSIS.** A new technique for mode field radius measurement of easy implementation is presented. It is based on a dynamical filtering of the output radiation and a suitable harmonic evaluation. The preliminary results are exposed. (Author abstract) 5 refs.

Coppa, G. (CSELT, Turin, Italy); Di Vita, P.; Potenza, M. *CSELT Tech Rep* v 13 n 5 Oct 1985, IOOC-ECOC '85 (5th Int Conf on Integr Opt and Opt Fibre Commun - 11th Eur Conf on Opt Commun), Venice, Italy, Oct 1-4 1985 p 309-311.

**073864 FAST HETERODYNE INTERFEROMETER FOR REAL-TIME FIBRE POLARIMETRY.** A fast polarimeter operating in heterodyne mode is presented, for single mode fibre characterization. The polarization measurement is achieved with an original interferometric arrangement, placed at the output of the fibre. To demonstrate the excellent performance of the system, two different kinds of applications are illustrated: polarization

changes due to mechanical stresses and spectral measurements of polarization noise produced by acoustical vibrations impressed to the fibre. (Author abstract) 9 refs.

**073865 COLLOQUIUM ON NONLINEAR OPTICAL WAVEGUIDES.** This colloquium proceedings contains 12 papers, of which one appears in abstract-only form. Of the topics included, most involve optical fibers in some way, and are as follows: nonlinear propagation effects in silica glass fibers; nonlinear power transmission limit in single-mode optical fibers; laser pulse compression due to self-phase modulation (SPM); nonlinear optical waveguides; including organic polymer; Soliton; Raman, and Neodymium-doped fiber lasers; the application of stimulated Raman scattering for optical amplification in Germanium-doped silica optical fibers; laser pump pulse depletion and compression; and a capillary waveguide laser. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 09349 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

## Aging

**073866 HYDROGEN IN FIBERS: A COMPARISON BETWEEN THE AGING AND THE SIMULATED AGING.** The optical attenuation caused by interaction between hydrogen and optical fibers, at a constant pressure in the temperature range 20°-100°C, has been studied to verify the simulation of aging by temperature increase. Relations between percentual differences in time and temperatures were obtained, and were compared with measurements on a high Ge-doped multimode fiber. Only one of three observed effects seems to be correctly predicted by simulation. (Author abstract) 7 refs.

**073867 MODEL FOR HYDROGEN AGING IN MULTIMODE FIBERS.** In order to explain the variation of initial aging rate on the square root of the hydrogen pressure observed in two other studies, a model based on the production of hydrogen atoms by some defect site in the glass is developed. The model is then successfully tested against the detailed temporal behavior that was reported for fibers containing high levels of phosphorus as well as those containing low levels. 6 refs.

**073868 TABLES OF INTEGRALS: MISPRINT IN A CONVOLUTION-TYPE INTEGRAL WITH GAUSS-LAGUERRE FUNCTIONS.** The solution of a convolution-type integral with Gauss-Laguerre functions has turned out to be wrong due to a misprint. So far as we know this error appears in the tables of Gradstein and Ryzik, Magnus et al., Oberhettinger and Prudnikov et al. We did not succeed in proving the correct formula in all generality, but we have demonstrated with four special cases the correct structure of the solution. Gauss-Laguerre functions are of interest when treating fiber-optic problems theoretically or experimentally. (Edited author abstract) 10 refs.

**073869 EFFECT OF HIGHER ORDER MODES ON PULSE WAVEFORM IN A MULTIMODE OPTICAL FIBER.** A Gaussian pulse propagated through a multimode optical fiber is explained by introducing a weighting function of higher order modes into the theoretical formula, being consistent with experimental results. Extending the equation of the pulse propagation in a single mode fiber into that for the multimode fiber, the calculated waveform with several weighting functions is compared with the experimental pulse of a He-Ne fiber. Consequently, the most appropriate weighting function is found to be hyperbolic function  $W(l)=1-0.7$ , which depends only on the radial mode  $l$  and is independent of the azimuthal mode  $m$ . The physical interpretation about the obtained weighting function is discussed. (Edited author abstract) 15 refs.

**073870 BIREFRINGENCE IN STRESS-APPLIED POLARISATION-MAINTAINING OPTICAL FIBRES.** Simple, analytical expressions are presented for the calculation of the birefringence in stress-applied polarization-maintaining optical fibers. The method is based on the vector analysis of propagation constants in dielectric waveguides with perturbed refractive-index profile. It is shown that present results agree with the results obtained using the finite-element method. (Author abstract) 4 refs.

**073871 NEW BENDING LOSS FORMULA EXPLAINING BENDS ON LOSS CURVE.** A new bending loss formula for single-mode fibers is presented. Comparison with measurements and conventional theory shows good agreement. Reported bends on the loss curves for matched- and depressed-clad fibers are explained. (Author abstract) 6 refs.

Andreasen, S.B. (Technical of Univ of Denmark, Lyngby, Den). *Electron Lett* v 23 n 21 Oct 8 1987 p 1138-1139.

**073872 SPOT SIZE, ADIABATICITY AND DIFFRACTION IN TAPERED FIBERS.** A simple formula is given for the maximum spot size achievable by down tapering a single-mode fiber, regardless of core profile. When the fundamental-mode field is approximately Gaussian, the maximum taper angle associated with minimal loss of spot-size power on a finite-length taper is the classical diffraction angle for a beam passing through a circular aperture. (Author abstract) 7 refs.

**073873 FAST ALGORITHM FOR TRANSVERSELY INHOMOGENEOUS OPTICAL FIBERS USING POWER METHOD AND FAST FOURIER TRANSFORM.** A scalar-field integral equation is employed to find the propagation characteristics of guided modes of an inhomogeneous optical fiber of arbitrary transverse shape. Two facts make the proposed method quite efficient. First, by employing the scalar-field integral equation, the propagation problem is reduced to a standard eigenvalue problem, where the lower-order modes correspond to the larger eigenvalues. Hence, the eigenproblem can be manipulated efficiently by variants of the power method. Further, the major computation in the associated power method can be arranged into the form of a convolution, which in turn can be performed using the fast Fourier transform (FFT). (Author abstract) 16 refs.

**073874 CONSIDERATIONS ON GROUP DELAY FITTING EQUATIONS FOR DISPERSION-SHIFTED FIBRES.** Chromatic dispersion measurement accuracy was examined experimentally for four kinds of group delay fitting equations which have been proposed to

date. It was found that the five-term Sellmeier equation is appropriate for dispersion-shifted fibers with various refractive index profiles. It was demonstrated that the maximum difference in zero dispersion wavelength among the four equations is less than 0.67 nm by selecting six measuring wavelengths between 1.49  $\mu$ m and 1.59  $\mu$ m using the LD phase-shift method. **073875 STATISTICAL CHARACTERISTICS OF THE NONLINEAR EVOLUTION OF A RANDOM PULSE IN A FIBER LIGHTGUIDE.** The evolution of the correlation function of a random pulse, transmitted along a lightguide in a nonlinear regime, is investigated and the laws governing the variation of its intensity, duration and other parameters along the lightguide as a function of the degree of nonlinearity, coherence interval of the input pulse and modulation frequency, are determined in a Gaussian approximation. The boundaries of the nonlinear stabilization and pulse compression regimes are determined. (Author abstract) 11 refs.

**073877 ON THE PROPAGATION OF SOLITONS IN COUPLED OPTICAL FIBERS.** Solitons - envelope pulses for which the effects of group dispersion and nonlinearity of the refractive index on accuracy are counterbalanced - have been suggested for use in high-speed transmission of information along optical fibers. In the development of communication systems using solitons it is necessary to build information branching devices. The directional coupler is one such traditionally used device. The operation of such a coupler in the soliton regime is investigated. 2 refs.

**073879 THEORY OF TAPERING SINGLE-MODE OPTICAL FIBRES BY CONTROLLED CORE DIFFUSION.** The feasibility of tapering the core of a fluorine-doped monomode fibre by controlled thermal diffusion is investigated. Numerical calculations suggest that operating temperatures of 1100-1600°C for heating times of less than one hour should produce substantial broadening of the fundamental mode field. Experimental

measurements have confirmed the effect. Implications for optical connector technology are discussed. (Author abstract) 8 refs.

**073883 TRANSMISSION OF A SURFACE PROFILE THROUGH A SINGLE OPTICAL FIBER.** An optical method which allows the transmission of a 2-D surface profile through a single optical fiber is presented. The system performs a double encoding of the surface: in a first step a white light interferogram is used to store the relief. In a second step a chromatic encoding is used to introduce, in real time, the 2-D interferogram in a single multimode fiber. The number of transmitted pixels is limited by the luminosity of the image. (Edited author abstract) 11 refs.

**073885 OPTICAL FIBRE-GRATING PULSE COMPRESSION.** Numerical simulation is used to consider nonlinear pulse propagation in fibres and subsequent pulse compression in a dispersive delay line. It is shown that for small initial pulse powers the conventional non-linear Schroedinger equation (NSE) is accurate to describe the process of pulse propagation in fibres. In this case initially symmetrical pulses undergo squaring and spectral broadening in fibres, and frequency chirp is linearized over most of the pulse, while shapes of the pulse, spectrum and frequency chirp remain symmetrical at the output of the fibre. There is a certain optimum fibre length  $Z_{opt}$  which is determined by the initial pulse parameters and fibre characteristics for pulse compression in the dispersive delay line. Spectral windowing of the extreme Stokes components of the pulse spectrum permits significant improvement in the quality of the compressed pulse. The main features of the compression of pulses with asymmetrical initial shape are considered. (Edited author abstract) 27 Refs.

**073886 EVALUATION OF MODE-FIELD-DIAMETER DEFINITIONS AND CONDITIONS FOR SINGLE-MODE FIBERS BY TRANSMITTED FIELD PATTERN METHODS.** This paper investigates the relative effectiveness of three different definitions of mode-field diameter in evaluation of splice losses of current and dispersion-shifted fibers. As a result, it is shown that the difference in splice losses, due to various definitions, increases with decreasing V value. Further, it is confirmed theoretically and experimentally that by using Petermann's new definition, it is possible to estimate the splice loss very well. Next, using near-field pattern (NFP) and far-field pattern (FFP) methods, the measurement conditions of mode field diameter are also investigated. As a result, it is shown theoretically and experimentally that to keep the measurement error below 1 percent, it is necessary for the dynamic ranges of NFP and FFP methods to be larger than 25 and 35 dB, respectively. Under these conditions, it is shown that the measured results of both methods are in good agreement. (Edited author abstract) 8 Refs.

**073887 FEMTOSECOND ALL-FIBRE COMPRESSOR.** An all optical fiber pulse compressor operating in the femtosecond regime is presented for the first time. Commencing with 100 ps pulses from a cw mode locked Nd:YAG laser operating at 1.3  $\mu$ m, pulses of 130 fs were generated in a standard single mode fiber through a single pass multi-soliton Raman compression. These pulses were further compressed in a two-stage dispersion shifted fiber arrangement. Pulses as short as 65 fs were generated. (Author abstract) 20 refs.

**073888 SECOND GENERATION FIELD TEST EQUIPMENT.** As optical fiber moves steadily toward a wider installed base in a variety of applications, pointing toward the subscriber loop, the requirements for test equipment to be used in outside-plant and maintenance operations present many new challenges to test instrumentation designers. This article discusses some of the requirements for a second generation of optical fiber field test equipment. The article asserts that a field test instrument should be compact, portable, and capable of doing more work in less time with a minimum of operator background and training.

**073890 DISTRIBUTED FLUID SENSOR USING ECCENTRICALLY CLADDED FIBERS.** By using optical fibers as liquid sensors, it is possible to monitor the leakage of oil tanks, pipelines, etc., safely and reliably because it is nonexplosive and chemically inactive. In this paper, the eccentrically clad fiber is proposed as a means to increase the sensitivity without the need to reduce its diameter. The theoretical analysis and its experimental verification are carried out. As a result, it is shown that if the eccentricity is increased, the sensitivity will not decrease remarkably, even at large cladding diameters. Further, as experimental evidence of liquid detection, optical losses of a few decibels per centimeter were observed by attaching a liquid to the fiber. This indicated the possibility of highly sensitive distributed-type sensors. (Edited author abstract) 14 refs.

**073893 FIBER FINDS A NICHE IN PROCESS CONTROL.** Since it first found commercial use in measurement and control applications, optical fiber has managed to keep a foot in the door of the process-control market. Applications have been concentrated in areas of sensing and transmitting the status and values of process variables and communicating this information to operators and management. However, while the potential has been large, realization has been small. This article discusses the essence of industrial process control and some fiber optics applications to this field.

Moore, John A. *Photonics Spectra* v 21 n 12 Dec 1987 p 57-58, 60.

**073894 USE OF OPTICAL FIBER IN SAFETY-SYSTEM DESIGN.** This paper summarizes the design, installation, and performance of an optical-fiber safety system installed for testing purposes on a production platform in the Gulf of Mexico. This system was installed on a chemellectric treater to monitor five end devices and to determine the feasibility of using fiber optics rather than pneumatics or an electrical system in a harsh environment. Included with a performance summary is a brief history of optical fiber and the potential for these types of safety systems in oilfield applications. (Author abstract). 4 Refs.

Kugler, B.A. (Tenneco Oil Co). *JPT J Pet Technol* v 40 n 7 Jun 1988 p 906-908.

**073895 CALIBRATED OPTICAL FIBER POWER METERS: ERRORS DUE TO VARIATIONS IN CONNECTORS.** We discuss potential errors in the measurement of optical fiber power when using a calibrated power meter with connectors of various types and from different vendors. Data are given on the error and standard deviation due to biconic connectors from a limited number of vendors. We speculate that the error is due to reflecting surfaces on the connector end. To confirm the hypothesis, we tested two connectors whose reflective ends have noticeable differences. The data illustrate the variability seen among connectors. Our data indicate that a user should expect measurement error in most cases. We issue a call for caution based on the results. (Author abstract). 1 Ref.

**073896 FIBRE LASER WITH ADJUSTABLE FIBRE REFLECTOR FOR WAVELENGTH TUNING AND VARIABLE OUTPUT COUPLING.** Fibre-loop reflectors are applied to Nd<sup>3+</sup> doped fibre lasers operating in the  $^4F_{3/2} - ^4I_{11/2}$  transition. The splitting ratio of the fused fibre coupler used in a loop reflector is varied thermo-optically, giving rise to a spectral variation in the reflectivity of the device. Using the fibre loop in a configuration with a broadband dielectric mirror to form a resonant cavity, we demonstrate wavelength tuning of the fibre laser and continuously variable power output for a constant pump power. (Author abstract). 14 Refs.

Millar, Colin A. (British Telecom Research Lab, Ipswich, Engl); Miller, Lain D.; Mortimore, David B.; Ainslie, B. James; Urquhart, Paul. *IEE Proc Part J* v 135 n 4 Aug 1988 p 303-309.

**073897 WDM COHERENT OPTICAL STAR NETWORK.** The results obtained with a fiber-optical star network using densely-spaced wavelength division multiplexing (WDM) and heterodyne detection techniques are reported. The system consists of three lasers transmitting at optical frequencies around 234,000 GHz, spaced at a frequency interval of 300 MHz. The lasers are frequency-shift-key (FSK) modulated at 45 Mb/s. A  $4 \times 4$  optical star coupler combines the three optical signals. The WDM signals received from one of the four outputs of the star coupler are demultiplexed by a heterodyne receiver. The minimum received optical power needed to obtain a bit-error rate of  $10^{-9}$  is -61 dBm or 113 photon/bit, which is 4.5 dB from the shot noise limit. The degradation caused by co-channel interference was measured and found to be negligible when the channels,

modulated at 45 Mb/s, are spaced by more than 130 MHz in the IF domain. These results indicate that a WDM coherent optical star network of this type has a potential throughput of 4500 Gb/s. 17 refs.

**073898 STOICHIOMETRIC LiNbO<sub>3</sub> SINGLE-CRYSTAL FIBERS FOR NONLINEAR OPTICAL APPLICATIONS.** A vapor transport equilibration technique has been used to improve the homogeneity and adjust the Li/Nb ratio in small LiNbO<sub>3</sub> single crystal rods and fibers grown by the laser heated pedestal growth method. When equilibrated with a Li-rich powder, containing a mixture of LiNbO<sub>3</sub> and Li<sub>2</sub>NbO<sub>4</sub>, crystals of stoichiometric composition can be obtained. This treatment was used to raise the phase-matching temperature of congruent LiNbO<sub>3</sub> for second harmonic generation of 1064 nm radiation from 4 to 238°C. The 238°C phase-matching temperature is above the annealing temperature for photorefractive damage. This property, along with the good optical homogeneity, should allow efficient conversion of cw laser sources. We also, for the first time, demonstrated the doubling of 954 nm radiation in a LiNbO<sub>3</sub> crystal. (Author abstract) 31 refs.

## Chemical Vapor Deposition

**073902 OPTICAL FIBRES TAILORED FOR SINGLE MODE PROPAGATION IN THE 600-850 NM WAVELENGTH RANGE.** Optical fibers exhibiting single mode transmission in the 600-850 nm wavelength range have been designed. Using MCVD method with inner pressure control and adopting an unusual procedure, optical fibers with cut-off wavelength at 575 nm have been obtained. The core was doped only with Ge, devoting particular attention to the index profile. The resulting fiber has a 4.2 µm core diameter, a numerical aperture of 0.102 and an optical window between 575-900 nm, in which the fiber is single mode. (Author abstract). 8 Refs.

**Coatings** See Also ELECTRIC LAMPS, ULTRAVIOLET—Energy Conservation.

**073903 LIQUID CRYSTAL POLYESTERS FOR OPTICAL FIBER JACKETING.** A new coating material with a thermal expansion coefficient ( $\alpha$ ) of approximately  $10^{-6}K^{-1}$  and a Young's modulus ( $E$ ) of approximately 10 GPa has been developed for optical fiber. The low  $\alpha$ , high  $E$  coating layer is obtained as a result of the molecular orientation of a thermotropic liquid-crystal polyester (LCP) during extrusion-coating of the fiber. The LCP material also has adequate flexibility because within one polymer chain the length of the rigid and/or flexible segments is optimized. The LCP-coated fiber exhibits a slight fiber-strain change of approximately  $10^{-4}K^{-1}$  and no excess loss in the temperature range of -60 to 80°C. (Author abstract) In Japanese. 10 refs.

**073904 POLYMER COATINGS FOR OPTICAL FIBERS.** Coating materials for optical fibers must be chosen with close attention to the manner in which their properties affect fiber performance. The ability to protect fiber strength and to provide resistance to excess transmission losses caused by microbending are the most important functions of the coating. Two basic considerations that govern fiber strength are the avoidance of damage to the glass surface during coating application and the quality of the applied coating. There are several factors related to the quality of the coating: coating concentricity, incomplete coatings, coating mechanical integrity, and particle contaminants in the coating. An examination is also made of microbending loss and its effect on fiber performance, microbending loss related to coating properties, and microbending in fiber cables. 28 refs.

## Components

**073905 CONVENIENT FIELD-INSTALLABLE ANTIREFLECTION COATING FOR OPTICAL FIBER CONNECTORS AND OTHER COMPONENTS.** Disc-shaped pellicles 15 microns thick are antireflection coated and cemented to the polished ends of optical fiber connectors. Excess loss due to increased fiber separation is a maximum of 10 percent (.46 dB), typically 3.8 percent (.16 dB) in graded index fibers; Fresnel back-reflections are reduced by a factor of more than 10. (Author abstract). 6 Refs.

## Computer Aided Analysis

**073906 MICROSCOPIC COMPUTER TOMOGRAPHY MEASUREMENT OF NONAXISYMMETRICALLY DISTRIBUTED OPTICAL FIBER REFRACTIVE INDEX.** A nonaxisymmetrically distributed method for measuring the refractive index of an optical

fiber is described. The light intensity distribution is observed with a microscope when an optical fiber is laterally illuminated by collimated light. The integrated refractive-index difference along the projective line is obtained by performing two integrations of the light intensity. The fiber is rotated, and the observation and calculations are repeated at each angle of rotation. The refractive-index pattern over the fiber cross section is reconstructed by computer tomography. 10 refs.

## Computer Aided Design

**073907 UN OUTIL DE CAD POUR FIBRES OPTIQUES MONOMODES. [A CAD Tool for Monomode Optical Fibers].** The applications of monomode optical fibers in telecommunication are increasing. The main characteristics of such fibers are determined by the refractive index distribution of its core fibers. This article describes a tool for the dimensioning of monomode fibers that is based on the numerical solution of vectorial wave function. (Translated author abstract) In French. 17 refs.

Kotrotsios, G. (CSEM, Neuchatel, Switz); Parriaux, O. *Bull Assoc Suisse Electr* v 78 n 15 Aug 8 1987 p 921-925.

## Connectors

**073908 ROBOT ASSEMBLES FIBER-OPTIC CONNECTORS.** When AT&T chose to automate its production of fiber-optic connectors, it turned to Com-Tal, a St. Paul company that specializes in flexible automation. An automated robotic workcell uses an Adept robot for a high speed, three-piece connector assembly. The end effector transports each connector body to a final assembly station where fiber optics and retroreflective sensors scan the assembly for proper alignment.

Anon. *Automation (Cleveland)* v 35 n 1 Jan 1988 p 56-57.

## Cooling

**073909 COOLING RATE IN FIBER DRAWING PROCESS GOVERNS THE STRENGTH OF THE 630 nm-ABSORPTION.** The effect of a forced or delayed fiber cooling on the Drawing Induced Absorption (DIA) at 630 nm in pure silica-core fibers is investigated. The cooling rate only, not the drawing tension as assumed generally before, determines the intensity of the DIA and explains the draw speed and fiber diameter dependence, too. (Author abstract) 7 refs.

## Defects

**073910 HYDROGEN INTERACTION IN HIGH GE-DOPE SILICA OPTICAL FIBRES.** Paramagnetic defects are observed in high Ge-doped silica fibres. Particularly the E'(Ge) centres and the drawing induced E'(Si) centres are tested with hydrogen at room temperature and at 100 °C. An E'(Si) centre bleaching occurs after hydrogen adsorption-desorption cycle at room temperature. A decrease in the E'(Ge) centre EPR signal during H<sub>2</sub> adsorption-desorption cycle at 100 °C is noted. At same time the increase of OH peaks and background loss in the attenuation curves is observed. (Author abstract) 4 Refs.

Cocito, G. (CSELT, Turin, Italy); Ferraris, M.; Modone, E.; Sordo, B. *CSELT Tech Rep* v 16 n 4 Jun 1988 p 405-407.

**073911 CONSOLIDATION-ATMOSPHERE INFLUENCE ON DRAWING-INDUCED DEFECTS IN PURE SILICA OPTICAL FIBERS.** Drawing-induced paramagnetic defects (E' centers and oxygen-associated hole centers (OHCs)) and optical absorption bands at 630 nm and in the UV region are investigated for optical fibers.

These fibers are drawn from pure silica glass preforms consolidated in atmospheres containing O<sub>2</sub> and Cl<sub>2</sub> of various contents. UV absorption bands at 245 nm and 275 nm are clearly observed through deconvolution of the absorption spectra of optical fibers. The defects and absorption bands are influenced by the atmosphere in the consolidation process: (1) the OHCs and the absorption bands at 630 nm and 275 nm increase the intensity with increasing O<sub>2</sub> content and with decreasing Cl<sub>2</sub> content; (2) the E' centers decrease under the same conditions; and (3) the absorption band at 245 nm is independent of the atmosphere. These results reveal that O<sub>2</sub> incorporated into the preforms plays a vital role in the formation of the drawing-induced defects and absorption bands. The analysis of the O<sub>2</sub> dependencies indicates that the defect formation is due to diffusion of O<sub>2</sub> in the drawing process. It is also suggested that Cl<sub>2</sub> suppresses the reaction with O<sub>2</sub> in silica glass. 29 refs.

Hibino, Yoshinori (NITT, Tokai, Jpn); Hanafusa, Hiroaki. *J Lightwave Technol* v 6 n 2 Feb 1988 p 172-178.

**073912 SUBTHRESHOLD FLAWS AND THEIR FAILURE PREDICTION IN LONG-DISTANCE OPTICAL FIBER CABLES.** A study of surface defects and static fatigue data is presented to support the view that subthreshold surface defects are responsible for failure in proof-tested optical fibers. For this type of defect, crack initiation, as opposed to crack growth, is the rate-limiting step. Classical crack propagation theory does not describe this process sufficiently well for lifetime prediction, but semiempirical techniques indicate that this popular treatment may be pessimistic. A more conventional reliability treatment, similar to that used for other system components, appears to offer the best available approach to the task of failure lifetime prediction in proof-tested fibers. 24 refs.

**Degradation** See Also TELECOMMUNICATION CABLES—Design.

**073913 ESTIMATION OF LONG-TERM TRANSMISSION LOSS INCREASE IN SILICA-BASED OPTICAL FIBERS UNDER HYDROGEN ATMOSPHERE.** The irreversible loss increase in silica-based optical fibers due to hydrogen is discussed on the basis of results of various high-temperature tests. The results show that germanium-doped-core fibers have different behavior with respect to irreversible loss increase, and that a pure-silica-core fiber fabricated under optimum conditions is very stable against irreversible loss increase. The estimation of long-term transmission loss stability is also discussed, and high-temperature testing is certified to be effective for estimating the long-term loss stability under low temperature. 20 refs.

**073915 PRACTICAL UPPER LIMITS TO CUTOFF WAVELENGTH FOR DIFFERENT SINGLE-MODE**

**FIBER DESIGNS.** A practical upper limit to cutoff wavelength in single-mode fiber is investigated. Based on the relationship between the attenuation of the LP<sub>11</sub> mode and the length dependence of cutoff wavelength, a formula is developed to predict this limit from four fiber designs commonly seen in commercially available fibers. It is found that, depending on fiber design, the upper limit of factory-measured fiber cutoff wavelength is anywhere from 20 to 60 nm above the system operating wavelength, even for a worst-case straight fiber layout. Under actual field layout conditions, however, the limits converge to approximately 65 nm above the system wavelength for all four fiber designs. The practical upper limit predicted here is confirmed through an experimental evaluation of modal noise effects in a 1.2-Gbit/s single-mode fiber system. 12 refs.

**Doping** See Also REFLECTOMETERS—Infrared.

**073916 FLUORINE DOPING IN MCVD OPTICAL FIBRES.** Fluorine incorporation in silica glass network has been already investigated using CCl<sub>2</sub>F<sub>2</sub> (Freon-12) as a source. Considerations on the stoichiometry of the reactions involved in CVD processes and experimental results on the refractive index are detailed. The data are collected in a ternary diagram that is proposed as a useful graphic representation in order to identify iso-index curves. A value of  $4.9 \times 10^{-3}$  for the refractive index difference has been obtained. This value has been achieved with a flow composition very far from usual CVD conditions. (Author abstract) 8 Refs.

## Environmental Testing

**073917 ENVIRONMENTAL EFFECTS ON THE STATIC FATIGUE OF SILICA OPTICAL FIBER.** The static fatigue properties of silica optical fiber are measured in 90°C aqueous environment for various pHs in the range 0 to 14 and for distilled water. The effect of a UV-curable urethane acrylate protective coating is evaluated by directly comparing coated and bare fiber. It is found that both higher pH and (at long times) the presence of the protective coating increase the fatigue rate. (Edited author abstract) 38 refs.

## Fabrication

**073919 HIGH-RATE FABRICATION OF OPTICAL FIBER PREFORMS BY THE MULTI-FLAME VAD METHOD.** A new type of burner with a multi-flame structure is proposed for high-rate fabrication of

optical fiber preforms by the vapor-phase axial deposition method (VAD). Fine glass particles synthesized using the double-flame burner under a variety of conditions are observed with a SEM and their deposition rates are measured. Then, this technique is applied to several types of preform fabrications. As a result, the deposition rate for one double-flame burner is increased by as much as 5 g/min. The multi-flame VAD method enables obtaining whole synthesis for single-mode optical fiber preforms at a high deposition rate of 10.2 g/min. (Author abstract) 17 refs. In Japanese.

**073920 HIGH FREQUENCY PLASMA DEPOSITION IN FABRICATION OF OPTICAL GUIDE FIBRES.** The aim of this work was to calculate the electromagnetic fields in the high-frequency induction discharge at atmospheric pressure on oxygen during deposition of layers of silica glass on a pipe 19 mm in diameter and 2.5 mm wall thickness, and develop a general method of calculating several parameters of the process of formation of SFL blanks with small losses (thickness of the deposited  $\text{SiO}_2$  shell, radius of the  $\text{SiO}_2 + \text{GeO}_2$  core, S/a parameter). The proposed method of calculations can be used for selecting pipes of various diameter and wall thickness in designing the process of formation of SFL blanks using the hf plasma at atmospheric pressure. 6 refs.

**073923 FIBERS WITH PURE  $\text{SiO}_2$ -CORE MADE BY PICVD.** Recent results of single- and multimode fibers with a pure or partially doped  $\text{SiO}_2$  core and a depressed cladding fabricated by the Plasma-Impulse-CVD (PICVD) process are presented. Fibers with good radiation resistance have been realized. Losses as low as 1.3 dB/km at 860 nm have been achieved. (Author abstract) 6 refs.

Bauch, H. (SCHOTT Glaswerke, Mainz, West Ger); Paquet, V. *J Opt Commun* v 8 n 4 Dec 1987 p 136-139.

**073924 POSSIBILITIES FOR MANUFACTURING OPTICAL FIBRES.** The process for manufacturing optical fibres for optical communication systems has been developed over the last few years into a reliable technique. Elaborate machines and sensitive operations for the

production of the preforms and drawing of the fibres themselves have been mastered. The future belongs to the monomode fibre, which with an optical wavelength of 1300  $\mu\text{m}$  can be used for lines with repeater spacings of over 30 km. (Edited author abstract) 2 refs.

Freidinger, Robert. *Wire World Int* v 29 n 5 Sep-Oct 1987 p 107-110.

**073925 OPTICAL FIBER FABRICATION BY THE OUT-DIFFUSION METHOD.** Single-mode optical fibers with triangular index profile are successfully fabricated by a new fabrication technique, the 'out-diffusion method'. Evaporation and diffusion of fluorine by heating and subsequent collapsing of the fluorine-doped silica glass tubes result in formation of the core in the center of the collapsed preforms. Optical fibers with refractive index difference of 0.67% are obtained with an optical loss of 0.40 dB/km at 1.57  $\mu\text{m}$  wavelength. (Author abstract) 7 refs.

**073926 INNER PRESSURE CONTROL METHOD IN OPTICAL FIBER PREFORM FABRICATION BY VAPOR-PHASE AXIAL DEPOSITION.** A method to control inner pressure variation in a vapor-phase axial-deposition (VAD) apparatus is developed. It uses a flame-detection technology to explain temperature fluctuations. Primary causes of the inner pressure fluctuations are analyzed, and suppression techniques are described. They include the adoption of a large buffer-tank and bias gas addition. An inner pressure-feedback control mechanism operates by adjusting the bias gas flow, keeping fluctuations of the inner pressure to less than half of that with no control. 6 refs.

## Failure

**073927 FIBRE OPTIC DAMAGE DETECTION IN COMPOSITE STRUCTURES.** A system of thin, light-conducting fibres, integrated into a composite structure during its manufacturing process, can serve as a reliable, automatic and remote working long-term monitoring device for structural damage. Fractures, cracks, or delaminations in a structure area can destroy the optical fibres installed there and thus interrupt the light flow. Various examples of applications in GFRP aircraft components are described. The outline of a complete fibre optic nervous system (FONS) for large Airbus CFRP components shows how fibre optic damage detection can contribute to future aircraft maintenance and inspection philosophies. (Edited author abstract) 8 refs.

Hofer, B. (Messerschmitt-Boelkow-Blohm GmbH, West Ger). *Composites* v 18 n 4 Sep 1987 p 309-316.

**073928 FAILURE OF OPTICAL FIBRES EMBEDDED IN COMPOSITE MATERIALS.** This paper shows the use of an available 'fiber in matrix' model to represent optical fiber embedded in a composite three-point bend specimen. The model was used to predict the optical fiber stress level while embedded in the loaded structure, and experimental failure of such embedded fiber was compared with the failure stress of similarly treated non-embedded fiber. Indications are that knowledge of optical fiber strength combined with use of the model will permit prediction of embedded optical fiber failure. (Author abstract). 18 Refs.

Waite, S.R. (City Univ, London, Engl); Sage, G.N. *Composites* v 19 n 4 Jul 1988 p 288-294.

## Fatigue

**073929 STATIC FATIGUE OF OPTICAL FIBERS IN BENDING.** A two-point bending technique for making static fatigue measurements on optical fibers is described which allows large quantities of data to be rapidly and conveniently gathered. Statistical analysis is

used to compare the times to failure of the method with those of the commonly used mandrel and tensile methods. Direct experimental comparison of the two-point bend and tensile method shows that while the times to failure are generally longer for two-point bend than tension, the essential fatigue behavior is identical for the two methods. (Author abstract) 13 refs.

Matthewson, M. John (AT&T Bell Lab, Murray Hill, NJ, USA); Kurkjian, Charles R. *J Am Ceram Soc* v 70 n 9 Sep 1987 p 662-668.

## Focusing

**073930 OBSERVATION OF CATASTROPHIC SELF-PROPELLED SELF-FOCUSING IN OPTICAL FIBRES.** Observation of what appears to be a new guided-wave phenomenon which causes optical damage to the entire optical fiber transmission path at relatively low optical power levels is reported. Damage to the core manifests itself as periodic restructuring of the region, similar to that seen in self-focusing. (Author abstract) 11 refs.

Kashyap, R. (British Telecom Research Lab, Ipswich, Engl); Blow, K.J. *Electron Lett* v 24 n 1 Jan 7 1988 p 47-49.

## Fracture See Also OPTICAL COMMUNICATION.

**073931 CLEAVAGE OF OPTICAL FIBRES FOLLOWING DIAMOND-WEDGE INDENTATION.** A major problem in the fiber-optics and communications area is the coupling of two fiber ends with the minimum of transmission loss across the interface. The fiber end faces need to be flat, smooth and at right angles to the fiber axes. A method of achieving this is described. It involves first adding a short precursor crack to the fiber by indentation with a diamond wedge under carefully controlled conditions and then pulling the fiber along its axis until it fractures. The angle of the diamond wedge is important if it is to produce a good precursor crack and be capable of repeated use without suffering damage. Experiments are described which optimize the diamond wedge angle and the loads. A model is developed relating the length of the precursor crack formed by wedge indentation and the applied load and wedge angle. (Edited author abstract) 33 refs.

## Impurities

**073932 BEHAVIOR OF ALKALI IMPURITIES AND THEIR ADVERSE EFFECT ON GERMANIA-DOPED SILICA FIBERS.** Alkalis, such as sodium and potassium, were found to migrate from over-jacketing natural silica tubes into germania-doped cores forming defects leading to hydrogen-induced loss in the infrared wavelength region. These impurities were found to be removed from the same kind of natural silica tubes during the MCVD process. Results strongly point out that the absence of impurities is essential for 1.55- $\mu\text{m}$  transmission systems based on germania-doped silica fiber. 8 refs.

**073936 RECENT ADVANCES IN FIBER DRAWING AND COATING TECHNOLOGY.** The large predicted increase in demand for a lightwave communication system is now being realized, and in response to this manufacturing technologies of high quality optical fibers have advanced rapidly in the past ten years. This paper reviews the evolution of the fiber drawing and coating processes, discussing the various sources and coating materials which can be used. Subsequently, the latest results obtained from the very high speed coating technique (draw speed greater than 10 m/sec) are presented. (Edited author abstract) 13 refs.

Paek, U.C. (AT&T, Princeton, NJ, USA). *AIChE Symp Ser* v 83 n 258 1987, Fiber Opt Eng: Process and Appl (Pap from Natl AIChE Meet Held 1984-1986) p 38-41.

**073937 OPTICAL FIBRE MANUFACTURE IN AUSTRALIA.** The Melbourne-Sydney optical fiber cable project was the instigator for the 'all-Australian' optical fiber cable. Cable with Australian-made fiber became a reality when two optical fiber manufacturing plants, became operational in 1986. Mass production of silica-based optical fibers by vapor deposition methods have dominated the fiber manufacturing industry over the past decade. Several techniques have emerged which are widely used throughout the world, namely the modified chemical vapor deposition (MCVD), the vapor-phase axial deposition (VAD), the outside vapor deposition (OVD), and the plasma activated chemical vapor deposition (PCVD) processes. The authors describe two of these methods - the VAD and OVD. (Edited author abstract) 11 refs.

**073938 DIGITAL HAND-HELD TENSIO METER - A QUALITY IMPROVEMENT.** Manufacturing fiber optic cable is a delicate and precise process operation. Siecor Corp., a manufacturer of fiber optic cable and

related equipment, has a philosophy of 'Total Quality'. In order to meet this philosophy, key process parameters are monitored and controlled to produce a quality product. Several processes in the manufacturing of fiber optic cable require measuring fiber tensions. The article describes a tensiometer for this purpose.

Daily, Michael A. *Wire J Int* v 20 n 10 Oct 1987 p 31-34, 36, 39-41.

**073939 MANUFACTURING PROCESSES FOR FLUOROZIRCONATE GLASS PREFORMS AND OPTICAL FIBERS.** Fluoride glasses, in the system composed by  $ZrF_4$ - $BaF_2$ - $LaF_3$ - $AlF_3$ - $NaF$ , are investigated as potential low loss materials for optical fibers, operating in the wavelength range of 2-5  $\mu$ m. The minimum loss of these glasses is predicted to be less than 0.01 db/km based on the precise evaluation for intrinsic loss factors. At present, among several optical fibers manufacturing techniques, the 'Rotational casting' method seems to be the most suitable for preform preparation and it has been developed in CSELT. The paper describes all the phases of this method, and the conditions adopted to obtain preforms for optical fibers. Several preforms were manufactured and some of their physical characteristics were investigated. Moreover the techniques developed, all over the world, for making optical fibers operating in the middle infrared region and comparison among them, are also discussed. (Author abstract) 15 refs.

**073940 FLUORINE-DOPING MECHANISM BY VAD METHOD.** A fluorine doping mechanism for fine glass particles is investigated. Fluorine doping and dissipating properties of fine glass particles are measured during heat-treating experiments. Fluorine doping and dissipating amounts are dependent on particle-size,  $SF_6$  partial pressure and temperature. The experimental results are interpreted and a possible fluorine-doping model for fine glass particles is presented. (Author abstract). 13 Refs. In Japanese.

**073941 DESIGN AND IMPLEMENTATION OF AN INDUSTRIAL-PROCESS ADAPTIVE CONTROL SYSTEM.** To satisfy the requirements of optical communication, it is necessary to control the factors affecting fiber performance. Considering these factors, the authors have developed a high speed Optical Fiber Drawing Process Microcomputer Adaptive Control System (OFDPMACS). The design and implementation with a dual-microcomputer of OFDPMACS is discussed. Aimed at the requirements of high precision and high speed on the drawing of optical fiber, the authors propose a new self-tuning control algorithm based on output prediction. The fiber diameter can be controlled within the range of 125 + 0.5  $\mu$ m with such an algorithm. (Edited author abstract). 6 Refs. In Chinese.

## Marine Applications

**073943 UPON EMPLOYING FIBER OPTICS AT SEA.** While optical fibers are rapidly finding great acceptance on land every day, they are only recently beginning to be used in marine applications. Like on land, they offer certain advantages over electrical methods of transmission, such as small size and larger bandwidth. Optical fiber systems are, however, not a total replacement for electrical systems since they carry information rather than power, which still needs to be transmitted over wires. But when the power level is low enough, energy can be transmitted in the form of light to be transformed at destination into electricity.

**073945 NEW PLASTIC OPTICAL FIBER USING POLYCARBONATE CORE AND FLUORESCENCE-DOPED FIBER FOR HIGH TEMPERATURE USE.** This article describes the development of a plastic optical fiber composed of a polycarbonate core with a glass transition temperature of 150°C, and a cladding of newly developed poly-4-methyl penten-1, which softens at 173°C. This cladding is suitable for use at temperatures up to 130°C. The minimum optical attenuation is 0.8 dB/m at 765 nm in the near-infrared region. The cause of the attenuation of the PC-core fiber was analyzed and the intrinsic loss limit was estimated to be 0.4 dB/m at 765 nm. The fiber has excellent characteristics, including thermal stability up to 125°C, high flexibility, high strength, and self-extinguishing properties. The polycarbonate core fiber, of doped organic fluorescing materials, has also been developed for automotive uses such as light guide and illuminator. (Edited author abstract) 12 refs.

**073946 LOW-LOSS FLUORIDE OPTICAL FIBERS FOR MIDLINFRARED OPTICAL COMMUNICATION.** Optical loss in current fibers is dominated by two major extrinsic loss factors, defect scatterers and impurities. Scatter analysis using a Raman microprobe has revealed that the majority of them are  $ZrO_2$  crystallites. These crystallites dominate the fiber scattering characteristics, having both wavelength independent and Rayleigh wavelength<sup>4</sup> dependencies according to their size. Excess loss due to OH groups which causes absorption at around 2.9  $\mu$ m is quantified as 2000-5000 dB/km/ppm, depending on glass composition. These results suggest that further efforts in glass synthesis should concentrate on eliminating oxide and hydroxide impurities, and on the further purification of the raw materials. The key for realizing high-quality, low-loss, and long-length fluoride fibers is currently related to whether or not oxide scatterers can be completely eliminated. 38 refs.

**073947 MECHANICAL AND OPTICAL PROPERTIES OF THE CHALCOGENIDE GLASS SYSTEM  $As_2Se_{3-x}Te_x$ .** Chalcogenide glasses of  $As_2Se_{3-x}Te_x$  ( $0 \leq x \leq 3$ ) were fabricated with special care to avoid traces of oxygen, using very pure raw materials. From part of these materials, special plates were made, and fibers were pulled from the rest. From transmittance measurements, the existence of absorption bands was shown, corresponding to the presence of small crystallites of  $As_2O_3$ . The attenuation in the infrared of these plates increased from 14 dB/m for  $As_2Se_3$  to 29 dB/m for  $As_2Se_{0.5}Te_{2.5}$ . Conversely, a decrease of microhardness  $V_H$  was observed. The attenuation of  $CO_2$  laser light ( $\lambda = 10.6 \mu m$ ) transmitted through the pulled fibers was measured as a function of the  $Te(x)$  content, and an increase of the attenuation was observed from 18.1 dB/m for  $As_2Se_3$  to 66.7 dB/m for  $As_2Se_{1.5}Te_{1.5}$ . 22 refs.

**073949 CALCULATIONS TO DETERMINE THE EFFECTIVE CUTOFF-WAVELENGTH OF SINGLE-MODE FIBERS.** The effective cutoff of circularly symmetric weakly guiding single-mode fibers is calculated from the spectral attenuation of the  $LP_{11}$ -mode, which we assume to be caused by frustrated total reflection. We use a semiclassical model which is applicable to inhomogeneous fiber profiles also. A comparison with the results of the leaky-mode-approach for step-index-fibers shows that the approximations made in our model are tolerable. We then present a new criterion for a 'mathematical' cutoff. It is defined for inhomogeneous fiber claddings as well, where the mathematical cutoff criterion fails. In contrast to the mathematical cutoff, our criterion takes into account fiber length and provides a quickly computed estimation of the effective cutoff if measured at fiber pieces of some meters in length. (Edited author abstract) 4 refs.

**073951 SOLUTIONS OF NONAXISYMMETRIC FIELDS IN SELFOC FIBERS WITH LONGITUDINAL IMPERFECTIONS.** The refractive index is assumed to be of the form  $K = \epsilon/\epsilon_0 - K_2(z)r^2$  ( $K_2(z)$  is a gradually varying function of  $z$ ). The analytic solution is obtained. When  $K_2$  is a constant, the solution is reduced to that of perfect SELFOC fibers, which is well known. The solution of the imperfect fiber is expanded in terms of that of perfect fibers so that the mode conversion in imperfect fiber is obtained. 7 refs.

Kang, Shouwan (Northern Jiaotong Univ, Beijing, China). *J Lightwave Technol* v LT-5 n 12 p 1690-1694.

**073952 MULTIMODE CONCATENATION MODAL GROUP ANALYSIS.** A multimode concatenation model is derived using the link-mode power distribution and fiber-mode group delay times. The model is used deterministically to predict the bandwidth length exponent  $\gamma$  for seven concatenations.  $\gamma$  depends directly on the amount of correlation existing among the fibers' mode group delays. Under the assumption that the fiber ensemble is stationary and satisfies ergodicity conditions, it is possible to evaluate an ensemble- $\gamma$ . It can be used statistically to estimate the concatenation- $\gamma$ . 12 refs.

**073953 WAVELENGTH DEMULTIPLEXING USING BENDS IN A SINGLE-MODE OPTICAL FIBER.** A method of wavelength demultiplexing is developed that makes use of the wavelength and bend-radius dependence of the pure bend loss at single radius bends in a single-mode fiber. The light leaving the fiber at a bend forms one output of the demultiplexer. Equations are derived that predict the bend radii for the most-efficient operation of the demultiplexer and the power extracted from the fiber at each wavelength. The demultiplexer operates over the wavelength range corresponding to  $V$  numbers from 2.4 to 1.6. A two-wavelength demultiplexer formed from  $90^\circ$  bends is constructed and tested. Collection efficiencies of 70% and insertion losses of less than 2 dB are shown to be possible. Crosstalk isolation in excess of 40 dB can be achieved with the aid of optical wavelength filters. The performance of a three-wavelength demultiplexer is also considered. 10 refs.

**073954 PHASE INDUCED INTENSITY NOISE IN CONCATENATED FIBER-OPTIC DELAY LINES.** A fiber-optic differential-delay-line structure converts the phase noise of its short coherence source to intensity noise at its output. If this structure is followed by a similar system, intensity noise is generated as well as filtered by each of the two systems. The power spectrum of the noise at the output of concatenated systems built of Mach-Zehnder and the recirculating delay lines is theoretically studied. The spectral structure of phase-induced intensity noise at the output of these concatenated systems is analyzed, taking into account polarization effects and emphasizing the physical interpretations of the results. An experimental verification is presented for the case of two recirculating delay lines in series. 19 refs.

**073955 BUTTERFLY MODEL OF SINGLE-POLARIZATION FIBERS.** An exact analysis of propagation along practical single-mode single-polarization fibers is difficult and involves extensive numerical analysis. The authors present a simple refractive-index profile - the butterfly profile - which exhibits the key features of single-polarization operation, but possesses exact analytical solutions of the scalar wave equation for its modes, enabling such quantities as fundamental-mode cutoff and birefringence to be readily evaluated. The accuracy of perturbation solutions based on axisymmetric profiles can also be determined. By incorporating stress anisotropy, the relative values of cutoff for the two polarizations of each mode are shown to be in quantitative agreement with

measured values for the bow-tie fiber. 18 refs.

**073956 BIREFRINGENCE IN BENT SINGLE-MODE FIBERS.** Changes to field properties when an optical fiber is bent are considered. A formula is obtained for the geometrical birefringence in a single-mode fiber due to bending, and is explicitly evaluated for a Gaussian field approximation, giving a simple analytic expression; it is also evaluated for more exact fields. Scalar theory is not sufficient to describe this birefringence, as reported previously, and vector or polarization corrections must be included in the theory. This birefringence is several orders of magnitude less than stress-induced bending birefringence. 15 refs.

**073958 INTERFERENCYJNE POMIARY DYS-PERSJI SWIATLA WE WLOKNACH OPTYCZNYCH.** [Interferometric Measurements of Optical Fibre Spectral Dispersion]. The author studied the behavior of spectral dispersion of cladged, 'step-index' type optical fibers: thin-core type 2wBc, thick-core 2wBg, high-aperture 2wLS and 'gradient-index' type, four-layer 4wHB fibers. Refractive indices of every layer was found by transversal interferometry method with 'shearing' type interferometer. The influence of various dispersions of immersion environment and fiber material on measurements of difference in optical paths was also studied in interferometric fringe field. The results thus obtained were compared with dispersion curves of glasses used in technology of the said fibers. (Author abstract) In Polish. 17 refs.

**073959 MODULATION FREQUENCY-SHIFT TECHNIQUE FOR DISPERSION MEASUREMENTS IN OPTICAL FIBRES USING LEDS.** Reliable phase-shift measurements in optical fibers were performed by downshifting the modulation frequency of the optical signal to the low-frequency range before detection. This technique maintains the full resolution of the high-frequency modulation and increases the sensitivity allowing accurate group delay measurements in single-mode fibers over a 300 nm spectral range using a single LED. **073960 LIGHT POWER FLUCTUATIONS AT THE OUTPUT END OF A FIBER IN PARTIAL COUPLING WITH A DETECTOR IN COHERENT LIGHT.** Fluctuations of intensity located in the intersection of the end-face image of a graded-index fiber and a circular diaphragm are studied in coherent light. The

curve of the signal to noise ratio against the misalignment  $\delta$  shows a discontinuity when the fiber is motionless. To explain this phenomenon, this intensity is calculated by proposing a Gaussian representation of the end-face intensity. (Edited author abstract) 11 refs.

**073961 CORE DOPANT PROFILES IN WEAKLY FUSED SINGLE-MODE FIBRES.** Core dopant profiles have been measured in weakly fused single-mode fibres. The results show that the peak refractive index of the core decreases and the core size increases during fusing, contrary to previously proposed models. This suggests that the field is still guided by the cores and that the coupling mechanism model should include the effects of the cores for weakly fused fibres. (Author abstract) 3 refs.

**073963 GAUGE FOR MEASURING THE GEOMETRIC CHARACTERISTICS OF FIBERS BASED ON A SEMICONDUCTOR EMISSION SOURCE.** An important OF characteristic is its diameter, on whose constancy the spatial resolution of the fiber braids and faceplate with regular stacking depends. The deviation from the given OF diameter should not exceed 0.8-2%. Consequently, the development of a highly accurate compact apparatus to measure OF diameters during its drawing is a very urgent problem. The OF (Optical Fibers) diameter was estimated by the comparison method, i.e., by determining the distance between the minima of the diffraction patterns from the fiber being checked and an orthogonally located —standard— fiber. The resultant cruciform diffraction pattern, recorded on the screen of the television installation, carries information about the deviation of the diameter being checked relative to the —standard.— Utilization of a semiconductor laser as radiation source in a measuring installation permits a significant reduction in the overall dimensions and supply voltage while maintaining high stability and low response to vibrations and external illumination. 5 refs.

**073965 CALCULATION AND MEASUREMENT OF MODE TRANSITION MATRICES FOR DIFFERENTIAL MODE ATTENUATION AND DIFFERENTIAL MODE DELAY CHARACTERIZATION OF OPTICAL FIBERS.** A method is described to characterize multimode fiber-optic devices in terms of differential mode attenuation (DMA), differential mode delay (DMD), and mode coupling. It is important to describe these properties with only a few data. This is accomplished

by the mode transition matrix method, in which each fiber optic component is characterized by one or more  $3 \times 3$  matrices. Certain trade-offs between simplicity and precision are unavoidable, but it has already been demonstrated that the matrix method yields results that are precise enough to calculate system responses poorly. Mode or pulse transition matrices are defined for the DMD characterization of fibers. Measurements have been carried out. (Edited author abstract) 17 refs.

**073966 LAUNCHING AND RECEIVING CONDITIONS FOR OPTICAL FIBER LOSS MEASUREMENTS USING AN OTDR.** Optical pulse measuring instruments (OTDRs) are very useful in locating broken areas and assessing the homogeneity of optical fibers. This study investigates the backscattering mode distribution of graded-index optical fibers using geometrical optics. The launching condition of the light pulse and the receiving condition of backscattering, and their relation to the measured optical and splicing losses, are determined. The theoretical and experimental relation between the measured values of backscattering by OTDR and cut-back methods is also discussed. It is shown that the steady-state condition of the received backscattering light is necessary when measuring the losses of steady-state mode distribution by the OTDR method. We propose the possibility of estimating the splicing loss values of the cut-back method from the difference of the splicing loss measurements under varied launching conditions of OTDR method. The correctness of this method is confirmed experimentally. (Edited author abstract) 16 refs.

**073969 RESOLUTION MODEL FOR MEASUREMENT OF OPTICAL FIBRE PREFORMS BY FOCUSED LASER TRANSVERSE ILLUMINATION TECHNIQUE.** A model has been developed to describe the spatial resolution function of a focussed laser transverse illumination technique for the measurement of the refractive index profile of an optical fibre preform. The resolution function is shown to have similar Gaussian characteristics to that of the sampling beam at the centre plane of the preform, and this has been tested by measurements made on different preforms and with different beam diameters. The results show that the model predicts both the quantitative and qualitative behaviour of the resolution function correctly, which enables the comparison of the resolutions of different preform profil-

ing techniques, as well as assisting in the study of measurement anomalies. (Author abstract) 9 refs.

**073971 EXPERIENCE WITH MODE-FIELD RADIUS MEASUREMENTS.** The transverse offsets, and variable-aperture far-field methods have been applied to the measurements of the mode-field radii of two types of single mode optical fibre. Comparison with the results of calculations based on the measured refractive index profiles shows that discrepancies between the experimental results by the two methods may be confidently attributed to the deviation of the electromagnetic field in the fibre from a Gaussian form. A possible alternative test method for measuring the numerical aperture of a parabolic-index multimode fibre is described. The paper includes a number of comments on the technical problems associated with the measurement methods. (Author abstract) 10 refs.

**073972 MEASUREMENT OF CHROMATIC DISPERSION IN INSTALLED SINGLE-MODE FIBRE.** The measurement of chromatic dispersion in single-mode fibres using a 1300 nm edge-emitting LED, a 1550 nm laser diode, and the phase shift method are described. The approach is insensitive to fibre temperature change throughout the measurement, and may enable dispersion in single-mode fibre optimised for 1300 nm operation to be characterised in the 1550 nm region, as well as in the 1300 nm region. The influence of the edge-emitting LED on the measurement is also considered, in that error can arise through selecting narrow wavelength regions of its output, and matching its wavelength coverage to the fibre zero dispersion region is important for long length characterisation. Measurements on installed SM fibres are discussed. (Author abstract) 11 refs.

**073974 1.55  $\mu$ m WAVELENGTH REGION HIGH-STABILITY OPTICAL FIBRE LOSS VARIATION MEASUREMENT USING FIBRE COUPLER.** In the development of an optical fibre submarine cable, high measurement accuracy is necessary to extrapolate the loss variation of a long optical fibre from the loss variation of a short fibre under testing in various environmental

conditions, such as tensile force, hydraulic pressure and ambient temperature variations. To evaluate a small loss variation in a short-length optical fibre cable of the order of 100-200 m<sup>2</sup> a measurement accuracy of 0.001 dB is necessary. A 1.55  $\mu$ m-wavelength high-stability optical fibre loss variation measurement system, using a comparison method with an optical fibre coupler, was developed. Long-term stability within  $\pm 0.001$  dB over a 120 hour period at a room temperature variation of  $\pm 2.2^\circ\text{C}$  has been achieved. (Edited author abstract). 5 Refs.

**073975 DIRECT OBSERVATION OF OPTICAL WAVE BREAKING OF PICOSECOND PULSES IN NONLINEAR SINGLE-MODE OPTICAL FIBRES.** The combined use of a streak camera attached to a spectrograph allows the direct measurement of induced frequency modulation experienced by picosecond pulses during propagation through a single-mode fibre. Complete information is available in a single-shot event. As a result, optical wave breaking was observed. (Author abstract). 10 Refs.

Hamaide, J.P. (Univ Libre de Bruxelles, Brussels, Belg); Emplit, P. *Electron Lett* v 24 n 13 Jun 23 1988 p 818-819.

**073976 FIBER BIREFRINGENCE MEASUREMENTS WITH AN EXTERNAL STRESS METHOD AND HETERODYNE POLARIZATION DETECTION.** Precise birefringence measurements on polarization-maintaining fibers have been obtained with external pressure scanning along a fiber axis. Output detection has been performed through heterodyne interferometric polarimetry, which allows the use of a simplified technique (avoiding pressure modulation and fiber eigenaxis search). Beat-length evaluation is achieved directly through multiple counting of periodical variations of the two radio-frequency output signals provided by the polarimeter. A theoretical model for the behavior of the fiber output polarization on the Poincare sphere as a function of pressure scanning has been developed and experimentally tested and the results are in good agreement with the theory. 11 refs.

**073979 SUITABLE DEFINITION OF MODE FIELD DIAMETER IN VIEW OF SPLICE LOSS EVALUATION.** The definition of the mode field diameter

is investigated theoretically and experimentally from the practical viewpoint of the splice loss estimation. The difference of mode field diameter defined by various definitions becomes larger as the V number decreases. This tendency agrees with the experimental result. As a result, the definition of mode field diameter obtained from the rms width of far-field intensity is found to be useful. 7 refs.

**073980 DISPERSION STATISTICS IN CONCATENATED SINGLE-MODE FIBERS.** Dispersion measurement data from two sets of fiber cable lengths were employed to determine the histograms of slope and wavelength of zero chromatic dispersion in concatenated single-mode fibers. A Monte Carlo technique was used under two concatenating scenarios, depending whether those fibers being concatenated are or are not manufactured by the same process. Results show that the variances of slope and wavelength of zero dispersion are inversely proportional to the number N of fiber cable lengths being concatenated. The average and standard deviation of zero-chromatic dispersion wavelength change less than 0.005% or 1%, respectively, when the actual dispersion slopes of individual fiber lengths being concatenated are replaced by random quantities distributed with uniformity within 0.08-0.1 ps/km-nm<sup>2</sup>. 22 refs.

**073981 COLLOQUIUM ON OPTICAL FIBRE MEASUREMENTS.** This colloquium proceedings contains 14 papers, of which one appears in abstract form only. The papers are concerned with the measurement of various optical properties of optical fibers. Specific topics included are single mode optical fibers; refractive index profiles; optical fiber chromatic and inter modal dispersion; Fourier Transform Spectroscopy; rare-earth-doped optical fibers; Equivalent Step Index; Variable Aperture Far Field method; mode field determination; Equivalent Tube Index; non reciprocity; Effective Mode Indices; and Second harmonic generation in a second order susceptibility grating written into an optical fiber. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11368 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

## Mechanical Properties

**073982 FIBRE OPTICS IN DYNAMIC STRAIN CABLES.** This article examines the development of a load carrying electro-optic cable assembly typically used for naval towed applications. As a full scale research and development exercise, different arrangements and positions of fiber optics were incorporated into the design to allow the evaluation of manufacturing parameters in order to determine suitability for long term operational use. Coupled with the design and manufacturing program was a series of land based and sea trials which have proven that an adequately ruggedized fiber optic element, if correctly positioned within the structure, is capable of withstanding all the rigors of operational service.

**073984 OPTIMUM FIBRE PARAMETERS OF LOW-LOSS SINGLE-MODE OPTICAL FIBRES FOR USE IN 1.55  $\mu$ m-WAVELENGTH REGION.** Design considerations are discussed for the structural optimization of 1.3  $\mu$ m zero-dispersion single-mode fibers for use in the 1.55  $\mu$ m-wavelength region. The ranges of optimum fiber parameters for mode field diam 2W and effective cutoff wavelength  $\lambda_{cc}$  are determined as  $2W = 10.5 \pm 1.0 \mu\text{m}$  and  $1.35 \mu\text{m} \leq \lambda_{cc} \leq 1.60 \mu\text{m}$ , respectively. A mean test fiber loss of 0.185 dB/km has been achieved. (Author abstract) 7 refs.

**073988 NONLINEAR POLARIZATION CHANGES IN A BIREFRINGENT FIBER.** The nonlinear evolution of the polarization state along a birefringent fiber has been numerically investigated using the Poincare sphere representation. The polarization changes of intense light in a birefringent fiber are governed by a competition between intrinsic and intensity-induced bire-

fringe. When the intrinsic birefringence is cancelled by the intensity-induced birefringence, the evolution of the polarization state along the fiber is sensitive to a small perturbation, i.e., a fluctuation of the birefringence. The trajectories of the polarization state exhibit a complex behavior. (Author abstract) 16 refs.

**073990 PROPERTIES OF PICVD-FIBERS WITH PURE  $\text{SiO}_2$ -CORE: THE INFLUENCE OF THE PREFORM COLLAPSE PROCESS.** Collapsing of preforms with low OH-content and pure  $\text{SiO}_2$  core oxygen rich atmosphere generates characteristic losses after fiber drawing. The losses consist of additional attenuation at 630 nm and 850 nm and an additional wavelength independent attenuation correlated to the value of both other attenuations. Using an appropriate collapsing technique allows for the preparation of low-loss fibers with pure  $\text{SiO}_2$  core. (Author abstract) 4 refs.

**073992 REFLECTIONS FROM POLISHED SINGLE MODE FIBER ENDS.** When the end of a single mode fiber is polished and placed in an index-matching liquid, a reflection will occur. Its amplitude depends on two factors: (1) the difference between the liquid's refractive index and that of the fiber, and (2) the polishing procedure used. By proper choice of both, the end-reflection can be reduced to below -60 db. When two well-polished fiber ends are joined together with a small, liquid-filled gap between them, the resulting reflection will be coherent addition of the two individual end-reflections. By adjusting the gap, this reflection can be made greater than or less than the individual end-reflections. (Author abstract) 10 refs.

**073993 CHARACTERISTICS OF PURE SILICA CORE SINGLE-MODE FIBER.** There are two types of the  $\text{SiO}_2$  core single-mode fiber. Type I fiber is fabricated by MCVD process and has a silica jacket in its outer cladding layer. Type II fiber is fabricated by VAD process. This fiber has a pure silica core and a cladding layer which consists of silica with fluorine uniformly added throughout the entire cladding region, achieves a 'matched cladding structure,' and has nearly the same fiber structural parameters as the conventional  $\text{GeO}_2$ - $\text{SiO}_2$  core fibers. This fiber is designed for use in both 1.3  $\mu\text{m}$  and

1.55  $\mu\text{m}$  wavelength. Some characteristics of practical use of the Type II fiber which we have developed are reviewed. 12 refs.

**073996 WAVELENGTH DEPENDENCE OF BRILLOUIN-GAIN SPECTRA FOR SINGLE-MODE OPTICAL FIBRES.** Brillouin-gain profiles are measured for fused-silica core and  $\text{GeO}_2$ -doped core fibres at wavelengths of 1286 nm and 1550 nm. The intrinsic Brillouin linewidth is found to vary as the square of optical frequency, as predicted for bulk fused-silica. However, the experimentally evaluated Brillouin line-widths at both wavelengths are broader by a factor of 2.5 than those predicted for the bulk glass. (Author abstract) 9 refs.

**074001 SINGLE-MODE FIBRES WITH EXTREMELY HIGH- $\Delta$  AND SMALL-DIMENSION PURE  $\text{GeO}_2$  CORE FOR EFFICIENT NONLINEAR OPTICAL APPLICATION.** Single-mode fibres with 8.2 percent  $\Delta$  and a 1.4 minimum diameter- $\text{GeO}_2$  core have been prepared for efficient stimulated Raman effect. When pumping a 2.7 m-long fibre by a Q-switched and mode-locked Nd:YAG laser ( $\lambda = 1.064 \mu\text{m}$ ), the first Stokes light ( $\lambda = 1.114 \mu\text{m}$ ) and second Stokes light ( $\lambda = 1.169 \mu\text{m}$ ) have been observed at the input peak power levels of 24 W and 40 W, respectively. These results indicate that the above critical power levels are approximately  $10^{-2}$  to  $10^{-3}$  smaller than those for the high-silica single-mode fibre. (Author abstract). 5 refs.

**074006 LONG-LENGTH LOW-LOSS POLARIZATION-MAINTAINING FIBERS.** Long-length low-loss polarization-maintaining fibers are useful for coherent optical transmission systems, active transmission lines with optical nonlinear effects, and other long-length optical transmission systems, such as those for bidirectional optical transmission. Design, fabrication, and characteristics of highly birefringent polarization-maintaining fibers with long length and low loss, especially polarization-maintaining and absorption-reducing (PANDA) fibers, are reviewed and discussed. Application of the fibers is also discussed. 28 refs.

Sasaki, Yutaka (NTT, Tokai, Jpn). *J Lightwave Technol* v LT-5 n 9 Sep 1987, Opt Fiber Conf/Sixth Biannual Int Conf on Integr Opt and Opt Fiber Commun, Reno, NV, USA, Jan 19-22 1987 p 1139-1146.

**074007 SINGLE-MODE FIBER COMPONENTS.** A review is presented of a variety of optical components made directly from single-mode fibers. The review first treats both ordinary and polarization-preserving fibers. The discussion of components is divided into passive and active components. Passive components include polarizers and directional couplers, as well as a discussion of splicing of polarization-preserving fibers. Active components require some external control or optical power. These components include polarization transformers, modulators, and optical amplifiers. It is noted that these components can be combined to construct inline all-fiber systems such as fiber gyroscopes, fiber Raman lasers, local area networks, or coherent lightwave systems. 122 refs.

Stolen, Roger H. (AT&T Bell Lab, Holmdel, NJ, USA); De Paula, Ramon P. *Proc IEEE* v 75 n 11 p 1498-1511.

**074008 COUPLED MODES OF ANISOTROPIC POLARIZATION MAINTAINING FIBERS.** Wave coupling between the fundamental vector modal fields of two identical, polarization-maintaining, weakly guiding fibers is analyzed. An improved coupled-mode theory is used that also applies to anisotropic materials. Coupling coefficients that are the elements of a coupling matrix are calculated and presented as functions of the relative tilt angle between the two fiber principal axes. Exact analytical expressions for the eigenvalues and their associated eigenvectors are given in terms of the elements of this coupling matrix, for any relative tilt angle. Symmetry relations that are found between elements of the coupling matrix much simplify the presentation of the eigenvectors. A weak-coupling approximation of the eigenvector expressions, which is also given, retains their qualitative properties. 9 refs.

Shafir, Ehud (Soreq Nuclear Research Cent, Yavne, Isr); Hardy, Amos; Tur, Moshe. *J Lightwave Technol* v 6 n 1 Jan 1988 p 58-63.

**074009 RADIATION RESISTIVITY IN SILICA OPTICAL FIBERS.** Hydrogen treatment of optical fiber waveguides with pure silica cores and boron, fluorine codoped silica claddings was found to effectively reduce the  $\gamma$ -ray induced loss increases in visible wavelength region. Germanium-doped core fibers free from metal impurities had good resistance against  $\gamma$ -rays. The induced losses were shown to be dependent on the dose rate, a similar behavior to that of pure silica core fibers. Metal impurities such as phosphorus or alkalis added to germanium doped silica core were found to change the glass

structure significantly, producing the precursors of a defect center related to the  $\gamma$ -ray-induced loss and increasing sensitivity to  $\gamma$ -irradiation. 11 refs.

Iino, Akira (Furukawa Electric Co, Ichihara, Jpn); Tamura, Junich. *J Lightwave Technol* v 6 n 2 Feb 1988 p 145-149.

**074010 OPTICAL AND MECHANICAL PROPERTIES OF INFRARED FIBERS.** Optical and mechanical properties have been investigated for  $As_2S_3$  and  $As_2Se_3$  glass fibers and a KRS-5 polycrystalline fiber. A bending effect was serious for a KRS-5 fiber but not for chalcogenide fibers. In an aging test, a KRS-5 fiber showed a deterioration of transmissivity due to adsorption of moisture as well as plastic deformation of the crystal. Optical loss spectra of chalcogenide fibers were observed to change characteristically due to environmental factors such as humidity, high temperature, and ultraviolet radiation. The potential usefulness of these fibers is discussed. 17 refs.

**074011 PROPAGATION CONSTANT AND WAVEGUIDE DISPERSION OF SINGLE-MODE FIBERS MEASURED FROM THE FAR-FIELD.** Wave-length-dependent measurements of the far-field pattern can be evaluated to yield a mode-field radius. It was recently proposed to fit these data to a formula that contained all the parameters necessary to construct an empirical relation for the wavelength dependence of the propagation constant. The authors report on the feasibility of this technique, using actual measurement data. They discuss the calculation of the waveguide dispersion from the measured mode-field radius. In both cases the choice of the empirical fitting function proves to be of great importance. 5 refs.

**074016 LIMITATION OF TRANSMISSION DISTANCE AND CAPACITY DUE TO POLARISATION DISPERSION IN A LIGHTWAVE SYSTEM.** The length dependence of group delay differences between orthogonally polarized modes has been investigated experimentally for real single-mode fibers ranging from 0.1 km to 100 km. The mean group delay difference is a constant value of 0.67 ps, over a length of more than 1 km. The mode coupling coefficient of random mode mixing which causes pulse broadening has been estimated to be  $6.13 \times 10^{-3} \text{ m}^{-1}$ . A light pulse will broaden by 17 ps after traversing a 100 km-long fiber. This may restrict single-mode fiber systems to a bit rate of 10GHz for lengths over 150 km. (Author abstract) 10 refs.

**074018 COUPLING BETWEEN TWO DOUBLY CLADDING SINGLE MODE FIBERS.** An accurate analytic expression of coupling coefficient between two parallel doubly cladding single mode fibers is given in this paper. The coupling coefficients as a function of normalized frequency parameter  $V$  are calculated for fibers with raised, matched, and depressed inner cladding indices. The coupling coefficients as a function of normalized distance  $D/a$  are also given with different  $V$ . The formula can be used to compute both the coupling coefficients for both x-polarized modes and the coupling of y-polarized modes further. It can also be used to analyze the coupling between two fibers with their large refractive-index difference, as well as polarization characteristics of optical fiber couplers. (Author abstract) 7 refs. In Chinese.

Chen, Zhihao (Fujian Teachers Univ, China); Yao, Huihai. *Guangxue Xuebao* v 8 n 4 Apr 1988 p 379-384.

**074019 POLARISATION-MAINTAINING FIBRE COUPLES WITH MISALIGNED BIREFRINGENT AXES.** A recently developed formulation of the coupling between polarisation maintaining fibers is applied to the study of the dependence of the properties of tunable polarisation maintaining couplers on the angular misalignment between the transversal principal axes of the two individual fibers. When the cores are close enough it is shown that while the same coupling ratio can be obtained at several transversal settings of the coupler,

different behaviour is exhibited by the extinction ratio. For a transversely tunable coupler made of 3 mm beat-length fibers with a 5° misalignment, two 3 dB settings result in polarisation isolations of 18 dB and 40 dB. (Edited author abstract) 9 Refs.

**074020 UNIVERSAL SINGLE-MODE DISPERSION-FLATTENED FLUORIDE FIBRE DESIGNED FOR OPTIMUM PERFORMANCE FROM 1.5 TO 2.9  $\mu\text{m}$ .** A simple step-index with depressed-cladding single-mode fluoride fiber gives excellent dispersion flattening over a broad spectral range, 1.5-2.9  $\mu\text{m}$ . The extrinsic losses due to macrobending, microbending and splicing are minimized. This design enables the use of fluoride fibers at about 1.55  $\mu\text{m}$  and later can be upgraded to 2.55  $\mu\text{m}$ , where predicted losses are significantly less than those of silica fibers at 1.55  $\mu\text{m}$ . (Edited author abstract) 9 Refs.

Sunak, H.R.D. (Univ of Rhode Island, Kingston, RI, USA); Bastien, S.P. *Electron Lett* v 24 n 14 Jul 7 1988 p 879-880.

**074021 SINGLE-MODE FIBRES OPERATING AT FEW-MODE WAVELENGTHS.** There are communication systems where the initial requirement is for moderate bit-rates and transmission distances, but where the ability to upgrade for future applications is important. One way of designing such a system may be to combine readily available low-loss, high-bandwidth single-mode fibres, designed for optimum performance at  $\lambda = 1.3 \mu\text{m}$ , with economical and reliable LEDs that emit light at  $\lambda = 0.85 \mu\text{m}$ . Such a system would no longer be single-mode; the consequences for fibre loss and dispersion of allowing the second mode to propagate are examined and used to predict the performance limits for a two-mode fibre system. (Edited author abstract) 10 Refs.

**074024 CHARACTERIZATION OF SINGLE MODE FIBRES FOR COHERENT SYSTEMS.** In the last few years the use of single-mode fibers has grown and the relevant parameters of interest in the system design have been identified and measured. At the same time the values achieved for attenuation and dispersion coefficient have nearly reached theoretical limits so that the future improvement of system performances will rely only on transmitted power increase and/or coherent detection use. A further step will be the use of WDM or FDM systems to increase the information carrying capacity of the single fiber. In view of these developments further characteriza-

tion of the fiber will be needed, mainly dealing with polarization properties and nonlinear effects. (Author abstract) 44 Refs.

**074025 ULTRAVIOLET PULSE TRANSMISSION IN OPTICAL FIBRES.** This paper explores the limitations of silica fibers for pulsed u.v. transmission and reports photodegradation limits and power density performance characteristics. Technical innovations to extend the operating capabilities of optical fibers for the u.v. are described. These include the use of special designs of input fiber taper sections, to change the damage threshold from that of the surface to that of the bulk, and the design and performance of flexible fluid-filled fibers of increased cross-sectional area. (Edited author abstract) 29 Refs.

**074026 EVOLUTION OF CIRCULARLY POLARIZED PULSES IN NONLINEAR OPTICAL FIBRES.** The discussion in this paper is centered upon the evolution of circularly polarized pulses for a length of optical fiber in which the beat length and pulse height remain constant, but the size of the group velocity dispersion is varied. The paper essentially contains a preview of work in progress on a penetration into a rather difficult parameter space. It begins with an overview of the concept of critical power and stability and then follows a route from the existing body of c.w. work on nonlinear birefringence into the soliton regime. Although this is a difficult area, the general aim is to test the validity of certain critical power conclusions that have arisen in the c.w. case, as a transition from c.w. propagation to pulse mode is made. The preliminary calculations reported here seem to indicate that the clear-cut features of the c.w. case are not maintained. (Author abstract) 14 Refs.

## Physical Properties

**074028 CHARACTERISTICS OF DISPERSION-SHIFTED FIBERS.** This paper describes the bending property and dispersion controllability of dual shape core (DSC) and  $\alpha$ -index core fibers that have zero dispersion at 1.55  $\mu\text{m}$ . The bending characteristics are examined at constant splice loss. DSC fiber has a smaller bending loss than  $\alpha$ -index core fiber, and better bending characteristics than with the 1.3  $\mu\text{m}$ -optimized fiber can be expected. Dispersion controllability of a DSC fiber is also superior to that of an  $\alpha$ -index core fiber. (Author abstract) 13 Refs. In Japanese.

**074029 BEND LOSSES OF HIGHER-ORDER MODES IN DISPERSION-FLATTENED MULTIPLE-CLAD OPTICAL FIBRES.** The bending losses and effective cutoff wavelengths of the disturbing  $\text{LP}_{11}$  and  $\text{LP}_{02}$  modes in dispersion-flattened, multiple-clad, quasi-single-mode fibers have been evaluated numerically. Even when the theoretical cutoff wavelengths of the  $\text{LP}_{11}$  and  $\text{LP}_{02}$  modes are within the usual interval of operating wavelengths ( $1.3 < \lambda < 1.7 \mu\text{m}$ ), because of the extremely large bending losses of these modes, the effective cutoff wavelength can be below 1.3  $\mu\text{m}$ . These fibers are thus effectively single-mode. (Author abstract) 9 Refs.

**074030 KERR MODULATION OF SIGNALS AT 1.3 AND 1.5  $\mu\text{m}$  IN POLARISATION-MAINTAINING FIBRES PUMPED AT 1.06  $\mu\text{m}$ .** Optically induced high-speed modulation of the output of semiconductor lasers at 1.3 and 1.5  $\mu\text{m}$  has been achieved in polarization-maintaining fibers pumped with the output from an Nd:YAG laser. (Author abstract) 8 Refs.

Byron, K.C. (STC Technology Ltd, Harlow, Engl). *Electron Lett* v 23 n 24 Nov 19 1987 p 1324-1326.

**074031 WORLDWIDE STATUS OF DISPERSION-MODIFIED SINGLE-MODE FIBRES.** The state of the art in the field of dispersion-flattened and dispersion-shifted fibers is reviewed with emphasis on the preparation of dispersion-flattened fibers by means of the low pressure plasma activated chemical vapor deposition process. Dispersion data, loss characteristics and, where available, coupling, splicing, and bending performance of fibers with various refractive index profiles are compared to the corresponding data of conventional single-mode fibers. (Edited author abstract) 38 Refs.

Bachmann, P.K. (Philips GmbH, Forschungslaboratorium, Aachen, West Ger). *Philips J Res* v 42 n 4 Nov 23 1987 p 435-450.

**074032 OPTICAL FIBRE AS SENSORS.** The temperature, refractive index, concentration and other environmental conditions surrounding the fiber is being sensed in terms of loss characteristics of different conditions of fiber. The loss characteristics of fiber by liquid over unclad fiber or tapered fiber (with or without clad) and also liquid over core clad behaving as three region fiber in the leaky ray zone are analyzed and verified with experimental results. The simplicity and the sensitivity of the liquid characteristics for the different systems are shown. (Author abstract) 9 Refs.

## Polishing

**074033 NEW APPROACHES TO TERMINATION.** Efficient light transmission via fiber requires minimal losses at each termination - those breakable or nonbreakable connections used to mate fibers, transmitting and receiving equipment, and other active and passive devices. Currently, there are three prevalent fiber optic termination applications: telecommunications, data communications and medicine. Polishing of fiber ends requires different techniques for different applications. And the requirements are growing along with a host of new applications. This paper discusses the use of polishing as a means of producing efficient low-light-loss terminations.

Drexel, R. Patrick; Nelson, James A.; Schneckner, John. *Photonics Spectra* v 22 n 3 Mar 1988 p 101-102, 104, 106.

**074034 OPTICAL FIBRE POLISHING WITH A MOTOR-DRIVEN POLISHING WHEEL.** A whole range of optical fibre components-from couplers to modu-

lators and switches—can be achieved by interacting with the evanescent field of an optical fibre. The polishing of optical fibres is demonstrated using an abrasive polishing wheel. The approach requires that only the fibre itself is polished and allows arbitrarily long interaction lengths to be generated with losses of less than 0.1 dB. (Edited author abstract). 3 Refs.

## Production

**074035 HIGH-SPEED DRAWING AND COATING SYSTEM FOR OPTICAL FIBERS.** Kobe Steel has recently put on the market a high-speed optical fiber drawing system. This report describes the details of the components including the high-performance drawing furnace, pressurized coating die, and high-precision fiber diameter control apparatus. This system makes possible the low-cost production of optical fibers with high quality. (Author abstract) 1 ref. In Japanese.

Akita, Toshiaki; Nagaoka, Tatsuo. *R&D Res Dev Kobe Steel Ltd* v 38 n 2 Apr 1988 p 25-27.

**074036 OPTICAL FIBRE PRODUCTION AND MEASUREMENT.** Excellent quality graded-index and single-mode fibres can be produced by the MCVD method that allows high production efficiency, high automation of the process, high production yield, and flexibility for all common types of optical fibres. Introduction of the sleeving techniques has made it possible to produce large preforms. Low OH substrate tubes will further increase the efficiency of single-mode fibre production. High quality loose tube and multifibre cables have been produced using fibres primary coated using the dual pressure coater method, and secondary-coated with a horizontal extrusion line facilitating fibre overlength control with the bias capstan. 19 Refs.

Kurki, J. (Nokia Cable Machinery, Helsinki, Finl). *Wire Ind* v 55 n 654 Jun 1988 p 421-429,433.

**074037 DISPERSION LIMITED PRODUCTION TOLERANCES OF SINGLE-MODE FIBERS.** Based on profile-independent expressions, optimum values of the dispersion slope at the zero-dispersion wavelength for single-mode fibers are given, as a function of production tolerances. These optimum values minimize the spread in dispersion or maximize the usable wavelength interval of the fiber. Maximum allowable tolerances for dispersion-flattened fibers are found. 9 refs.

## Protective Coatings

**074038 POLYMER COATINGS FOR LIGHT-GUIDE FIBERS.** In order to protect their surface from damage caused by abrasion, optical fibers must be coated with a polymer as they are drawn. The properties of the coating are crucial to the performance of the fiber. Two commonly used types of fiber coating geometries are illustrated. Three types of primary coating materials have been commercially used: thermally-curable silicones, UV-curable prepolymers, and thermoplastic rubber compounds. Typical modulus-temperature characteristics for these materials are displayed.

Blyler, L.L. Jr. (AT&T Bell Lab, Murray Hill, NJ, USA); Hart, A.C. *AICHe Symp Ser* v 83 n 258 1987, Fiber Opt Eng: Process and Appl (Pap from Natl AICHe Meet Held 1984-1986) p 29-31.

**074039 TEMPERATURE DEPENDENCE OF OPTICAL FIBER COATINGS FOR SINGLE-MODE**

**FIBER.** The physical properties of a coating material can greatly influence the extent of microbending losses in single-mode optical fiber. Therefore the reduction of microbending sensitivity is important to the operation of very low-loss fiber in open-channel cable for temperatures between  $-40^{\circ}$  and  $+60^{\circ}\text{C}$ . This paper describes the microbending sensitivity of various single-layer and composite acrylate coatings. (Author abstract) 5 refs.

**074041 EFFECT OF PROTECTIVE POLYMER COATING ON THE STRENGTH OF FIBER OPTICAL LIGHT GUIDES OF CHALCOGENIDE GLASSES.** Strength and crack resistance of fiber light guides of IR-range of chalcogenide glasses of the  $\text{Ge}_3\text{As}_{38}\text{Se}_{57}$  and  $\text{Ge}_5\text{As}_{38}\text{S}_{57}$  composition with protective polymeric shell of fluoroplastic-42 and without it are investigated. It is shown that polymeric coating with the surface protection essentially strengthens the light guide. The main reasons of strengthening are analyzed and possibility of an essential rise in the mechanical strength and reliability of no-failure operation of light guides made of chalcogenide glasses is registered. (Author abstract) 5 refs. In Russian.

**074042 RECENT DEVELOPMENTS IN HERMETICALLY COATED OPTICAL FIBER.** Recent progress on the development of hermetically coated optical fiber is presented. This fiber provides improved fatigue resistance; high usable strength; and excellent resistance to hydrogen permeation,  $25\text{-}90^{\circ}\text{C}$  water, and corrosive chemicals such as hydrofluoric acid and boiling sodium hydroxide. These attributes make the hermetically coated fiber an excellent candidate for use in undersea cables and other special applications where a harsh environment prevails. 17 refs.

**074044 QUALITY CONTROL OF LONG FIBRE OPTIC CABLES.** This article shows that routine quality testing of fibre optical cables is best done through the OTDR technique. A computer-assisted system has been developed for this purpose. Improved production methods now enable fibre manufacturers to supply fibres with lengths up to 12 km or more on a regular basis. To take full advantage of this development, it is not only necessary to process these fibres as one unit but also to measure them as one single cable production length in such a manner that after dividing into individual sections, these do not need further measurement. 2 Refs.

## Radiation Damage

**074045 INDUCED THERMAL DAMAGES TO FIBER LIGHTGUIDES.** The dynamics of melting of a lightguide under the effects of radiation propagating in it are investigated. Estimations are found for the rate of a melting wave in different modes, along with the critical radiation power. (Author abstract) 7 refs.

Romanovskii, M.Yu. *Sov Phys Lebedev Inst Rep* n 5 1987 p 29-33.

**074046 FUSION NEUTRON DAMAGE IN OPTICAL FIBERS.** There have been many papers on radiation damage in optical fibers. However, most papers have described irradiation experiments utilizing a  $\gamma$ -source and applications to nuclear power plants, fuel reprocessing plants and others. Insufficient data seem to be available for fusion neutron damage. Irradiation experiments by a D-T neutron source are essential, and data on fusion neutron damage are directly useful for fiber optics in fusion reactor diagnostic systems. The purpose of the present paper is to show the data on fusion neutron response of optical fibers which have been recently developed and to determine how long they can be effectively used in the fusion neutron environments. 3 refs.

**074050 FIBER OPTIC SIGNAL ATTENUATION BY SECONDARY IONIZING RADIATION IN NUCLEAR ENVIRONMENTS.** Irradiation of optical fiber waveguides by ionizing radiation can cause an increased loss in optical transmission. The effect of the loss was measured on several commercially available pure silica-core boron-doped clad fibers irradiated with thermal neutrons from a nuclear reactor. Optical absorption was measured over the 400-1100-nm range during neutron irradiation. It was found that the attenuation of optical transmission by thermal neutrons is caused by defects produced by alpha particles produced in boron-neutron reactions.

**074051 ASSESSMENT OF RADIATION-INDUCED LOSS FOR AT&T FIBER-OPTIC TRANSMISSION SYSTEMS IN THE TERRESTRIAL ENVIRONMENT.** Environmental radiation dose rate estimates are provided for both outdoor terrestrial and indoor environments. Laboratory radiation sensitivity measurements are reported for the AT&T standard single-mode fiber and standard and radiation-hardened multimode fibers. These are used to estimate typical system losses for long-haul, trunk, feeder, local area network, and optical data environments. It is reported that radiation-induced loss in unusually harsh environments can be minimized by using the radiation hardened 62.5/125- $\mu$ m multimode fiber, which has sensitivities roughly an order of magnitude lower than the standard product at 0.85  $\mu$ m and almost two orders of magnitude lower at 1.3  $\mu$ m. 7 refs.

Haber, Janice B. (AT&T Bell Lab, Norcross, GA, USA); Mies, Eric W.; Simpson, Jay R.; Wong, Sweet F. *J Lightwave Technol* v 6 n 2 Feb 1988 p 150-154.

**074052 INTERLABORATORY COMPARISON OF RADIATION-INDUCED ATTENUATION IN OPTICAL FIBERS - I: STEADY-STATE EXPOSURES.** A comparison of the losses induced at 0.85  $\mu$ m in three all glass-pure silica core optical fibers by steady-state radiation exposures has been made among five laboratories. Both the growth of the attenuation during irradiation and the recovery following exposures of 3000 and 10<sup>5</sup> rads have been measured. Although a standard set of parameters was attempted by all laboratories, the slight divergences (0.45  $\leq \sigma \leq$  0.99 dB/km) observed in some data indicate sensitivity of the results to factors such as photobleaching, injection conditions, and sample coil diameter. 15 refs.

Friebele, E. Joseph (US Naval Research Lab, Washington, DC, USA); Taylor, Edward W.; Turguet de Beauregard, Guy; Wall, James A.; Barnes, C.E. *J Lightwave Technol* v 6 n 2 Feb 1988 p 165-171.

**074053  $\gamma$ -RAY AND NEUTRON IRRADIATION CHARACTERISTICS OF PURE SILICA CORE SINGLE MODE FIBER AND ITS LIFE TIME ESTIMATION.** The investigation of the induced loss for a single-mode (SM) optical fiber under  $\gamma$ -ray irradiation and neutron irradiation is described. An estimation method for induced loss with low dose rate and long-term  $\gamma$ -ray irradiation is proposed. The induced loss of pure-silica-core SM fiber is estimated to be 50 times lower than that of germanium containing silica-core SM fiber after irradiation with 1 R/h for 25 years. 1 ref.

K. *IEEE Trans Nucl Sci* v 35 n 1 Feb 1988, 34th Nucl Sci Symp, San Francisco, CA, USA, Oct 21-23 1987 p 894-897.

**074054 FUSION NEUTRON DAMAGE ON OPTICAL FIBERS AND OPTOELECTRONIC DEVICES.** Radiation-resistant optical fibers fabricated with purified silica glass were irradiated at room temperature with 14-MeV neutrons from the RTNS-II. The induced loss in light transmission was measured in situ during irradiation. It was found that the fusion neutron response of the optical fibers can be approximately classed in three types as follows: (1) a large induced loss with little recovery; (2) a large induced loss with a quick recovery; and (3) a small induced loss with a saturated tendency. The induced-loss rate has been calculated on the basis of damage components that depend mainly on neutron fluence and show little recovery. Fusion neutron irradiation effects on related optoelectronic devices and their hardness levels are shown. These are the neutron fluences at which important performance parameters of the devices begin to degrade. The data are useful for fiber-optics design for fusion diagnostic systems. 2 refs.

**Reliability** See Also TELECOMMUNICATION CABLES—Submarine.

**074055 TOUGHER FIBER FOR THE FOG-M.** Military applications such as the fiber-optic guided missile (FOG-M) require long-length, highly reliable optical fibers that usually are proof stressed after manufacture to insure reliability. This article describes a new approach to producing long length, highly reliable optical fibers. This involves modifying the composition of fibers produced by the outside vapor deposition (OVD) process. Change in the chemistry of glass has been shown to increase fiber resistance to fatigue. 14 refs.

Ritter, J.E.; Helfinstine, J.D. *Photonics Spectra* v 21 n 8 Aug 1987 5p between p 90 and 98.

**074056 LONG-TERM RELIABILITY OF TRANSMISSION LOSS IN OPTICAL FIBER CABLES.** Increased optical-fiber cable losses due to hydrogen are discussed. A mathematical model is developed to predict the growth of hydrogen concentration in the cable, which is determined by the evolution from organic cable materials and permeation through the cable sheath. This cable model, together with the measured parameters for the cable materials, explains the measured results. Design criteria for the allowable hydrogen evolution from cable materials and for the cable sheath structure are established on the basis of the model. 7 refs.

## Repair

**074058 LOW-LOSS FUSION SPLICING OF PCVD-DFSM FIBERS.** Fusion splicing of dispersion-flattened single-mode (DFSM) fibers results in wave-

length-independent average repair splice losses of 0.05 dB. These losses are as low as for conventional single mode (SM) fibers and field application is not limited. Splices between DFSM fibers and conventional SM fibers showed surprisingly low splice losses in spite of the large difference in spot size. This is caused by internal diffusion processes which result in a steady transition of the spot sizes. 9 refs.

## Robotic Assembly

**074059 MICROROBOT PERFORMS TASK OF PIGTAILING OPTICAL FIBERS.** The Microrobotics Division of Dukane Corp., St. Charles, Ill., has designed the AL5010 Microrobot System, an assembly robot for the challenging task of pigtailing single-mode optical fibers. By automating the manufacture of semiconductor lasers and other optoelectronic devices, the AL5010 makes obsolete the manual alignment of optical fibers to active components. Replacing manual operation reduces rework demands and cycle times. (Edited author abstract)

**074060 OPTICAL FIBER SENSOR FOR THE MEASUREMENT OF PRESSURE.** This paper describes the design, construction and testing of a fiber optic pressure sensor based on a reflecting Fabry-Perot etalon. The etalon comprised one fixed mirror and a second mirror designed to flex under the action of the pressure being monitored. A single multimode fiber was used to connect the passive, remote sensor to the transmitter/receiver section, and dual wavelength referencing was used to eliminate the effects of bending-induced attenuation in the fiber. (Author abstract) 1 ref.

## Spectroscopic Analysis

**074061 NEW TECHNIQUE FOR SPECTROSCOPIC ANALYSIS OF INSULATING SINGLE CRYSTAL FIBERS.** A new technique for determining the optical properties of insulating single crystal fibers is presented and applied to Titanium-doped Sapphire, Spinel and YALO. The fibers were grown at the Stanford University Center for Materials Research by a laser heated pedestal growth method and were about 1 mm in diameter and 5 cm long. We introduce a statistical treatment of radiation transport through fibers to account for multiple scattering and interference. In this analysis, the effects of multiple scattering are treated as a length dependent reflection from the bulk and combined with Fresnel surface reflection allow the prediction of absorption and emission characteristics. (Edited author abstract) 4 refs.

**074062 EXPERIMENTAL STUDY OF THE EVOLUTION OF CHIRPED SOLITON PULSES IN SINGLE MODE OPTICAL FIBERS.** The evolution of chirped soliton pulses relaunched into single mode fibres in the region of anomalous dispersion has been examined experimentally under conditions where the bandwidth of

the launched soliton pulse was up to seven times that of the transform limit. After relaunch, the soliton rapidly broadened approaching the condition where further broadening was solely due to transmission losses. The results are in good qualitative agreement with recent theoretical predictions. (Author abstract) 26 refs.

**074063 STIMULATED BRILLOUIN SCATTERING EXCITED BY A MULTIMODE LASER IN SINGLE-MODE OPTICAL FIBERS.** A steady state solution for stimulated Brillouin (SBS) in single-mode optical fibers when excited by a pump wave having discrete spectral components is derived. This solution is valid for any arbitrary ratio of the spontaneous Brillouin linewidth to the frequency separation of the adjacent modes. The solution can be extended to include a quasi-continuous spectrum for the pump wave. (Author abstract) 16 refs.

**074064 ABSORPTION AND FLUORESCENCE SPECTRA OF RARE EARTH IONS IN SILICA-BASED MONOMODE FIBER.** Rare-earth ions have been systematically incorporated into the cores of silica-based optical fibers, and the absorption and fluorescence spectra have been measured. The results provide basic data for a wide range of possible future fiber-based devices. For specific telecommunications applications, ions that could be useful for sources in the 1.3- $\mu$ m and 1.5- $\mu$ m low-loss windows are identified. It is suggested that  $\text{Er}^{3+}$ ,  $\text{Nd}^{3+}$ , and  $\text{Tm}^{3+}$  are the most promising ions for semiconductor pumping with GaAs-based laser diodes. 19 refs.

**074065 BANDWIDTH OF A SINGLE-MODE OPTICAL FIBER IN PSK COHERENT OPTICAL TRANSMISSION SYSTEMS.** The author examines propagation characteristics of PSK modulated signal light under the influence of the group velocity dispersion (GVD), the higher-order dispersion (HOD), and the nonlinear refractive index of a single-mode fiber. Emphasis has been placed on behavior at and near the zero-dispersion wavelength (ZDWL), where the HOD as well as the GVD would be important. It is found that propagation at the ZDWL is similar to that away from the ZDWL; the effect of the nonlinear refractive index can be comfortably ignored. The effect of HOD is found to induce self-amplitude modulation (SAM) at the ZDWL; the amplitude of PSK-modulated light becomes modulated as the light travels down the fiber. The SAM considered produces a power penalty in the PSK coherent fiber transmission, and determines the dispersion limit of such systems. As the operating wavelength moves away from the ZDWL, the effect of GVD becomes important relative to that of HOD. The significance of the results is examined. 23 refs.

Tajima, Kazuhito (NEC Corp, Kanagawa, Jpn). *J Lightwave Technol* v 6 n 2 Feb 1988 p 322-328.

**074066 1.55- $\mu$ m FIBER-OPTIC TRANSMISSION EXPERIMENTS FOR LONG-SPAN SUBMARINE CABLE SYSTEM DESIGN.** Results of 1.55- $\mu$ m transmission experiments at 140, 280, and 565 Mb/s involving conventional and dispersion-shifted single-mode fibers along the Fabry-Perot laser diode (FP-LD) and distributed-feedback laser diode (DFB-LD) optical sources are discussed. The results show which combination of optical fiber and optical source best meet the requirement of long repeater spacing for each bit rate. The results indicate that to achieve repeater spacing more than 100 km with dispersion-shifted fibers and FP-LD optical sources will impose strict requirements on both the optical fibers and

the optical sources even at 280 Mb/s. Alternatively, systems using DFB-LD optical sources will not degrade the transmission performances and will considerably loosen requirements on the fibers and optical sources. A combination of dispersion-shifted fibers and DFB-LD optical sources can further loosen the requirements on the fibers and optical sources in 560-Mb/s systems. 17 refs.

## Standardization

**074067 DEVELOPMENT OF PROPOSED FEDERAL STANDARD 1070: 62.5/125- $\mu$ m GRADED-INDEX, MULTIMODE OPTICAL FIBER WAVEGUIDES FOR ON-PREMISES APPLICATIONS.** This paper describes a process that has been successful in generating a specification to guide the user community in the procurement of single-size, multimode optical fiber for on-premises applications. This process began with an attempt to adopt an industry standard as a federal standard that would eliminate a multiplicity of choices available from the marketplace. The initial EIA-458-A Standard contained four 'preferred' sizes. Discussions both in a government standards committee and in an applications-oriented industry (EIA) working group indicated the desirability of recommending a single fiber size. The process by which the industry committee selected the 62.5- $\mu$ m core diameter/125- $\mu$ m cladding diameter multimode fiber is presented. The next element of the process was that of selecting the appropriate standard performance measures and attributes that would assure minimum performance of graded parameters such as attenuation and bandwidth, as well as a uniform specification of the product. (Edited author abstract). 3 Refs.

**074068 DETERMINATION OF THE INDIVIDUAL STRAIN-OPTIC COEFFICIENTS IN SINGLE-MODE OPTICAL FIBERS.** A method to determine the individual strain-optic coefficients in single-mode fibers is described. It is based on two photoelastic experiments, namely, the polarimetric measurement of optical activity induced by mechanical twist and the interferometric measurement of optical-path-length change induced by static longitudinal strain. For fibers with pure silica core and  $\text{B}_2\text{O}_3$  doped cladding, the optical activity per unit twist rate and the phase change per unit fiber elongation have been measured to be 0.1472 and  $1.150 \times 10^7$  rad/m, respectively. The strain-optic coefficients have been measured to be  $p_{11} = 0.113$  and  $p_{12} = 0.252$ , 7% lower than those of bulk silica. 15 refs.

**Stresses** See Also MATERIALS TESTING; TELECOMMUNICATION CABLES—Submarine.

**074069 STRESS-APPLIED OPTICAL FIBER HAVING INHOMOGENEOUS CORE.** To extend the freedom in the design of polarization-maintaining single-mode optical fiber, a stress-applied fiber with inhomogeneous core has been investigated. The refractive index in the core has an  $\alpha$ -power profile, and the refractive index of the stress-applying parts is decreased by doping. The fiber characteristics are evaluated by stress analysis and modal analysis, using the finite-element method useful for arbitrary refractive-index profile. For modal analysis, a new scalar variational expression useful for the analysis of weakly guiding birefringent fibers is presented. Using this expression, the polarization-mode properties of the fiber are studied in detail. (Edited author abstract) 12 refs.

## Structure

**074070 OPTICAL AND STRUCTURAL INVESTIGATION OF  $\text{Nd}^{3+}$  IN SILICA-BASED FIBRES.** We have previously reported the fabrication and properties of  $\text{Nd}^{3+}$ -doped silica-based optical fiber in concentrations kept low in order to avoid clustering effects. This letter furthers this study and reports the optical and structural properties of  $\text{Nd}^{3+}$ -doped silica-based optical fiber in concentrations which extend well into the clustered phase. The behavior of the lanthanides in silica is similar, hence inferences can be made for all these ions from this work. Silica-based optical fibers contain clusters when doped with  $\text{Nd}^{3+}$  at concentrations above  $10^3$  ppm. Fluorescence spectra and time-resolved measurements have shown that these clusters are  $\text{Nd}^{3+}$ -rich crystalline phases. 7 refs.

**074071 LIGHT SCATTERING MEASUREMENT IN PMMA OPTICAL FIBERS.** A new light scattering measuring system was developed to investigate the heterogeneous structure in plastic optical fibers (POF). Measurements were conducted on commercial PMMA POF of different diameters. The results showed that the correlation length, which characterizes the size of a heterogeneous structure, is substantially larger in POF than in a bulk PMMA specimen, and increases with decreasing fiber diameter. These facts suggest that some structural changes such as molecular orientation and residual stress might be induced during POF formation, resulting in an additional scattering loss. ## Thermal Effects

**074076 OPTICAL-FIBER THERMAL MODULATOR.** A device which utilizes temperature sensitivity of optical fibers to modulate the light in an optical-fiber interferometer is described. Desired temperature changes are accomplished by passing current through a thin conductive coating on the surface of a short length of the fiber in the interferometer. Modulation rates up to tens of kilohertz have been achieved with an optical fiber which has had a gold coating deposited directly onto the silica fiber. Fiber temperature changes of over 200 K were easily attained and resulted in a phase difference of many radians between the two arms of the interferometer. 13 refs.

**074077 TEMPERATURE DEPENDENCE OF PULSE WAVEFORM DISTORTION IN A STEP-INDEX TYPE MULTIMODE INFRARED OPTICAL FIBER.** Introducing temperature-dependent terms into the propagation constant and its derivatives, and extinction coefficient of a core material of optical fiber, the equation of pulse propagation in a multimode fiber is derived, allowing us to evaluate the temperature dependence of a pulse waveform such as the peak-intensity, the pulse duration or width and the pulse delay-time at the peak as a function of ambient temperature. Using the weighting function for higher order modes in the above equation, the theoretically calculated waveforms are compared with the mode-locked He-Ne 3.39  $\mu$ m laser pulses propagated through As-S fiber over the range from room temperature to  $-220^\circ\text{C}$ , being in good agreement each other. (Author abstract) 12 refs.

## Vapor Deposition

**074078 HIGH-RATE FABRICATION OF OPTICAL FIBER PREFORMS BY THE MULTI-FLAME VAD METHOD.** A new type of burner with a multi-flame structure is proposed for high-rate fabrication of optical fiber preforms in the vapor-phase axial deposition method (VAD). Fine glass particles synthesized using the double-flame burner under various conditions were characterized by SEM and the BET method. It was confirmed that particle size and deposition rate could be increased by using the new burner. The multi-flame VAD method

makes it possible to synthesize whole fiber preforms for single-mode optical fibers at a high deposition rate of more than 10 g/min. (Author abstract) 17 refs.

## Vibration

**074079 POLARIZATION FLUCTUATION CHARACTERISTICS OF A HIGHLY BIREFRINGENT FIBER SYSTEM UNDER FORCED VIBRATION.** Polarization characteristics in environmental disturbance are evaluated, in terms of the signal-to-noise ratio (SNR), which is defined as the ratio of a mean to a standard deviation of time-varying signals. The SNR is computer-simulated, assuming a Gaussian probability distribution for the random variables, i.e., birefringent axis, linear retardance, and polarization mode-coupling. These parameters are assumed to fluctuate owing to the force vibration of a loudspeaker. A comparison of the numerical results with the experimental SNR provides a direct connection between fluctuations of the state of polarization (SOP) and SNR of received signals modulated by polarization noise in highly birefringent fiber systems. 19 refs.

**Vibrations** See Also FIBER OPTICS—Mathematical Models.

**074080 CORRELATION PROCESSING OF FLUCTUATING OPTICAL WAVES GUIDED IN AN EXTERNALLY PERTURBED BIREFRINGENT SINGLE-MODE FIBER BY OPTICAL HETERODYNE INTERFEROMETRY.** A description is given of experimental studies on the correlation processes for the optical waves guided in a birefringent single-mode fiber exposed to random vibrations. A laser beam with orthogonally polarized two-frequency components is launched into the fiber in such a way that the polarization directions of the two-frequency components coincide with the birefringent axes of the fiber. On leaving the fiber, its orthogonal components, modulated at random in phase and amplitude, are superimposed with a reference laser beam with two-frequency components; two-beat photocurrents are produced from the combination of different frequency components of the signal and reference laser beams. The beat photocurrents can yield the fluctuating phase and amplitude components of the guided optical waves, which are statistically processed by use of a signal analyzer. Autocorrelation and cross-correlation functions for the fluctuation components are given together with their corresponding power spectra. Characteristic features extracted from the measured results are explained. 7 refs.

**074081 PHASE-ONLY FILTER AS MATCHED SPATIAL FILTER WITH ENHANCED DISCRIMINATION CAPABILITY.** The optical and digital analysis of the discrimination capability of the phase-only filter is presented. The comparison between the discrimination capability for this filter and high-pass matched spatial filter of different kinds is realized. (Author abstract) 20 refs.

Chlaskinska-Macukow, K. (Warsaw Univ, Warsaw, Pol); Nitka, T. *Opt Commun* v 64 n 3 Nov 1 1987 p 224-228.

**074082 FILTERS AND GRATINGS: NOT ALWAYS A SIMPLE CHOICE.** Historically, the optical engineer has had three choices for defining the response of an

optical system to a narrow band of wavelengths: filters, diffraction gratings or prisms. In recent years we have witnessed exciting developments in grating and filter technology. Where we could make our choices so easily in the past, we now need to rethink what is 'few' and what is 'many.' New capabilities make the optical engineer rethink the boundary between filters and gratings in design.

Pierson, Arthur H. (Pierson Associates, Andover, MA, USA). *Lasers Optonics* v 6 n 8 Aug 1987 p 63-67.

**074083 PHOTON INTENSITY CONTROL WITHOUT FILTERS.** The authors have demonstrated an alternative technique to control light intensity adjusting direct light source brightness instead of employing filters. This allows a computer to directly control a pulse generator through a D-A converter. The precision of photon intensity control can be improved to less than 1%. Since the technique does not require any filter replacement, a tube can be isolated in a light tight box perfectly. The technique is at least as simple as that using filters and would be probably more simple in most practical situations.

**074084 MESURE DES TAUX DE REJECTION ELEVES DANS LES FILTRES INTERFERENTIELS. APPLICATION AU DEMULTIPLEXAGE OPTIQUE.** [Measurement of High Rejection Rates in Interference Filters. Application to Optical Demultiplexing.] High performance interference filters are usually used for multiplexing or demultiplexing in optical telecommunications. It is necessary to characterize these filters for implementation in a demultiplexer. Particularly in the rejection bands, transmission values which do not exceed  $10^{-4}$ , or even  $10^{-5}$  are aimed at values. Generally, these values cannot be obtained with a classical spectrophotometer. Therefore, a special equipment had to be developed and built. This equipment makes it possible to master measurement conditions (aperture, incidence, resolution, ...) and particularly it has the high spectral purity required for this type of application. It is shown that actual performances of these interference filters are very close to theoretical previsions. This applies as well to the transparency band shape as to the transmission values in rejection bands. This result is confirmed by computer simulation of the effect of realization errors and measurement conditions on the optical properties of multilayers stacks. (Author abstract). 4 Refs. In French.

**074085 OPTICAL COATINGS FOR LARGE AREA INTERFERENCE FILTERS.** The appearance of optical filters on a large scale as heat reflecting coatings on domestic windows heralds the advent of techniques and materials for a range of applications which are far removed from the ultra-high performance, and cost, of multilayer filters used hereto. These new coatings use interference anti-reflection layers on either side of a thin metal layer. They are prepared by high rate reactive planar magnetron sputtering onto a large area of glass or plastic substrate. This technique is critically assessed and materials considered which will allow more complex filters to be made. In particular the preparation of a high index dielectric film of  $\text{SnO}_2$  and a low index film of aluminum oxyfluoride is described. Illustrations of some applications of these are given. (Author abstract) 9 refs.

## Design

**074087 OPTIMISED DESIGN OF ODD-ORDER OPTICAL LOWPASS AND HIGHPASS MULTILAYER FILTERS BY METHOD OF COEFFICIENT MATCHING.** An algorithm is developed to design optimized lowpass multilayer filters by equating the coefficients of the multilayer transmittance with those of the Chebyshev transmittance. Results obtained for a 17th-order, lowpass multilayer show that it has optimized Chebyshev-like performance in the passband. Its transmittance characteristic falls short of optimum performance in that the ripples at low frequencies are less than the specified value. Nonetheless, its performance compares favorably with other well-established methods of design. By contrast, a high-pass multilayer, designed using the same approach, has a performance which falls short of the accepted norm. Evidence leads us to conclude that coefficient matching with Chebyshev polynomial is more suited to the design of lowpass multilayers than highpass multilayers. (Author abstract) 20 refs.

Chen, T.C. (Hong Kong Polytechnic, Hong Kong). *IEE Proc Part J* v 135 n 2 Apr 1988 p 166-177.

## Efficiency

**074088 INVESTIGATION OF LIGHT FILTER THERMAL CONDITIONS.** Thermal conditions and radiation flux density distribution on the traditional and double filters consisting of two components, viz., a main film and an auxiliary/protective glass with air separation were studied. Radiation losses were calculated for the filters. Temperature dependence for the transmittance of the glass in-bulk painted filters is given. The dependence is responsible for a nearly two-fold drop in floodlight efficiency in the sensitivity range of a multislit photocathode receptor. The temperature properties and cost of the double filters render them advantageous over the traditional ones. (Author abstract) 6 refs. In Russian.

Rakviashvili, A.G.; Sysun, V.V. *Svetotekhnika* n 1 1988 p 18-21.

## Laser Applications

**074089 EXPERIMENTAL DEMONSTRATION OF A DIODE LASER-EXCITED OPTICAL FILTER IN ATOMIC Rb VAPOR.** A narrow-bandwidth optical filter using diode-laser-pumped atomic Rb vapor has been demonstrated. Excellent rejection of off-resonant laser photons has been achieved. The measured detection bandwidth was 1.18 GHz at the Rb cell temperature of 150°C, which shows a good agreement with the calculated detection bandwidth of 1.02 GHz. The quantum efficiency of the atomic Rb vapor laser-excited optical filter is linearly dependent on the diode laser pumping power. 8 refs.

## Measurements

**074092 TUNABLE SINGLE-MODE FIBER REFLECTIVE GRATING FILTER.** A single-mode fiber tunable reflective filter is demonstrated by translating a fan-shaped grating structure through the evanescent field of a side-polished fiber. Filter linewidths of about 1 nm were measured over tuning ranges in excess of 65 nm. Reflectivities as high as 88% were observed. Using the fiber filter as a feedback element, a multimode semiconductor laser was observed to oscillate in a single mode which could be discretely tuned over a wavelength range of 26 nm. 5 refs.

## Multiplexing

**074093 FDM-FSK STAR NETWORK WITH A TUNABLE OPTICAL FILTER DEMULTIPLEXER.** An optical frequency-division-multiplexed star network is analyzed and demonstrated experimentally using two 45 Mbit/s frequency-shift-keyed laser channels at 1.5  $\mu$ m. A tunable fiber Fabry-Perot filter is used as demultiplexer. The analysis predicts and experiment supports a minimum channel spacing of about six times bit rate B for a single FFP and 3B for a tandem FFP. (Author abstract) 3 refs.

**Performance** See Also PATTERN RECOGNITION SYSTEMS—Components.

**074094 RELAXATION METHOD OF COMPENSATION IN AN OPTICAL CORRELATOR.** An iterative method is proposed for the sharpening of programmable filters in a 4-f optical correlator. Continuously variable spatial light modulators (SLMs) permit the fine adjustment of optical processing filters so as to compensate for the departures from ideal behavior of a real optical system. Although motivated by the development of continuously variable phase-only SLMs, the proposed sharpening method is also applicable to amplitude modulators and, with appropriate adjustments, to binary modulators as well. A computer simulation is presented that illustrates the potential effectiveness of the method: an image is placed on the input to the correlator, and its corresponding phase-only filter is adjusted (allowed to relax) to produce a progressively brighter and more centralized peak in the correlation plane. The technique is highly robust against the form of the system's departure from ideal behavior. (Author abstract) 4 refs.

**074095 CARBON AND BERYLLIUM EXTREME ULTRAVIOLET FILTERS: FAR-ULTRAVIOLET PERFORMANCE.** Designs for extreme-ultraviolet filters using thin carbon and beryllium foils are presented and their far-ultraviolet performance summarized. The transmission data yield values for the linear-absorption coefficients of beryllium and carbon in the wavelength range 1200-2000 Å which are compared with other published data in this and in the adjacent extreme-ultraviolet wavebands. Use of multiple foils is demonstrated to be an effective means of eliminating pin-holes, which may contribute significantly to the far-ultraviolet transmission. (Author abstract) 18 refs.

**074096 RECENT DEVELOPMENTS IN THE PRODUCTION OF NARROWBAND POSITION TUNED INTERFERENCE FILTERS FOR WAVELENGTH MULTIPLEXED OPTICAL FIBRE SYSTEMS.** The performance of position tuned multilayer interference filters for use in the 1250-1600 nm wavelength range is described and analysed. These new filters have an improved performance with a wider tuning range (> 250 nm) and reduced fwhm (< 10 nm) compared with earlier samples. These devices could find application for single channel selection in wavelength multiplexed single-mode optical fibre systems. (Author abstract) 9 refs.

**074098 NUMERICAL ANALYSIS OF DIFFRACTION FROM A SINUSOIDAL METAL GRATING.** Diffraction of plane waves by a metal grating of a sinusoidal cross section is investigated theoretically by considering a finite conductivity of the material. The analysis is based on the mode-matching method with a smoothing operation. The numerical results of the diffracted power from a sinusoidal gold grating are presented with sufficient accuracy for both P-polarization and

S-polarization. The results have been compared with those for perfectly conducting gratings. (Edited author abstract) 13 refs.

**074100 NON-UNIFORMITIES IN THICK DICHROMATED GELATIN TRANSMISSION GRATINGS.** The angular characteristics of transmission gratings are studied for the case when three parameters, namely the dielectric-constant modulation, the average dielectric constant and the grating vector vary with distance in the grating. The diffraction efficiency is worked out with the aid of a coupled-wave theory for linear and quadratic variation of the parameters. Gratings recorded in thick (~60 μm) dichromated gelatin plates are measured. The spatial variations of the parameters are deduced by comparing the experimental and theoretical results. (Author abstract) 20 refs.

**074101 ROTATING GRATINGS REVEAL THE TEMPORAL TRANSFER FUNCTION OF THE OBSERVING SYSTEM.** It is shown that a rotating sinusoidal grating is a useful sweep signal for the analysis of the temporal behavior of linear imaging systems. For a suitably chosen angular velocity and spatial frequency, the spatial a.c. component of the grating appears modulated in one dimension at the output of the system. The profile of this modulation is the temporal transfer function (TTF) of the system. A quantitative analysis of this effect is presented, and results from experiments with a photographic camera are shown. It is proposed to use this method in the field of vision research since it is presently the only way to demonstrate the complex-valued TTF of the visual system for suprathreshold grating stimuli. The main consequence of the first psycho-physical investigations was the discovery of a phase reversal at the origin of the TTF of the human visual system for gratings of low spatial frequency. (Author abstract) 16 refs.

**074102 FINITE-ELEMENT ANALYSIS OF PLANE WAVE DIFFRACTION FROM DIELECTRIC GRATINGS.** A method for analysis based on the finite element method has been presented as a procedure that enables analysis of a dielectric grating with an arbitrary profile. A systematic formulation has been presented from both TE and TM wave incidences. The analysis has been carried out for groove grating with rectangular, sinusoidal and trapezoidal profile as well as for a holographic grating actually fabricated. From the comparison with the results computed with other methods and with the experimental data, the validity and usefulness of the present method have been confirmed. 21 refs.

**074104 "ANTI-BLAZING" OF GRATINGS.** A general property of diffraction gratings is established numerically: at a certain value of the groove depth a grating supporting only two orders acts like a plane mirror - the efficiency of the non-specular order does not exceed 0.1 percent in a large angular region. This property is shown to be a direct consequence of the reciprocity theorem. (Author abstract). 7 Refs.

Mashev, L. (Bulgarian Acad of Science, Sofia, Bulg); Popov, E. *Opt Commun* v 67 n 5 Aug 1988 p 321-324.

**074105 DIFFRACTION CHARACTERISTICS OF METALLIC REFLECTION GRATINGS.** Plane-wave diffraction by metallic reflection gratings with finite conductivity of arbitrary profile is analysed by a new analytical-numerical technique. The obliquely incident radiation is of linear polarisation with either its fields parallel to the rulings. The solution method is simple, general and numerically efficient. It involves expansion by a Fourier series of the periodic permittivity function in the inhomogeneous grating region, and application of finite differences to numerically solve the inhomogeneous vector-wave equation in this region. Numerical results are presented for several gratings to demonstrate the convergence, reliability and accuracy of the method. They also show effect of the finite conductivity of metal on the diffraction characteristic of gratings. (Author abstract). 12 refs.

**074106 DYNAMICS OF TWO-WAVE MIXING WITH RUNNING GRATINGS IN PHOTOREFRACTIVE CRYSTALS.** In this study we extend previous works of the dynamics of two-wave mixing in photorefractive crystals in respect of two points: (i) We allow different frequencies of the two beams. (ii) We calculate both hologram buildup and erasure, where the writing time may be arbitrary. The introduction of a running grating leads to a complex effective response time  $\tau_{eff}$ . With this the behavior of a drift dominated photorefractive material can be forced upon a diffusion dominated material and vice versa. This effect has been used to enhance the steady state amplification. (Edited author abstract). 5 Refs.

**074109 PICOSECOND PHOTOREFRACTIVE AND FREE-CARRIER TRANSIENT ENERGY TRANSFER IN GAAS AT 1 μm.** The strength, formation, and decay of photorefractive and free-carrier gratings written in GaAs by 43-ps pulses at a wavelength of 1 μm are investigated using picosecond-time-resolved two-beam coupling, transient grating, and degenerate-four-wave-mixing techniques. Photorefractive weak-beam gains of a few percent are measured at fluences of a few pJ/μm<sup>2</sup> (0.1 mJ/cm<sup>2</sup>), and gain from transient energy transfer is observed at fluences larger than 10 mJ/cm<sup>2</sup> in the beam-coupling experiments. The roles of saturation and two-photon absorption in determining the final electron, hole, and ionized-donor populations and the roles of drift and diffusion in determining the quasi-steady-state photorefractive and free-carrier index modulations are discussed. 27 refs.

**Analysis**

**074110 COUPLED BEAM ANALYSIS OF CURVED PLANAR BRAGG GRATINGS.** When a laser or a fiber is butt joined to a single mode film waveguide it launches a two-dimensional nearly Gaussian beam in the fundamental film mode. A curved Bragg grating may deflect and even refocus such an incident Gaussian beam. A coupled beam analysis has shown that the distortions of the refocused field may be kept low if the distance between the beam waists and the curved grating is sufficiently long. The greater this distance, the more the curved grating behaves like a concentrated reflector, which has the same wavelength dependence of reflectivity as would result for a plane wave incident upon a corresponding plane grating with straight lines. (Author abstract) 6 refs.

**Applications** See LASERS, DYE; MECHANICAL VARIABLES MEASUREMENT—Laser Applications.

**Construction**

**074111 INTERFEROMETRIC METHOD FOR MAKING EQUISPACED CIRCULAR GRATINGS.** A simple interferometric method is proposed for constructing equispaced circular gratings. This method uses only a cylindrical mirror and a collimating lens, and the radial spatial frequency of the gratings thus constructed is a function of the focal length of the collimating lens. A change of radial spatial frequency of the grating can be performed by changing the focal length of the collimator. A continuous change of the frequency can be obtained by using a zoom lens. (Author abstract). 9 Refs.

**Design** See Also POLARIMETERS—Design.

**074112 DIFFRACTION BY DYNAMIC GRATINGS INDUCED BY OPTICALLY GENERATED CARRIERS IN InGaAsP.** Dynamic interferometric amplitude gratings are generated in an InGaAsP epitaxial layer of 2 μm thickness. The pump beams have a wavelength of 514 nm and a light power of approximately 0.3 w each. The diameter of the grating pattern amounts to 440 μm. The average pumping intensity is 400 w/cm<sup>2</sup>. A maximum absorption difference in the sample between the bright and dark grating lines of 160cm<sup>-1</sup> is introduced via dynamic band filling. A test beam at 1.30 μm wavelength corre-

sponding to the band gap wavelength of the epilayer is diffracted and thus modulated by the grating at grating constants of about 20  $\mu\text{m}$ . The diffraction efficiency of the first order at normal incidence amounts to about  $1 \times 10^{-4}$ . The 3 db corner frequency of the modulation is about 80 MHz. Carrier diffusion diminishes grating contrast. (Author abstract). 6 Refs.

**074115 FABRICATION OF BLAZED GRATING BY SLOPING V-GROOVE STRUCTURES ON SILICON.**  $\langle 113 \rangle$  oriented silicon is used as substrate and the  $\langle 113 \rangle$  surface is at an angle of  $25.24^\circ$  with  $\langle 111 \rangle$  planes. A 36  $\mu\text{m}$  period diffraction grating as a mark during the anisotropic etching of silicon was generated on  $\langle 113 \rangle$  Si by thermal oxidation and photo-etching technology. Subsequently silicon wafers are etched in the conventional anisotropic etching solution. Continuously slanted V-groove structures on silicon have been fabricated which are used for a 36  $\mu\text{m}$  groove distance blazed grating with 69% diffraction efficiency at wavelength of 6328 Å. Useful blazed gratings can be obtained by further reducing the groove distance. (Author abstract) In Chinese. 3 refs.

**074119 CALCULATION ON THE RESOLUTION AND THE DIFFRACTION INTENSITY OF ONE DIMENSIONAL LINE GRATINGS WITH ABERRATIONS.** The resolution and the diffraction intensity are calculated on the one-dimensional gratings which have positional errors of the lines. Two types of errors are investigated. One is a random error represented by a certain probability distribution. The other is a systematic one which is a function of the line position and can be denoted with a polynomial expression of the line position. As the result it is shown that the random error hardly decreases the resolution, but the systematic error decreases the resolution significantly. It is also shown that in the systematic error case, the scattering energy is localized around the maximum intensity of diffraction so that the product of the maximum value and the width of half maximum of diffraction intensity distribution becomes almost constant. In the random error case, the product is not a constant and the scattering energy diffuses widely along the diffraction angle. (Author abstract) In Japanese. 3 refs.

**074120 NATURAL MODES OF TWO-DIMENSIONAL RECTANGULAR GRATINGS.** The properties of the roots of the dispersion equation for the electromagnetic field of a grating with two-dimensional rectangular sinusoidal modulation are analyzed in the four-wave approximation. The regions of real and imaginary roots and their dependence on the grating periods and modulation amplitudes along both coordinates are determined. It is shown that as one of the modulation amplitudes tends to zero the roots of the dispersion equation change into the roots of the equations of a grating with one-dimensional modulation. The presence of important special features of the roots compared with one-dimensional modulation is pointed out. (Author abstract) 4 refs.

## Theory

**074125 AMBIGUITY FUNCTION AND GENERAL TALBOT-LAU EFFECTS.** The Talbot and Lau effects of Ronchi gratings are treated by the ambiguity function in this paper. Furthermore, both effects fit any optical system. Because of quasi-ray-optical operation of the AF, two general formulas directly describing the patterns of the Talbot and Lau fringes respectively are derived in a quite simple form. All the variables in the formulas depend only on the transfer matrices of the optical system used. The Talbot and Lau effects of complex gratings are also discussed. (Author abstract) In Chinese. 23 refs.

**074129 TOWARD A GENERAL-PURPOSE OPTICAL OSCILLOSCOPE.** For years, researchers and product developers have had to assemble some sort of jury-rigged apparatus to make critical optical measurements with conventional oscilloscopes. All this has changed with the introduction, by Tektronix, of a new oscilloscope capable of measuring optical signals directly. Users can quickly and consistently analyze data from a wide variety of applications, ranging from high-energy physics and nuclear research to high-voltage transmission and communications systems.

Trent, Bill (Tektronix, Beaverton, OR, USA). *Lasers Optonics* v 6 n 12 Dec 1987 p 52-54.

**074130 INSIGHTS ON MOIRE DEFLECTOMETRY.** A phase-measuring interferometer uses the interference phenomenon between two temporally coherent light waves to form a fringe-contour map. Both reflective and phase objects can be tested, and the resulting map is fully quantitative. This technique has long been the most popular method of optical diagnostics, although it suffers four drawbacks that lead to difficult operation and (generally) high-cost instrumentation. Moire deflectometry inherently solves these problems of interferometry and adds many benefits. It is insensitive to tilt, relative height is observed directly, mechanical stability requirements are only ten times the desired sensitivity, and sensitivity is tunable. Deflectometry can be used to test all objects that are tested by interferometry, plus other objects whose distortions are beyond the range of interferometry. A Moire deflectometer maps ray deflections caused by refractive-index gradients in phase objects, or height gradients of reflective surfaces. The technique is based on the Moire effect, a phenomenon that causes a Moire fringe to appear when two gratings are placed at a small angle to each other. 21 Refs.

Aerospace Applications

**074132 PERFORMANCE OF OPTICAL SENSORS IN HYPERSONIC FLIGHT.** Hypersonic flight through the atmosphere presents unique environmental conditions that significantly affect the performance of a vehicular optical sensor. Knowledge of high-speed optical conditions and of the resulting effects on sensor performance is important in the design of optical instruments used in space shuttles, high-speed aircraft, and guided missiles. This article reports on recent work to quantify the transmissive and radiative effects of complex flow and heated windows caused by hypersonic flight in order to predict sensor performance and investigate the effect of film cooling of windows. (Author abstract) 12 refs.

**074135 METHOD OF RECOGNIZING THREE-DIMENSIONAL POSITION OF A RIGID BODY USING ITS SHAPE. ERROR ANALYSIS AND AN OPTIMIZATION OF OBSERVATION SYSTEM.** In the problem of measuring three-dimensional positions and motion of a rigid body, methods to determine the three-dimensional position from its optical projection data

on a two-dimensional plane have been widely used. We have proposed a method using positional relations among the marked points and applied it to three-dimensional movement measurement of the human jaw. This paper analyzes the effect of error associate with measurement on estimating the position of marked points at implementation. Error propagation equations are derived effective for design of measuring instruments. The optimum measuring method is obtained from the viewpoint of error propagation using the result. (Edited author abstract) 8 refs.

Evaluation

**074136 PROFILE OF SIRA LTD.** Previously known as the British Scientific Instrument Research Association, Sira has continued, since its formation in 1918, to offer a service to users and manufacturers of instruments that involves the application of new developments in optics to serve the needs of industry. The two operating divisions provide multidisciplinary teams to work on a variety of different problems, including instrument evaluation and calibration, conference and course organization, and the application of measurement science to solve new industrial problems. Two recent projects described include the use of the principle of thermoelasticity to display the distribution of stress on the surface of a structure subjected to periodic loading, and a TV-imaging technique that enables a surface flaw to be quantified objectively in relation to a standard. (Edited author abstract) 5 refs.

Gratings

**074137 APPROXIMATE ANALYSIS OF DIELECTRIC GRATINGS WITH BOUNDARY REFLECTION.** Approximate two-wave analysis of planar dielectric gratings with boundary reflection is presented. The analysis is derived from our previous rigorous theory by neglecting the higher-order waves and the second derivatives of the field amplitudes but taking into account of the boundary reflection. The pulsation phenomena of the diffraction efficiency due to the multiple reflection which are usually ignored in most of the approximate analysis can be given clearly by simple  $2 \times 2$  matrix calculations for practical gratings of small index-modulation type. The numerical results are given for TE wave incidence and are compared with rigorous results. (Author abstract) 9 refs.

Ionization

**074139 REGISTRATION OF IONIZATION CLUSTERS BY ELECTROLUMINESCENT DRIFT CHAMBER.** The possibility of registration of ionization clusters by a drift chamber with luminous data acquisition is investigated. Light is collected by a reemitter-containing light guide, which views two photomultipliers connected in coincidence. For registration of clusters, a mixture of  $\text{Ar} + 15\% \text{CH}_4$  is blown through the chamber, which operates in the proportional mode. The duration of a

signal from a single electron is 5-7 nsec. The average density of clusters registered from beta particles is 12 or 9.5 cm<sup>-1</sup> for a drift field of 40 or 100 v/cm in transverse-drift geometry for a digitization time of 2 nsec. (Author abstract) 13 refs.

**074141 INJECTION MOUNTING: A LENSE ASSEMBLY INNOVATION.** This article introduces an innovative technique used for mounting lens elements and assembling optical systems which has been developed at Kodak. Known as Injection Mounted Assembly (IMA), this unique process forms a molded cell around an uncentered glass lens element. The molded cell is an optical subassembly with the lens element's optical axis aligned to secondary mounting features that are created during injection molding. 3 refs.

Pollicove, Harvey; Aquilina, Thomas. *Photonics Spectra* v 21 n 12 Dec 1987 p 109-114.

**074142 LENS CORRECTION FOR OPTICAL SYSTEMS.** The range of optical diameter gauges designed and manufactured by Beta Instrument Company Ltd. have been upgraded to include computer generated lens correction routines, giving the gauges an improved accuracy and a greater tolerance to movement of the measured product. In the wire, fibre and extrusion industries, dimensional measurement will often have to be performed by non-contact techniques using optical methods. These methods enable the product size to be determined immediately after the extrusion, so that process control can be applied to maintain the size between strict limits. To gain a high resolution of measurement, laser scanning can be used whereby a thin beam of monochromatic light is passed over the product in a linear scan and is arranged to fall on a photo-cell.

**074145 RECENT APPLICATIONS OF METAL MATRIX COMPOSITES IN PRECISION INSTRUMENTS AND OPTICAL SYSTEMS.** This paper describes three unique metal matrix composite (MMC) material systems that have been developed for use in dimensionally stable platforms, precision mechanical systems, and lightweight reflective optics. These materials, consisting of aluminum alloys reinforced with fine particles of silicon carbide, offer performance advantages over conventional metals, including greater specific stiffness, higher strength, and better resistance to compressive microcreep. Weighing about the same as aluminum, certain grades of these MMC materials are isotropic and have excellent thermal conductivity, and they can be tailored to match the coefficients of thermal expansion of other materials, including beryllium, stainless steel, and electroless nickel. Such flexibilities in establishing material properties and characteristics present new opportunities in producing weight-critical, precision hardware. Practical applications of MMC materials in advanced guidance equipment and lightweight optical assemblies are discussed. (Edited author abstract) 15 refs.

**074150 MICROWAVE ENERGY FLUX DIVIDER OF QUASIOPTICAL TYPE.** An energy flux divider in quasioptical measuring channels performs the function of a separator of the signal from a microwave generator into signals directed to the measuring and heterodyne channels, the adder of these signals in a balanced bolometric mixer, the directional coupler of a reflexometer, splitting in an interferometer. To perform the functions mentioned, the energy flux divider should satisfy a number of requirements, the most important of which are high directivity and controllability of the coefficient of energy flux division in a given 80-180 GHz frequency band. The directivity requirement is satisfied mainly by selecting the construction and quality of fabrication of the divider. Controllability of the division coefficient is realized by constructing the divider in the form of two plane-parallel dielectric plates between which the spacing can be changed smoothly. Questions of material selection and plate thickness and the spacing between them in order to satisfy the mentioned requirement are considered analytically and numerically. 2 refs.

**074155 BBO'S NONLINEAR OPTICAL PHASE-MATCHING PROPERTIES.** Beta barium borate (BBO), a major contributor in the development of the field of nonlinear optics, will find its niche in ultraviolet generation. While efforts to improve the size as well as optical quality are continuing, BBO crystals as large as  $10 \times 10 \times 6 \text{ mm}^3$  are already available. This is adequate for most dye-laser needs. BBO has an impressive performance for the generation of intense UV radiation. BBO may replace all currently used materials including potassium pentaborate, lithium formate, and urea, as well as ADP and KDP, for UV generation in the region from 205 to 360 nm. The usefulness of BBO is enhanced by the low temperature dependence of its index of refraction. Because of this property, laser-induced heating does not significantly affect the conversion efficiency. This results in a significant increase in the stability of the final output and an increase in the ease of alignment of the crystal. 9 refs.

**074156 OPTICAL PROPERTIES OF  $\text{Ce}^{3+}$  IN YTTRIUM GALLIUM GARNET PHOSPHOR.** The diffuse reflection, excitation and fluorescence spectra of  $\text{Ce}^{3+}$  ions in  $\text{Y}_3\text{Ga}_5\text{O}_{12}$  garnet phosphor have been studied and discussed at room temperature for the first time. It has been found that the YGG- $\text{Ce}^{3+}$  shows the optical properties of the allowed 5d-4f transition of  $\text{Ce}^{3+}$  ions whether under UV radiation or visible blue light or cathode ray excitation. The broad emission band extending from 430 to near 670 nm results from the transition of the lowest 5d level to  $^2F_1$  ( $J = 5/2, 7/2$ ) terminal state. In YGG, the optical behaviour of  $\text{Ce}^{3+}$  is very similar to that of  $\text{Ce}^{3+}$  in YAG, but the positions of absorption and emission bands of  $\text{Ce}^{3+}$  shift toward shorter wavelength. (Author abstract) 8 refs. In Chinese.

**074157 PHASE-MATCHED OPTICAL SECOND-HARMONIC GENERATION IN THE ORGANIC CRYSTAL MBA-NP, (—)2-( $\alpha$ -METHYLBENZYLAMINO)-5-NITROPYRIDINE.** Large ( $5 \times 3 \times 3 \text{ cm}^3$ ) crystals of the organic nonlinear optical material MBA-NP have been prepared by growth from solution, in an optically and structurally highly perfect state. Oriented cut and polished specimens were examined by the Maker fringe technique at a wavelength of 1.064  $\mu\text{m}$ . Analysis of the data yielded  $d_{22}$  as  $69 \times d_{11}$  quartz with a corresponding coherence length of 2  $\mu\text{m}$ . A large rotation of the X and Z dielectric axes with wavelength ( $30^\circ$  over 200 nm) was observed. Type I phase-matched second-harmonic generation (SHG) was recorded for the 1.064  $\mu\text{m}$  dielectric axis set and a (010) faced crystal, phase matched SHG was observed for rotation about X to an angle of incidence of  $45^\circ$ . This angle is very sensitive to the correct alignment of dielectric axes and the effect of its misalignment was investigated. (Author abstract) 5 refs.

## Adhesion

**074158 OPTICAL STRESS FORMED IN ADHESION OF OPTICAL COMPONENTS WITH ADHESIVES.** Ultraviolet-curing adhesive is widely used for effective adhesion of optical components. However, the optical stress formed in the adhesion process has an important role in the optical performance of the product. This optical stress was studied in a series of adhesion experiments using epoxy adhesives, ultraviolet-curing adhesives, and modified adhesives, by means of a Fizeau interferometer and a polarizing light microscope. The optical stress formation was governed by adhesive properties, curing conditions, the structure and dimensions of the assembly, and an external thermal effect after curing. **074159 ANALYSIS OF FATIGUE FAILURE OF OPTICAL GLASS FIBRES.** The author has proposed a new modified Weibull distribution function for the analysis of strength data of optical glass fibers. The main

purpose of this letter is to analyze the fatigue failure of optical fibers in terms of this equation along with fracture mechanics theory. There is good agreement between the predicted and measured distributions indicating that fatigue failure of polymer-coated optical glass fibers occurs by slow growth of pre-existing flaws and that fracture mechanics theory together with the proposed distribution function can be used in making fatigue-failure predictions of these materials. 13 refs.

**074160 SURFACE FLAWS IN  $\text{ZrF}_4$ -BASED FLUORIDE OPTICAL FIBRES WITH IMPROVED TENSILE STRENGTH.** Fluoride glass is widely recognized as the most promising material for ultra-low loss optical fibers. This letter reports surface flaw formation in  $\text{ZrF}_4$ -based fluoride fibers. Discussions are based on the effect of preform surface treatment on the tensile strength and fiber surface analysis using electron spin resonance (ESR) measurements. Tensile strengths were uniformly raised to 500 MPa by surface treatment. Based on sub-critical crack growth data in which a growth parameter of 66.5 was obtained, existing flaw sizes were estimated to be around 0.1  $\mu\text{m}$ . In addition, ESR measurement revealed that the fiber surface consists of inherent fluoride. These results suggest that crystalline oxide islands, which act as flaws, are dispersed on the fluoride surface. 8 refs.

**074161 DESIGNING A UNIFIED SET OF TEST GLASSES FOR CHECKING SPHERICAL SURFACES IN OPTICAL COMPONENTS.** It has been proposed to set up a unified (basic) set of glasses and use these in the centralized manufacture and distribution of sets of working glasses for optical manufacturers and other organizations concerned with making optical components having spherical surfaces. An important feature here is that there is no need to make up new pairs of trial glasses, as it is possible to use the best ones available at the organization, which correspond to the first conjugation group in GOST 2786-76, as such pairs can be selected by one's own efforts. When the radii of these have been measured with the highest accuracy (error of measurement not more than 0.005%), they can be used for making working glasses for the industry. Factor relating to implementation of a unified set of glasses for manufacturers are briefly discussed. 1 ref.

Strakun, G.I. *Meas Tech* v 30 n 7 Jul 1987 p 658-659.

**074162 REMOVAL OF GYPSUM AND PORTLAND CEMENT FROM THE SURFACE OF OPTICAL COMPONENTS.** In order to establish the optimum method of removing the residual gypsum mass, a study was made with a number of reagents that can dissolve, soften, or destruct it and facilitate its removal from the surface of the component. The effectiveness of the solution was evaluated on the basis of the time required for removing the gypsum mass and the surface quality of the glass specimen. Superior surface cleaning was obtained when using sodium carbonate with subsequent treatment of the specimen with acetic acid; the best cleaning was achieved under the action of sodium bicarbonate.

## Magnetic Properties

**074164 GALVANOMAGNETIC EFFECTS IN MnSb FILMS.** Materials possessing a large magneto-optic effect and suitable magnetic properties are of great interest for many optical memory applications. In this letter, we report on the galvanomagnetic effects, i.e. transverse magnetoresistance (TMR) and Hall effect in MnSb films in the Thickness range 35 to 400 nm. The galvanomagnetic effects are studied for films deposited at different substrate temperatures. MnSb films were prepared by an electron-beam evaporation, on glass substrates held at different substrate temperatures, and in a vacuum of  $10^{-4}$  Pa. MnSb films exhibit both negative and positive TMR and Hall coefficients, depending on the substrate temperature. 23 refs.

**074165 ASYMPTOTIC REGIME IN THE PROBLEM OF RADIATION TRANSFER IN SPATIALLY BOUNDED MEDIA.** The purpose of this study is to investigate the formation of the asymptotic regime in bounded media, to refine our understanding of the asymptotic regime, and to establish its boundaries. Our consideration will be made on the basis of a method for solving the radiation transfer problem in spatially bounded media [10]. We make a comparative analysis of the asymptotic parameter  $\gamma$  and the function  $K(A, \tau_y, \tau_z, \chi)$ . It is shown that the radiation field in bounded scattering media can be characterized by the function  $K(A, \tau_y, \tau_z, \chi)$ , which is equal to the asymptotic regime parameter for unbounded media. It was found that the rate of decrease in the photometric quantities is greater for smaller transverse dimensions, where a large fraction of the radiation exiting the medium does not take part in the transfer. The transfer of the remaining energy is characterized exponentially. 15 refs.

**074167 OPTICAL BISTABILITY IN PHOTOREFRACTIVE FOUR-WAVE MIXING.** The coupled wave equations for four-wave mixing (FWM) in a cubic, non-optically-active photorefractive crystal are solved for the case of orthogonally polarized pumping beams. For certain values of the pump and probe beam intensity ratios, the solutions exhibit a multi-valued branching behavior. If the different branches are assumed to be stable, bistability of the phase conjugate reflectivity is predicted. Furthermore, it is shown that this solution is valid for the case where the pump beams are parallel-polarized if the geometry of the four-wave mixing configuration is modified slightly. Our results are therefore applica-

ble to crystals of other symmetry groups, such as barium titanate, using the modified FWM configuration. (Author abstract) 4 refs.

## Performance

**074168 QUALITY AND PERFORMANCE OF THE ORGANIC NON-LINEAR OPTICAL MATERIAL (-)-2-( $\alpha$ -METHYLBENZYLAMINO)-5-NITROPYRIDINE (MBA-NP).** Large ( $7 \times 4 \times 4 \text{ cm}^3$ ) crystals of the organic, nonlinear optical material NBA-NP have been prepared by growth from solution, in an optically and structurally highly perfect state. Oriented, cut and polished specimens were examined by the Maker fringe technique. Analysis of the data yielded a coherent length of 2  $\mu\text{m}$  (cf. MNA 0.7  $\mu\text{m}$  and quartz 20  $\mu\text{m}$ ). Type I, phase-matched second harmonic generation (efficiency 0.5% at 58.8 MW  $\text{cm}^{-2}$ ; comparable with lithium iodate) was observed for 1.05  $\mu\text{m}$  radiation incident at 28.8° to the y-axis on the y-z incident plane. There was no evidence of type II phase matching. (Author abstract) 12 refs.

## Plastics Applications

**074170 BRIGHT OUTLOOK FOR OPTICAL POLYMERS.** Optical polymers - basically ultrapure polycarbonates, polyacrylates and polystyrenes - are witnessing a boom in demand, as companies move to exploit their rare qualities (great clarity, excellent processability, high heat-stability) in a range of new products, such as fiber optics, optoelectronic components, and optical disks for storing information. Various investment activities by worldwide companies are covered. Some of the companies are General Electric, Bayer AG, Dow Chemical, and Japanese companies.

## Polishing

**074171 POLISHING OF LITHIUM NIOBATE BY ION-BEAM ETCHING.** Ion-beam etching has previously been used to enable coupling of light from an optical fiber to a titanium indiffused waveguide on  $\text{LiNbO}_3$ . The fiber diameter was reduced so that the fiber could be placed in an ion-etched groove in the  $\text{LiNbO}_3$  coaxial with the waveguide. Here, an alternative use of ion etching, as a non-contact polishing method, is reported. The etching geometry is shown. 2 refs.

## Quartz Applications

**074172 ESR CENTERS IN FUSED QUARTZ EXPOSED TO GLOW-DISCHARGE PLASMAS OF Ar AND  $\text{H}_2$ .** Fused quartz was exposed to glow-discharge plasmas of Ar and  $\text{H}_2$  gases. The ESR centers,  $\text{E}_\text{p}$  and the impurity-associated hyperfine structure (HF) centers were found in the incovered quartz as well as in the quartz covered with a glassplate having an absorption-edge  $\text{E}_\text{c}$  of 150 nm which prevented directed exposure to the plasmas. However, these centers were not found in the quartz covered with a glass-plate having a  $\text{E}_\text{c}$  of 220 nm. Both centers are created predominantly by UV-light of wavelengths between 150 and 220 nm radiated from the plasmas rather than by the plasma particles. It is suggested that the heating effect by the plasma particles on the directly exposed surface enhances the creation of the HF center. (Author abstract). 8 Refs.

## Thin Films

**074176 VACUUM EVAPORATION TECHNOLOGY FOR OPTICAL THIN FILMS.** The general proliferation of high-quality optical instruments in the last two decades has created an increased demand for better thin-film coatings on optical components. This is especially true for those coatings used in laser and aerospace applications. Many of these coatings are applied by

evaporative vacuum deposition. Contaminants of all kinds, including atmospheric, have to be eliminated before and during film deposition to achieve the necessary quality. This requires thorough cleaning of substrates and processing equipment, the use of ultrapure cleaning agents and source materials, and maintenance of highly controlled vacuum conditions, minimizing outgassing and backstreaming.

**074180 VIBRATIONAL CIRCULAR DICHROISM MEASUREMENT IN THE FREQUENCY RANGE OF 800 TO 650  $\text{cm}^{-1}$ .** The development of dispersive instrumentation for the measurement of vibrational circular dichroism (VCD) with a lower frequency limit of approx.  $650 \text{ cm}^{-1}$  is reported. VCD spectra of 3-methylcyclohexanone,  $\alpha$ -pinene, and 3-bromocamphor in the frequency range of 800 to  $650 \text{ cm}^{-1}$  are presented to illustrate instrumental performance. The spectra obtained are superior to earlier spectra obtained with the use of a Fourier transform spectrometer. Significant extension of the lower frequency limit for VCD measurement will require the replacement of the ZnSe PEM by a device whose transmission limit is lower than that of ZnSe and the introduction of yet more powerful light sources. (Edited author abstract) 15 refs.

**074182 DIODE PUMPING OF LNA LASER FOR HELIUM OPTICAL PUMPING.** Neodymium-doped LNA laser crystals ( $\text{La}_{1-x}\text{Nd}_x\text{MgAl}_2\text{O}_9$ ) have been pumped by laser diode arrays emitting around 800 nm. With longitudinal pumping using two 200 mW diode arrays focused on the crystal end, 10 mW of power was obtained at  $1.054 \mu\text{m}$ . With the insertion of a Lyot filter and a thin etalon, tuning across the  $1.082 \mu\text{m}$  band was

possible. Tuning the LNA laser output to the resonance transition of helium-4 ( $2^3\text{S}_1-2^3\text{P}_1$ ) at  $1.083 \mu\text{m}$  enabled us to optically pump the metastable helium atoms in a discharge cell and record magnetic resonance signals. Transverse pumping of the LNA crystals by a high-power, quasi-cw array was also successfully demonstrated. (Author abstract) 17 refs.

**Theory** See Also LASERS—Optical Pumping.

**074184 ANALYSIS OF RAMAN GAIN FOR FOCUSED GAUSSIAN PUMP BEAMS.** Several theoretical and numerical models have been published which describe the evolution of a Stokes beam in a Raman medium excited by a focused pump beam. Generally, the published theoretical departures from the plane-wave theory of Raman scattering are based on assumptions about the power of the pump beam. In this paper we present a theoretical model which is shown to be in excellent agreement with an exact numerical treatment, and which is valid without restrictions on the pump power. Its predictions are used to indicate the range of validity of earlier theories. (Author abstract) 13 refs.

**074186 POLYFOCAL SYSTEMS - METHOD OF MATCHED IMAGES.** The problem of determining N surfaces of an optical system, which provides for aberration-free focusing of the fields of N sources at N foci, is solved. In the first part this method is described by the example of a bifocal system. The method is then generalized to polyfocal systems. The last section illustrates the application of MMI to the construction of a symmetrical trifocal system (two-dimensional problem), providing aberration-free focusing in the directions  $-\alpha, 0, +\alpha$  ( $\alpha=5^\circ$ ). (Edited author abstract) 4 refs.

Vaaz, I.L.; Kimber, B.Ye. *Sov J Commun Technol Electron* v 31 n 12 Dec 1986 p 58-65.

**074187 METHOD FOR PERFORMING N-DIMENSIONAL FOURIER TRANSFORMATIONS IN COHERENT OPTICAL SYSTEMS.** A method for performing N-dimensional Fourier transformation in coherent optical Fourier-transform systems is studied. The method involves a special arrangement of readings of the functions in the entrance and exit planes of the optical system. (Author abstract) 9 refs.

Smirnov, V.V. *Optoelectron Instrum Data Process* n 5 1987 p 26-29.

**074188 SLIT AS SPATIAL FILTER, ITS APPLICATION TO THE ALIGNMENT OF OPTICAL SYSTEMS.** The influence of the size and position of a narrow slit on the intensity distribution produced on a screen by light which passes through an optical system and through the mentioned slit is shown. It is also shown how these distributions may be of use in controlling the alignment of optical systems. (Author abstract). 5 Refs.

Mattei, Guillermo O. (Univ de Buenos Aires, Buenos Aires, Argent); Gil, Mirta A. *Optik (Stuttgart)* v 79 n 3 Jun 1988 p 128-134.

**074189 INFLUENCE OF THE EXTENDED LINEAR INHOMOGENEITIES ON THE STREHL DEFINITION OF THE OPTICAL SYSTEMS CONTAINING PRISMS.** A method is described of calculating the optimal aberration function, the optimal Strehl definition, and parameters of the optimal reference sphere conditioned only by the small extended non-birefringent linear inhomogeneities of the refractive index in prisms. (Edited author abstract). 2 Refs.

Sciarski, Ireneusz (Technical Univ of Wroclaw, Wroclaw, Pol); Ratajczyk, Florian. *Optik (Stuttgart)* v 79 n 4 Jul 1988 p 159-164.

**074190 SPONTANEOUS SPATIAL PATTERN FORMATION IN LASERS AND COOPERATIVE FREQUENCY LOCKING.** We discuss aspects of laser dynamics that are connected with transverse effects. We show that a laser capable of operating simultaneously in more than one transverse mode can develop temporal instabilities and pulsations at gain values close to the lasing threshold and within experimental reach, and also approach steady state configurations in which several transverse resonances develop synchronized oscillation (cooperative frequency locking). We suggest a practical scheme for the experimental verification of our predictions. (Author abstract). 13 Refs.

## Analysis

**074193 DYNAMIC CHARACTERISTICS OF PREDICTIVE ADAPTIVE OPTICAL SYSTEMS.** An adaptive optical system is treated as a linear dynamic system with delay. Using a variety of means for the statistical prediction of random phase distortions, we calculate the errors involved in estimating the mean field and mean intensity in an adaptive optical system with constant time delay. We assess the improvement in correction quality in a system with 'prediction' as compared with a constant-delay system. (Author abstract) 13 refs.

Lukin, V.P. *Sov J Commun Technol Electron* v 32 n 3 Mar 1987 p 49-53.

**074194 PARALLEL N<sup>2</sup> WEIGHTED RECONFIGURABLE NETWORKS FOR OPTICAL NEURON AND CHIP-TO-CHIP INTERCONNECTS.** Various N<sup>2</sup> weighted reconfigurable optical networks for the optical free-space either neural network (ONN) or other chip-to-chip interconnections are proposed. With these new schemes, the large number of either electronic or optical delay lines, that were used in the previous ONN implementations, are minimized, so that the massive interconnections among monolithically integrated either optical neurons or computing chips can be implemented. Both linearly- and circularly-distributed optical neuron (chip) interconnect models are presented. A comparison between the two interconnect models is included. (Edited author abstract). 14 Refs.

## Computer Aided Design

**074196 RECENT TRENDS IN OPTICAL SYSTEMS DESIGN: COMPUTER LENS DESIGN WORKSHOP.** This conference proceedings contains 45 papers. In the first session, Design Philosophy, the general principles involved in optical design are discussed. This topic is expanded on further in Session 2, Special Methods and Theory in Lens Design, where specific techniques for tolerancing and analyzing systems are presented. Session 3, Computer-Aided Lens Design, addresses the contributions made by the use of computers in the design process. The application of artificial intelligence to the design of optical systems is also considered. The next two sessions are oriented more toward applications. The design of telescopes, integrated optical circuits, electronic still video

systems, and anamorphic Fourier transform relays are examined along with many others. In interactive Computer Lens Design Workshop, the latest developments and/or new optical design programs are formally reviewed and demonstrated. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11519 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

## Computer Applications

**074197 ILLUMINATION AND OPTICS FOR AUTOMATIC OPTICAL INSPECTION.** Automatic optical inspection (AOI) systems typically consist of three fundamental parts: the image acquisition module, the segmentation processor and the image analysis processor. With today's demand for increased resolution, accuracy and consistency, the segmentation processor often faces unnecessary burdens brought about by neglect of illumination and transmitter/receiver optics. The price for such design shortcomings is incorrect inspection decisions. This article explores various facets of AOI front ends and shows that object-material properties and inspection-system performance requirements rigidly dictate system architecture - usually to a more complicated degree than lens-and-vidicon combinations.

**Computer Simulation** See Also OPTICAL FILTERS—Mathematical Models.

**074198 SUPER-RESOLUTION USING THE GERCHBERG ALGORITHM.** A modified version of the Gerchberg iterative super-resolution algorithm has been applied in two dimensions to computer simulations of a two point object and a finite portion of its spectrum, and successful extrapolation has been attained. The modified algorithm exhibits a considerably faster rate of convergence, thus overcoming the well known drawback of the original algorithm - the slow and to some extent stagnant convergence. Results are given for both the noise-free case and for the case when signal dependent additive noise is present on the image. (Author abstract). 8 Refs.

Kani, L.M. (Imperial Coll, London, Engl); Dainty, J.C. *Opt Commun* v 68 n 1 Sep 1 1988 p 11-17.

## Control

**074199 NOVEL METHOD FOR ULTRA-FINE CONTROL OF AN OPTICAL PATH.** A novel method for ultra-fine tuning of a Fabry-Perot resonator is shown, in which the evanescent waves existing at the back of a totally-reflecting prism are perturbed by a plate located a few  $\mu\text{m}$  apart. Extremely precise control of the optical path is possible. So that the noise level of the resonance frequency is suppressed to such a low level as that of a stable cavity without control unit. (Author abstract). 5 Refs.

## Economics

**074200 ON THE ECONOMIC TOLERANCE OF OPTICAL SYSTEM.** This paper tries to analyze the economic benefits of an optical system, and to make a

proposal in the estimating and calculating formulae for making optical tolerance with probability-statistical method. In the equations which are used to find the solution of tolerance, the target function is minimum cost, while the restraint conditions are the permitted variation of MTF value and manufacturing ability. Its feasibility is proved by a practical example. (Author abstract) In Chinese.

**Mathematical Models** See Also INFRARED IMAGING; OPTICAL GRATINGS—Theory.

**074202 POLARIZATION INVESTIGATION OF THE RELAXATION OF MEDIUM EXCITATION BY THE METHOD OF DELAY OF ULTRASHORT LIGHT PULSES.** The method is considered to measure the relaxation parameters of optically oriented resonant systems by the polarization change of ultrashort probe pulses. It is shown that in the general case the change of the probe pulse polarization does not occur in exponential dependence of the excitation relaxation. It is seen that the law of decrease of change of the probe pulse polarization in accordance with time delay is exponential too, when the medium is sufficiently thin and rare. (Author abstract) 11 refs.

**074203 DISSIPATION IN MIXED OPTICAL BISTABLE SYSTEMS.** The dissipation problem of a mixed (absorptive and dispersive) optical bistable system (MOBS) is discussed in detail. The main results are as follows: (i) A general rule describing the energy dissipation of the atom-field coupled open systems is derived from the rate equations of the populations of two-level atoms, and it is proved that the energy dissipation of MOBS associated with active atoms in stationary states obeys strictly the above general rule. (ii) The entropy production rate of MOBS is derived from the fundamental principle of the non-equilibrium thermodynamics. (Author abstract) 6 refs.

**074204 LENSLESS DISPLAY OF PHASE-SPACE FUNCTIONS FOR 1-D SIGNALS.** A coherent lensless processor for displaying a 1-D Fourier transform is proposed. It is shown that under appropriate conditions the diffraction produced by certain 2-D objects can be approximated to a 1-D Fourier transformer. In particular we show that this processor is useful in order to display phase-space functions of 1-D signals, which involves in their definitions a 1-D Fourier transform, like the Wigner distribution function, ambiguity function, and local spectrum. (Author abstract) 15 refs.

## Measurements

**074206 MEASUREMENTS OF THE PHASE DISPERSION OF OPTICAL COMPONENTS BY HETERODYNE INTERFEROMETRY.** We describe the use of a heterodyne Michelson interferometer to measure the wavelength-dependent phase shift of a Gires-Tournois interferometer. A comparison of the experimental and the calculated phase characteristics reveals significant deviations indicating, in particular, a different group velocity dispersion of the device under test. The results show that the heterodyne interferometer in combination with a tunable laser is well for the measurement of the phase characteristic of optical components. (Author abstract) 10 refs.

**074207 DISSIPATIVITY OF AN OPTICAL CHAOTIC SYSTEM CHARACTERIZED VIA GENERALIZED MULTISTABILITY.** We present experimental evidence of three different kinds of collisions in a laser with modulated losses and we show that the existence of them is related to the relative overlap of coexisting attractors in the parameter space. The generalized multistability is a quantitative indicator of the dissipativity of a dynamical system and we use it to determine the behavior of the dissipation as a function of the parameters. (Author abstract) 12 refs.

## Monitoring

**074208 ENGINEERING APPLICATIONS OF OPTICAL MULTIPARAMETER MONITORING FACILITIES.** There have recently been papers on optimizing parameter monitoring sequences. There is an optimum approach that minimizes the monitoring time on account of the different rejection probabilities and different parameter monitoring times. Multiparameter monitoring is also important in testing components under conditions of varying atmospheric pressure, temperature, or static and dynamic loading. The mass multidimensional monitoring facility (MMF) is given to a device for rapid size-set monitoring. We consider only facilities that have the most numerous functions and the highest throughput. 23 refs.

Birnirk, Yu.I. *Meas Tech* v 30 n 9 Sep 1987 p 863-867.

## Optical Properties

**074209 NONCRITICAL SLOWING DOWN IN OPTICAL BISTABILITY.** We have experimentally studied by dynamics of a bistable system prepared in an initial state, close to the unstable intermediate branch of the bistability curve but far from the turning points. Our observations are indicative of a divergence of the switching times in  $-\log \epsilon$ , characterizing the departure of the initial state from the unstable branch. This result, contrasting with the  $\epsilon^{-1/2}$  standard law in critical slowing down, is well interpreted by a simple model involving a single dynamical variable. (Author abstract) 17 refs.

## Optimization

**074210 STUDY ON THE OPTIMIZATION OF APERTURES IN AN ABERRATED PROBE FORMING SYSTEM.** The effects of aperture size on the maximum resolving power of a probe forming system have been studied carefully in terms of the optical transfer function. It is found that for a system which has significant chromatic aberration and small spherical aberration, we can achieve a better resolving power than the one given by simple optimization by using slightly larger apertures. However, for a system suffering only from spherical aberration, the gain in the resolving power is marginal by using larger apertures. This result could be of value in the design of low voltage probe forming systems, especially in a low voltage SEM. (Author abstract). 13 Refs.

**074215 HIGH-QUALITY CLEAVES FOR BETTER FIBER SPLICES.** A good fiber cleave is one that produces a completely flat end with an angle (between the cleaved plane and a plane perpendicular to the fiber axis) of less than one degree. A useful tool in the evaluation of cleave quality is the interference microscope which provides a view of the patterns that reveal the contours of the fiber. A perfectly flat cleave that nonetheless has an end angle greater than zero will display a series of parallel fringes. Curved fringes or nonparallel fringes show that the surface is nonplanar. An interference pattern alone will not differentiate between roll-off and lip. Pertinent measurement techniques are discussed.

Johnson, Keith. *Photonics Spectra* v 21 n 10 Oct 1987 5p between p 135 and 142.

**074216 APPARATUS FOR CALIBRATION TESTING OF MEANS OF AVERAGE LASER EMISSION POWER MEASUREMENTS.** The apparatus for calibration testing of average power means of measurements (ACTAP) is designed for transferring the dimension of the unit of the average laser emission power from the standard means of measurement (SMM) to the operational means of measurement (OMM) in accordance with the State Standard GOST 8.275-78. The main metrological characteristic of the ACTAP is the error with which the average laser emission power at the OMM input can be measured. This error consists of the error of the SMM used on the ACTAP, the diffraction divider error, and the error caused by the emission instability. This paper discusses the components of the ACTAP error. These components are SMM errors, diffraction divider error, and laser emission power instability error. 3 refs.

**074221 RADIUS-OF-CURVATURE METER FOR REFLECTING SURFACES.** Curvature is determined by the change of direction of a laser beam reflected by the surface being measured as it moves perpendicular to the beam. The measurement error is  $\pm 1\%$  for a radius of curvature of not over 30 m. (Author abstract) 5 refs.

Gromov, A.N. (Acad of Sciences of the USSR, Novosibirsk, USSR); Schulyat'ev, V.B. *Instrum Exp Tech* v 30 n 2 pt 2 Mar-Apr 1987 p 489-490.

**074222 REGULARIZATION IN ELLIPSOmetry. NEAR-SURFACE DEPTH PROFILES OF THE REFRACTIVE INDEX.** The continuous variation of the refractive index with the depth in the vicinity of surfaces can be determined by ellipsometry without destroying the object of measurements. The presented method does not impress any given structure to the profile and is applicable to just the range of layer thicknesses interesting to optics (about  $\lambda/4$  to  $\lambda/2$ ). The theoretical approach to interpret the measured data leads to an integral equation that is numerically inverted by regularization to filter out the destabilizing effects of measurement errors. The regularizing operator and regularization parameter responsible for this 'filtering' are founded on physical arguments and experiment, respectively. These results can be transferred to other regularization problems based on quantities related to volume (e.g. density, temperature). (Author abstract) 16 refs.

## Applications

**074224 DEFORMATION MEASUREMENT USING HIGH RESOLUTION MOIRE PHOTOGRAPHY.** By installing a slotted mask inside the lens of a 35 mm camera the response can be tuned to resolve 300 lines/mm. The camera is used to record changes in fine grid patterns applied to engineering structures and by analyzing the processed negatives in a spatial filtering system, moire fringe maps are generated representing the separate x and y displacements that have occurred. Measurements have been obtained from materials ranging from concrete to soft plastics and a variety of patterns is described for treating most surfaces. (Edited author abstract). 11 Refs.

## Industrial Applications

**074225 APPLICATIONS OF MOIRE TOPOGRAPHY MEASUREMENT METHODS IN INDUSTRY.** Moire topography is able to determine the shape of an object, by pattern measuring, in a short time. Recently moire topography has been used in various industrial fields because it has superior features that point measurement does not have. As it becomes popular, various related techniques that fit specific needs have been developed and there is the prospect that moire topography will become a more important measurement method and strengthen its position in the near future. This paper explains the grid irradiation method and the grid projection method as the basis of the moire topography measurement method and describes the existing status and prospects of utilizing moire topography measurement in the applied fields of shape measurement, flatness measurement and detection of abnormality. (Author abstract). 13 Refs.

Laser Applications See Also CARBON DIOXIDE—Optical Properties; OPTICAL FIBERS—Measurements.

**074226 AUTOMATIC ANALYSIS OF YOUNG'S FRINGES IN SPECKLE PHOTOGRAPHY AND PARTICLE-IMAGE VELOCIMETRY.** Laser-speckle photography (LSP) and particle-image velocimetry (PIV) are two related optical techniques for the measurement of two-dimensional in-plane displacement. LSP is primarily used for the measurement of solid-surface motion, whereas PIV is used in fluid-flow applications. In both cases, data are obtained from the optical-power spectrum of a double-exposure recording of the moving object by measuring the wavelength and orientation of Young's-type fringes corresponding to the displacement magnitude and direction, respectively. Typically, in any

single experiment, of the order of  $10^4$  fringe patterns must be analyzed, and this would be tedious to perform manually. A number of schemes have been reported in the literature for automated analysis of Young's fringes. We examine two techniques, 1-D integration and 2-D autocorrelation, and discuss their application to LSP and PIV. A unified theoretical model is used to show important differences between the two techniques, and resulting implications with respect to analysis procedures are discussed. (Edited author abstract) 16 refs.

**Mathematical Models** See LIGHT—Scattering.

**Nondestructive Examination**

**074229 NON-DESTRUCTIVE TESTING.** Since they are inherently noncontact, optical test methods are nondestructive and interferometry has become one of the most widely used of such methods. Fringe observation and analysis, however, are highly subjective: Digitization of fringe centers, while providing accuracy to about one-tenth of a wave, is time consuming and not accurate enough to meet demanding testing requirements. It is pointed out that by more precisely measuring the fringe patterns, much higher accuracy can be achieved.

Mittelstaedt, Mark. *Photonics Spectra* v 21 n 10 Oct 1987 7p between p 121 and 132.

**Performance**

**074230 DIFFERENTIAL INTERFERENCE CONTRAST SYSTEM INCORPORATING A MURTY INTERFEROMETER AND HOLOGRAPHIC CORRECTION.** The Differential Interference Contrast (DIC) method, is useful for the observation of phase gradients in objects which have phase variations of less than one quarter of a wavelength. A description of an optical system in which the DIC method is realised through the use of a Murty-type shearing interferometer consisting of a plane parallel glass plate is given. This is followed by a description of a modified version of this system, in which a holographic element is used to compensate for lens aberrations, and to modulate the output fringes in order to allow their easy detection. The application of this system to the measurement of film thickness is described. Results are given which are in reasonably good agreement with measurement made on a Talysurf. (Edited author abstract) 6 refs.

**Spectroscopic Analysis**

**074231 DEVELOPMENT OF A HIGH-SPEED TIME-RESOLVED SPECTROSCOPE AND ITS APPLICATION TO ANALYSIS OF TIME-VARYING OPTICAL SPECTRA.** The authors have developed a spectroscopic measuring system that is controlled by a microcomputer to analyze a time-varying optical spectrum. A charge-coupled-device (CCD) linear image sensor, which has 128 pixels, is used as an optical detector, so that the optical spectrum can be measured quickly in a parallel way. The spectrum to be measured ranges from about 350 to 700 nm in wavelength. All data are digitized and transferred to a microcomputer for storage on a floppy disk, and they can be processed for display in various forms. This system has been applied to the spectrum analysis of light emitted due to a contact arc discharge. 5 refs.

**074232 BISTABILITE, MULTISTABILITE ET CHAOS EN LONGUEUR D'ONDE.** [Bistability, Multistability and Chaos in Wavelength]. Unstable and chaotic phenomena have led to a number of studies in the area of optics which allows easy experimental verifications owing to the use of optical sources and feedback, and optically-induced nonlinearities. Most of those studies have dealt with hybrid or all-optical systems working in monochromatic light and whose dynamic variable of concern was the energy. The work presented here deals with chaotic phenomena linked to the wavelength variable. The latter opens up new possibilities inherent to the high flexibility in inducing wavelength nonlinearities and their control, and to the greater dynamic excursion of the signals. Wavelength bistable and multistable devices are presented, together with a discussion of the various routes to chaos they can generate. The prospects given in the conclusion deal with the use of the wavelength variable in a chaos generator, the multi-valued coding in wavelength of signals, and the chaos that would be generated by a system with a feedback featuring a signal-dependent optical delay. In French. 14 refs.

**Absorption**

**074235 BAND TAILS, PATH INTEGRALS, INSTANTONS, POLARONS, AND ALL THAT.** This paper reviews the explanations recently developed by the authors and their collaborators of how disorder leads to exponential band tails and to Urbach tails in optical absorption. It starts with the simplest single-potential-well models which, despite their simplicity, are remarkably successful in accounting for the experimental facts. It then identifies the weaknesses, hidden or explicit, in these models and shows, step by step, how they can be corrected by increasing the sophistication of the procedures used. Exact results are finally achieved through use of field-theoretic techniques, and appropriately formulated single-potential-well models are shown to reproduce these quite accurately. It is also shown that the probability distribution of the random potential must be close to Gaussian, with an autocorrelation function which cuts off fairly rapidly with distance for there to be a well-defined, broad energy range in which there are exponential band tails in the density of states and Urbach tails in the optical absorption. (Author abstract)

**074239 REFINED HEURISTIC CRITERIA FOR THE APPLICABILITY OF GEOMETRICAL OPTICS.** The heuristic criteria for the applicability of geometrical optics extend the results of numerous investigations, beginning with the classical investigations of Fresnel. The first (basic) requirement reduces to the fact that within the limits of the first Fresnel zone the variations of the parameters of the wave and medium would be quite small. It is advisable to refine the Fresnel zone concept in order to avoid an erroneous interpretation of the heuristic criteria in the case of saddle-type stationary points. The second (or auxiliary) criterion of the applicability of geometrical optics - the beams must not cross the Fresnel volumes - also needs to be refined: this condition must refer only to Fresnel zones belonging to one and the same phase front, i.e., the beams must belong to one and the same congruency. This follows directly from the meaning of the stationary phase method, by means of which the geometrical optics approximation can be derived on the basis of the Kirchhoff integral. 12 refs.

**074240 SYMMETRY AND GEOMETRICAL RELATIONS DERIVED FROM REAL AND COMPLEX ABCD LAW FOR GAUSSIAN BEAMS.** The symmetry of the complex radius of curvature is analyzed, and a definition for the local divergence of the gaussian beam is given also. By the use of the ABCD law we deduce expressions for the conjugate point distances, matching beam waist problem and lateral magnification, including new definitions for the angular and axial magnification. An extension of the ABCD law is given including complex matrix elements, and an application on lenslike media with loss or gain variation is made as a characteristic example. (Edited author abstract). 7 Refs.

**074243 MEASURING THE PHASE OF SLOW KERR-TYPE NONLINEARITIES: THE ROLE OF PHASE MODULATION.** We show theoretically and verify experimentally how the phase modulation of the laser pulse affects the phase of the various contributions to the nonlinear polarization in the optical phase conjugation geometry. This provides an explanation for the apparent sum rule violation observed by Jain and Lind in semiconductor-doped glasses. It also allows to define the conditions which must be fulfilled when one wants to measure the phase of a slow Kerr-type nonlinearity. (Author abstract) 12 refs.

**074245 COMPUTATION OF THE OPTICAL PROPERTIES AND THEIR FIRST ORDER DERIVATIVES FOR MULTILAYER STRUCTURES.** An elaborate computer program has been established for calculating the optical properties and their first order derivatives for arbitrary multilayer structure systems. The method employs Chebyshev polynomials. The optical properties that may be calculated include reflectivity R, transmissivity T, absorptivity A and their derivatives R', T' and A' with respect to wavelength. The advantages of the present program reside in the reduction of the computer time by almost a factor of m, the total number of inentity periods, and the advantage of calculating the derivatives of R, T and A with respect to wavelength. The basic formulas which are utilized in these calculations are given together with the essential details of the program, including a block diagram. (Edited author abstract) 13 refs.

**074246 OPTICAL QUANTUM NONDEMOLITION DETECTION SCHEMES IN  $\chi^{(2)}$  MEDIA.** Two quantum nondemolition (QND) measurement schemes using second order optical nonlinearities are proposed and shown to fulfil the criteria for back-action evasion in a measurement of optical amplitude. The first scheme, based on optical rectification, is very simple in principle, but yields extremely small signals with available materials. The second scheme is based on optical parametric amplification with type II phase matching. The interactions necessary for back-action evasion are provided by polarization mixing using Faraday rotation. (Author abstract) 18 refs.

**074248 MOIRE FRINGE MULTIPLICATION OF SUPERIMPOSED GRATINGS IN COHERENT FILTERING SYSTEM.** In this paper the principle of Fourier optics is used in treating the problem of moire fringe multiplication formed by two contact gratings. A continuous relationship between displacement and light intensity is obtained. The gratings may be amplitude type, phase type, or amplitude and phase type. Moire fringe multiplication under coherent illumination for both homogeneous and inhomogeneous deformation-field is considered. The resulting formulas have universal significance and agree fairly well with the experimental results obtained by D. Post. (Author abstract) In Chinese 9 refs.

**074252 CHAOS DANS DES SYSTEMES OPTIQUES A REACTION RETARDEE.** [Chaos in Delayed Feedback Optical Systems]. Optical systems which display bistability in the stationary regime may exhibit high-dimensional chaos. The Lyapunov dimension of chaotic attractors is found to be almost equal to the delay time divided by the autocorrelation time of the feedback for two optical systems, the nonlinear ring cavity and the hybrid system, and for the Mackey-Glass model for white-cell production. This simple relationship will enable experimentalists to easily estimate the complexity of a high-dimension system. (Author abstract) In French. 11 refs.

**074254 SURFACE-GUIDED NONLINEAR TM WAVES IN PLANAR WAVEGUIDES.** The propagation of strongly nonlinear TM surface-guided waves in media controlled by a self-focusing third-order optical, unsaturated nonlinearity is analysed theoretically. In this theory both the amplitude and the wave number of the guided wave are power dependent. The reasons for studying these waves are explained and it is emphasised that strong nonlinearity can lead to a number of device applications. Although such devices are not simulated here, a number of planar structures that are of potential device interest are discussed. A mathematical theory is presented that is both free of previous approximations and capable of dealing with many types of nonlinear mechanisms. The waveguide structures that are considered are a single interface between semi-infinite linear and nonlinear media, a linear guide symmetrically bounded by self-focusing nonlinear media and two linear waveguides coupled through a nonlinear medium. The exact theory quickly leads to equations that can only be solved numerically but some degree of analytical progress is reported here for the single-interface case. Two methods of solution are presented, one based on the first integral of the nonlinear wave equation and the other based on a spline collocation numerical method. (Edited author abstract) 31 refs.

**074256 NONLINEAR OPTICAL PHASE CONJUGATION.** The real-time information processing and manipulation of electromagnetic waves using nonlinear optical techniques has results in a myriad of new insights and applications in diverse fields such as quantum electronics, real-time adaptive optics, image processing and optical computing. The field had also motivated basic study in such areas as nonlinear laser spectroscopy, coherent and quantum optical motivated basic study in such areas as nonlinear laser spectroscopy, coherent and quantum optical phenomena, and in essence, has unified many classes of nonlinear optical interactions, occurring in most natural and synthesized states of matter. In this chapter, we review and explore the field, provide a historical perspective, analyze several of the nonlinear interactions useful for the generation of phase-conjugate replies, and conclude with a brief survey of potential applications and suitable nonlinear media. **074257 ENHANCEMENT OF PHASE CONJUGATION BY STIMULATED BRILLOUIN SCATTERING IN FLOWING AND NON-FLOWING GASES.** A theoretical analysis of optical phase conjugation (PC) in four-wave mixing is made for gases in which the driving force is proportional to the gradient of the square of the electric field. The enhancement mechanism for PC in nearly degenerate four-wave mixing (NDFWM) by Stimulated Brillouin Scattering (SBS) is treated, in the present work, by making the analysis for degenerate four-wave mixing (DFWM) in a flowing fluid, at nearly sonic velocity, and transforming the equations to the fluid frame of reference. The equations derived in the present work give a relation between the frequency shifts of the pump and the probe fields which would give maximal enhancement of PC. (Author abstract) 19 refs.

**074258 WEHRL'S ENTROPY AS A MEASURE OF SQUEEZING.** In quantum optics, the most important quantum states are the coherent states first introduced by Schroedinger in 1926. For more than a decade, people have speculated about the possibility of generating radiation with the uncertainty in one quadrature component reduced below the symmetrical lower limit set by the coherent state. This of course can only be achieved at the expense of increased uncertainty in the other quadrature component so that the Heisenberg Principle is not violated. The quantum states of this kind of unusual radiation field are called squeezed states. In this paper Wehrl's entropy is adopted to be a measure of uncertainties of quantum states and used to characterize the degree of squeezing of squeezed states in quantum optics. **074259 PICOSECOND INFRARED GENERATION FROM Nd:YAG AND A VISIBLE, SHORT CAVITY DYE LASER.** We report infrared conversion of picosecond, visible dye laser pulses and picosecond 1.064  $\mu\text{m}$  by a sequence of difference frequency generations in  $\text{LiIO}_3$  and  $\text{AgGaS}_2$  crystals. The dye laser was a short cavity design and was pumped by the second harmonic of a mode-locked Nd:YAG laser to give 23 ps pulses. The design can span 4-11  $\mu\text{m}$  in the infrared, and we tested the efficiencies between 5.2-6.4  $\mu\text{m}$  with a single dye. Conversion efficiencies of the dye laser were 16%, while the

resulting near infrared was converted to infrared at 35% efficiency. (Author abstract) 20 refs.

**074261 COMMENT ON NONLINEAR OPTICS USING SURFACE PLASMON-POLARITONS.** Theories of nonlinear effects associated with the surface plasmon-polariton (SPP) mode have centered on the enhanced electric field localized at the metal/dielectric interface. Although SPPs do indeed present potentially large field enhancements without the need for a Fabry-Perot resonator, the primary nonlinear effect will almost invariably be thermally induced. Unlike a resonant cavity arrangement, the SPP resonance is a resonant absorption of the incident power into Joule heating of the metal. (Author abstract) 10 refs.

**074263 FORCED OSCILLATION MODEL OF OPTICAL BISTABILITY.** This paper presents a new model of optical bistability (OB). In view of the ideas of the mean field approximation, the slow envelope approximation and the adiabatic approximation, the OB system can be regarded as a 'box'. Compared with the theory of nonlinear oscillation, we find that the courses in different OBS's - including different substances and different cavities (E-P.C. or R.C.) - can be described consistently, in both steady state and temporal respect, with an appropriate nonlinear forced oscillation equation, in which the coefficients are measurable macroscopic parameters. Using the method of slowly changing phase and amplitude in oscillation theory, we develop the equation into a coupling and autonomous dynamic equation set of phase and amplitude. The general solutions of the equation set for OB steady state and transient behavior are obtained conveniently from this form. Several concrete results in literature are compared as the examples for the verification of the wide applicability of this model. (Author abstract) In Chinese. 6 refs.

**074271 PHOTOCONDUCTIVE ENHANCEMENT OF DEGENERATE FOUR-WAVE MIXING REFLECTIVITY IN BSO.** A method of enhancing the degenerate four-wave mixing (DFWM) conjugate reflectivity in photorefractive BSO is described, which uses an auxiliary beam of different wavelength to modify the local conductivity inside the crystal. With an applied external electric field of 6 kV cm<sup>-1</sup>, and small diameter DFWM beams, the auxiliary enhancing beam is used to increase local conductivity and hence drop essentially the entire voltage across the small DFWM region producing local fields of approx. 30 kV cm<sup>-1</sup>. A simple model is derived for three separate experimental configurations, and the predictions are compared with experimental results using yellow and blue beams for DFWM and enhancing beams respectively. **074272 MAGNETIC FIELD GRADIENTS AND PARTICLE DENSITY EFFECTS IN SECOND-HARMONIC GENERATION IN SODIUM VAPOUR.** A single-frequency c.w. dyelaser has been used to study the properties of second-harmonic generation in sodium vapor induced by a magnetic field. Theoretical modeling shows that the phase as well as the magnitude of the generated second harmonic depends on the magnetic field strength. By using an appropriate magnetic field gradient it is thus possible to reduce the effects of phase-velocity mismatching, and this has been demonstrated experimentally. The effects of buffer gas pressure on second-harmonic generation have also been studied. (Author abstract) 11 refs.

**074274 BERRY'S PHASE IN THE COHERENT EXCITATION OF ATOMS.** The adiabatic variation of a Hamiltonian can cause the wavefunction, governed by the Hamiltonian, to acquire an unexpected phase. The existence of this phase (Berry's phase) is an additional element in the well-known quantum adiabatic theorem. Berry's phase is observable in the interference between two identically prepared systems only one of which is adiabatically varied. We show that a single quantum system prepared in a superposition of the eigenstates of its Hamiltonian leads to observable Berry phase effects at all times. We examine this principle within the context of two-level optical resonance. (Author abstract) 31 refs.

## Synthesis

**074276 OBSERVATION OF OPTICAL REDSHIFTS AND BLUESHIFTS PRODUCED BY SOURCE CORRELATIONS.** Frequency shifts of the optical spectra emitted by a pair of suitably correlated small sources have been recently predicted by E. Wolf and demonstrated experimentally in the acoustic domain by Bocko, Douglass and Knox. We show that a small modification in the form of the correlation functions used by Wolf leads to a model of the correlated pair that can be synthesized in the optical domain. The results of experimental tests exhibiting redshifts and blueshifts are presented. (Edited author abstract) 9 refs.

**074277 LOCAL FREQUENCY DESCRIPTION OF OPTICAL SIGNALS AND SYSTEMS.** Two types of local frequency spectra are presented: the Wigner distribution function and the sliding-window spectrum; the latter function is the Fourier transform of the signal after having been multiplied by a slided window function. The Wigner distribution function can provide a link between Fourier optics and geometrical optics. The sliding-window spectrum leads to Gabor's expansion of a signal into a discrete set of properly shifted and modulated versions of an elementary signal; the latter description leads, by its discrete nature, directly to the concept of the number of degrees of freedom of a signal. Applications of Gabor's expansion to optical signals (completely coherent and

partially coherent) as well as a way to generate Gabor's expansion coefficients of a time signal by optical means, are described. (Edited author abstract) 113 refs.

**074280 SEQUENTIAL STOPPING RULES FOR THE MULTISTART ALGORITHM IN GLOBAL OPTIMIZATION.** In this paper a sequential stopping rule is developed for the Multistart algorithm. A statistical model for the values of the observed local maxima of an objective function is introduced in the framework of Bayesian non-parametric statistics. A suitable a-priori distribution is proposed which is general enough and which leads to computationally manageable expressions for the a-posteriori distribution. Sequential stopping rules of the k-step look-ahead kind are then explicitly derived, and their numerical effectiveness compared. (Author abstract) 12 refs.

**074281 SECOND ORDER NECESSARY AND SUFFICIENT CONDITIONS FOR CONVEX COMPOSITE NDO.** The author considers a minimization problem that arises in nondifferentiable optimization. This problem model has a wide range of application in mathematical programming since many important problem classes can be cast within its framework, e.g. convex inclusions, minimax problems, and penalty methods for constrained optimization. In the present work we extend the second-order theory developed by A.D. Ioffe to arbitrary finite valued convex functions. A discussion of the second order regularity conditions is given that illuminates their essentially geometric nature. (Edited author abstract) 23 refs.

**074282 RELAXATION METHODS FOR PROBLEMS WITH STRICTLY CONVEX SEPARABLE COSTS AND LINEAR CONSTRAINTS.** We consider the minimization problem with strictly convex, possibly nondifferentiable, separable cost and linear constraints. The dual of this problem is an unconstrained minimization problem with differentiable cost which is well suited for solution by parallel methods based on Gauss-Seidel relaxation. We show that these methods yield the optimal primal solution and, under additional assumptions, an optimal dual solution. To do this it is necessary to extend the classical Gauss-Seidel convergence results because the dual cost may not be strictly convex, and may have unbounded level sets. (Author abstract) 16 refs.

**074283 TRUST REGION ALGORITHM FOR NONLINEARLY CONSTRAINED OPTIMIZATION.** We present a trust region-based method for the general nonlinearly equality constrained optimization problem. The method works by iteratively minimizing a

quadratic model of the Lagrangian subject to a possibly relaxed linearization of the problem constraints and a trust region constraint. The model minimization may be done approximately with a dogleg-type approach. We show that this method is globally convergent even if singular or indefinite Hessian approximations are made. A second-order correction step that brings the iterates closer to the feasible set is described. (Edited author abstract) 15 refs.

**074284 GLOBAL CONVERGENCE OF A CLASS OF QUASI-NEWTON METHODS ON CONVEX PROBLEMS.** We study the global convergence properties of the restricted Broyden class of quasi-Newton methods, when applied to a convex objective function. We assume that the line search satisfies a standard sufficient decrease condition and that the initial Hessian approximation is any positive definite matrix. We show global and superlinear convergence for this class of methods, except for DFP. The analysis gives us insight into the properties of these algorithms; in particular it shows that DFP lacks a very desirable self-correcting property possessed by BFGS. (Edited author abstract) 19 refs.

**074285 EFFICIENCY OF A GLOBAL OPTIMIZATION ALGORITHM.** An algorithm for determining the global minimum of an unconstrained function  $f$  is considered. The method is applicable to functions  $f$  having so-called inclusion functions. Such inclusion functions are easily found using some simple features of interval arithmetic. Sharp estimates for the convergence order are presented. The order depends polynomially on the size of the domain of  $f$  and exponentially on the order of the inclusion function chosen and the dimension of the problem. (Edited author abstract) 19 refs.

**074286 USE OF PSEUDO-POLYNOMIAL ALGORITHMS FOR SOME PROBLEMS OF COMBINATORIAL OPTIMIZATION WITH CONSTRAINTS.** There are algorithms for the solution of problems of finding assignments, pair-combinations, or extremal-weight trees, and their operation time is polynomial with respect to the dimensionality of the problem and the length of the binary representation of its numerical parameters. If extremality is replaced in these problems by the requirement of finding a solution of given weight, then the problem become NP-complete, though not in the strong sense. Algorithms for finding solutions of given weight, which are polynomial in dimensionality and magnitude of the numerical parameters, are described. They are probabilistic and, when repeated, yield a solution to the indicated problems which has an arbitrary degree of reliability. (Author abstract) 2 refs.

**074288 HOW GOOD ARE THE PROXIMAL POINT ALGORITHMS?** We consider a simple idealized proximal point algorithm using gradient minimization on  $C^2$  convex functions. This is compared to the direct use of

the same gradient method with an appropriate mollifier. Our object is to assess the potential efficiency of these algorithms. We find that for distant starting values, proximal point algorithms are considerably less laborious than a direct method. However there is no essential improvement in the complexity, only in the numerical factors. This negative conclusion holds for the entire family of proximal point algorithms based on the gradient methods of this paper. The algorithms considered may be important for large scale optimization problems. (Edited author abstract) 6 refs.

**074289 STRUCTURAL ANALYSIS OF LOCAL SEARCH HEURISTICS IN COMBINATORIAL OPTIMIZATION.** Neighborhood, or local, search is a popular and practical heuristic for many combinatorial optimization problems. We examine the neighborhood structures of two classes of problems, 0-1 integer programming and the mean tardiness job sequencing problem - from the viewpoint of state-space graphs in artificial intelligence. Such analysis is shown to provide fundamental insights into the nature of local search algorithms, and provides a useful framework for evaluating and comparing such heuristics. Computational results are presented to support these observations. (Author abstract) 15 refs.

**074290 OPTIMAL PORTFOLIO AND CONSUMPTION DECISIONS FOR A 'SMALL INVESTOR' ON A FINITE HORIZON.** A general consumption/investment problem is considered for an agent whose actions cannot affect the market prices, and who strives to maximize total expected discounted utility of both consumption and terminal wealth. Under very general conditions on the nature of the market model and on the utility functions of the agent, it is shown how to approach the above problem by considering separately the two more elementary ones of maximizing utility of consumption only and of maximizing utility of terminal wealth only, and then appropriately composing them. The optimal consumption and wealth processes are obtained quite explicitly. In the case of a market model with constant coefficients, the optimal portfolio and consumption rules are derived very explicitly in feedback form (on the current level of wealth). (Author abstract) 14 refs.

**074291 INFINITE HORIZON OPTIMIZATION FOR FINITE STATE MARKOV CHAIN.** We consider the infinite horizon optimal control of a finite state Markov chain from the point of view of overtaking optimality and the long-run average cost. The stochastic model is cast into a deterministic framework by considering the distribution of the original state as a new state. Using known results about deterministic control systems we obtain short proofs of existence and characterization of stationary overtaking optimal strategies for the stochastic problem. We characterize and prove existence of stationary strategies which have a minimal cost growth rate in the class of all nonanticipative strategies. Restricting our attention only to stationary strategies we show that for every given initial state there exists an overtaking optimal strategy. Finally, under more restrictive conditions, we establish the existence of a stationary overtaking optimal strategy for all the initial values. (Author abstract) 10 refs.

**074293 MINIMIZING MULTIMODAL FUNCTIONS OF CONTINUOUS VARIABLES WITH THE 'SIMULATED ANNEALING' ALGORITHM.** A new global optimization algorithm for functions of continuous variables is presented, derived from the 'Simulated Annealing' algorithm recently introduced in combinatorial optimization. The algorithm is essentially an iterative random search procedure with adaptive moves along the coordinate directions. It permits uphill moves under the control of a probabilistic criterion, thus tending to avoid the first local minima encountered. The algorithm has been tested against the Nelder and Mead simplex method and against a version of Adaptive Random Search. The new method proved to be more reliable than the others, being always able to find the optimum, or at least a point very close to it. It is quite costly in term of function evaluations, but its cost can be predicted in advance, depending only slightly on the starting point. (Edited author abstract) 18 refs.

**074294 GENERALIZED DESCENT METHODS FOR ASYMMETRIC SYSTEMS OF EQUATIONS.** We consider generalizations of the steepest descent algorithm for solving asymmetric systems of equations. We first show that if the system is linear and is defined by the matrix  $M$ , then the method converges if  $M^2$  is positive definite. We also establish easy to verify conditions on the matrix  $M$  that ensure that  $M^2$  is positive definite, and develop a scaling procedure that extends the class of matrices that satisfy the convergence conditions. In addition, we establish a local convergence result for nonlinear systems defined by uniformly monotone maps, and discuss a class of general descent methods. All of the methods that we consider reduce to standard nonlinear programming algorithms. (Edited author abstract) 25 refs.

**074306 REGULARIZED METHOD OF LINEARIZATION FOR MINIMIZING A CONVEX FUNCTION ON A POLYHEDRAL SET WITH ERRORS IN THE INPUT DATA.** The problem of minimization of a convex function on a polyhedral set is considered without the assumption of Slater's condition. A regularized method of linearization is suggested, assuming that the function being minimized, the functions defining the set, and their gradients are given with an error. The convergence of a sequence of Lagrange multipliers of the minimization of Tikhonov's function is demonstrated, as well as a strong convergence of the method to a normal solution. (Author abstract) 5 refs.

Chirich, N.T. *Moscow Univ Comput Math Cybern* n 2 1987 p 25-30.

**074307 ON THE VARIATIONAL PROCESS IN PARAMETER OPTIMIZATION.** The simplest constrained optimization problem is used to investigate the concept of variations of variations. It is shown that variations of dependent variations are nonzero whereas variations of independent variations are zero. The existence of these variations adds to the second variation a term which vanishes because of first-variation conditions but which contributes directly to the third and higher variations. These variations are needed in particular if the second variation vanishes and in general if the whole process is to be done correctly. Finally, the same results are derived using the Taylor series expansion. (Author abstract) 4 refs.

Hull, D.G. (Univ of Texas, Austin, TX, USA). *J Optim Theory Appl* v 56 n 1 Jan 1988 p 31-38.

**074308 APPROXIMATION OF SOLUTION FOR LOCATION PROBLEMS.** This paper is devoted to a class of location problems with polyhedral norms. The objective function is shown to be a piecewise convex function which has to be maximized. We prove that the optimal locations belong to a finite set of intersection points, and we present an efficient method operating upon this finite set and providing a strict local maximum with few computational efforts. **074316 CONVEX TWO-LEVEL OPTIMIZATION.** A model for a two-level planning problem is presented in the form of a static Stackelberg game. By assumption, play is sequential and noncooperative; however, the leader can influence the actions of the followers through a set of coordination variables while the followers' responses may partly determine the leader's payoff. Under certain convexity assumptions, it is shown that the feasible region induced by the leader is continuous in the original problem variables. This observation, coupled with two corollary results, is used as a basis for a hybrid algorithm which clings to the inducible region until a local optimum is found. A branching scheme is then employed to locate other segments of the region, eventually terminating with the global optimum. (Edited author abstract) 13 refs.

Bard, Jonathan F. (Univ of Texas, Austin, TX, USA). *Math Program* v 40 n 1 Jan 1988 p 15-27.

**074317 SECOND-ORDER NECESSARY CONDITIONS IN SEMISMOOTH OPTIMIZATION.** First- and second-order conditions are given which are necessary for a function  $f$  to have a local minimal value at  $x^*$  in  $R^n$ . It is assumed that  $f$  is locally Lipschitzian near  $x^*$  and semismooth at  $x^*$ . The necessary conditions are expressed in terms of the generalized gradients of nonsmooth analysis and certain second-order directional derivatives. The method of proof bears no resemblance to standard methods. Three special cases are discussed here, but applications to constrained problems are made elsewhere. (Author abstract) 13 refs.

**074318 STATE-OF-THE-ART IN PARALLEL NONLINEAR OPTIMIZATION.** This survey is concerned with variants of nonlinear optimization methods designed for implementation on parallel computers. First, we consider a variety of methods for unconstrained minimization. We consider a particular type of parallelism (simultaneous function and gradient evaluations). We focus on promising approaches for solving large, well-structured constrained problems: dualization of problems with separable objective and constraint functions, and decomposition of hierarchical problems with linking variables (typical for Bender's decomposition in

the linear case). Finally, we outline the key issues in future computational studies of parallel nonlinear optimization algorithms. (Edited author abstract) 66 refs.

**074319 USING TABU SEARCH TECHNIQUES FOR GRAPH COLORING.** Tabu search techniques are used for moving step by step towards the minimum value of a function. A tabu list of forbidden movements is updated during the iterations to avoid cycling and being trapped in local minima. Such techniques are adapted to graph coloring problems. We show that they provide almost optimal colorings of graphs having up to 1000 nodes and their efficiency is shown to be significantly superior to the famous simulated annealing. **074320 NUMERICAL EXPERIENCE WITH THE TRUNCATED NEWTON METHOD FOR UNCONSTRAINED OPTIMIZATION.** The truncated Newton algorithm was devised by R. Dembo and T. Steihaug for solving large sparse unconstrained optimization problems. When far from a minimum, an accurate solution to the Newton equations may not be justified. Dembo's method solves these equations by the conjugate direction method, but truncates the iteration when a required degree of accuracy has been obtained. We present favorable numerical results obtained with the algorithm and compare them with existing codes for large-scale optimization. (Author abstract) 6 refs.

**074321 STOCHASTIC ALGORITHM FOR OPTIMIZATION PROBLEMS WITH CONTINUA OF INEQUALITIES.** Optimization algorithms for solving mathematical programming problems involving continua of inequalities are presented. The algorithms use an outer-approximation method, by which they attempt to approximate, at each point, the maxima of sets of inequality constraints. They do so by performing random experiments, resulting in a finite number of points, over which the maximum is taken. They use constraint-dropping schemes, by which they eliminate points from the constraint set at hand, which are felt to be irrelevant. At each point that the algorithms construct, they evaluate a measure of optimality, which indicates the distance of the point from the set of solutions of the optimization problem. They use this measure to determine the number of random experiments performed. Thus, the number of such experiments tends to be small initially, when the points at hand are far from optimal, and they tend to increase when an optimal point is approached. **074325 METHOD OF LINEARIZATION.** A presentation is given of basic theoretical results associated with the construction and justification of one of the most popular and universal numerical methods of nonlinear optimization, the method of linearization. The method of linearization was first described in 1970, as a method of numerical solution of systems of nonlinear equations and inequalities. Over the years passed, the method of linearization was analyzed theoretically, the class of problems that it could solve was broadened, modifications were proposed, and rules for changing the parameters in the algorithm were perfected. The purpose of the present article is to give a compressed review of all these changes and peculiarities, emphasizing the finer and more typical features of the method. (Edited author abstract) 23 refs.

**074328 ON THE CONVERGENCE OF STATIONARY DISTRIBUTIONS IN SIMULATED ANNEALING ALGORITHMS.** Simulated annealing is a randomized optimization algorithm which accepts deterioration of the objective function with a probability depending on a control parameter  $t$  in each iteration. Under general assumptions we show that the equilibrium distributions with respect to the parameter levels converge to the distribution which selects a global optimum with probability one. This result may be taken as an explanation for the observed good performance of simulated annealing implementations which prefer many iterations on relatively few parameter levels to relatively few iterations at many parameter levels. (Author abstract) 17 refs.

**074329 QUADRATIC OPTIMIZATION PROBLEMS.** An examination is made of numerical methods associated with external problems with quadratic objective functional with constraints. It is shown that, in the multiextremal case, lower bound estimates of the optimal value of the objective functional that are necessary for application of methods of the branch-and-bound type can be obtained by duality methods with solution of a convex optimization problem with constraints requiring that certain matrices be nonnegative-definite. Methods of solving estimation problems are examined. The application of the approach described to certain discrete optimization problems is described. (Author abstract) 21 refs.

**074331 APPROXIMATE SOLUTION OF THE TRUST REGION PROBLEM BY MINIMIZATION OVER TWO-DIMENSIONAL SUBSPACES.** The trust region problem, minimization of a quadratic function subject to a spherical trust region constraint, occurs in many optimization algorithms. In a previous paper, the authors introduced an inexpensive approximate solution technique for this problem that involves the solution of a two-dimensional trust region problem. They showed that using this approximation in an unconstrained optimization algorithm leads to the same theoretical global and local convergence properties as are obtained using the exact solution to the trust region problem. This paper reports computational results showing that the two-dimensional minimization approach gives nearly optimal reductions in the  $n$ -dimension quadratic model over a wide range of test cases. (Edited author abstract) 15 refs.

**074332 CHORDAL PRECONDITIONER FOR LARGE-SCALE OPTIMIZATION.** We propose an automatic preconditioning scheme for large sparse numerical optimization. The strategy is based on an examination of the sparsity pattern of the Hessian matrix: using a graph-theoretic heuristic, a block-diagonal approximation to the Hessian matrix is induced. The blocks are submatrices of the Hessian matrix; furthermore, each block is chordal. That is, under a positive definiteness assumption, the Cholesky factorization can be applied to each block without creating any new nonzeros (fill). Therefore the preconditioner is space efficient. We conduct a number of numerical experiments to determine the effectiveness of the preconditioner in the context of a linear conjugate-gradient algorithm for optimization. (Author abstract) 25 refs.

**074335 SENSITIVITY ANALYSIS IN MULTIOBJECTIVE OPTIMIZATION.** Sensitivity analysis in multiobjective optimization is dealt with. Given a family of parametrized multiobjective optimization problems, the perturbation map is defined as the set-valued map which associates to each parameter value the set of minimal points of the perturbed feasible set in the objective space with respect to a fixed ordering convex cone. The behavior of the perturbation map is analyzed quantitatively by using the concept of contingent derivatives for set-valued maps. Particularly, it is shown that the sensitivity is closely related to the Lagrange multipliers in multiobjective programming. (Author abstract) 10 refs.

**074337 FARKAS' THEOREM OF NONCONVEX TYPE AND ITS APPLICATION TO A MIN-MAX PROBLEM.** This note is concerned with the generalization of Farkas' theorem and its application to derive optimality conditions for a min-max problem. Farkas' theorem is generalized to a system of inequalities described by sup-min type positively homogeneous functions. This generalization allows us to deal with optimization problems consisting of objective and constraint functions whose directional derivatives are not necessarily convex with respect to the directions. As an example of such problems, we formulate a min-max problem and derive its optimality conditions. (Author abstract) 12 refs.

**074340 TWO APPROACHES TO THE SOLUTION OF PROBABILISTIC OPTIMIZATION PROBLEMS.** Probabilistic optimization problems in which a quantile of the objective function serves as quality criterion in the presence of supplementary constraints are examined. Two approaches are considered. The first assumes the use of gradient methods. A formula for the gradient of the quantile function is derived for this purpose. The results can be used not only for the realization of gradient methods, but also in the form of necessary optimality conditions for the search for an optimal strategy, for testing a strategy suspected to be optimal, and for investigating the convergence of various numerical procedures. The second is the generalized minimax approach which consists of reducing the original probabilistic problem to some equivalent minimax problem in which supplementary optimization is performed over sets in the realization space of the random factors. An iterative method which realizes this approach is developed. Provides means for implementing such double optimization on strategies and indicated sets. Its convergence is proven for a broad class of problems. (Edited author abstract) 7 refs.

**074342 MORSE THEORY FOR SOME LOWER- $C^2$  FUNCTIONS IN FINITE DIMENSION.** Using inf-regularization methods, we prove that Morse inequalities hold for some lower- $C^2$  functions. For this purpose, we first recall some properties of the class of lower- $C^2$  functions and of their Moreau-Yosida approximations. Then, we establish, under some qualification conditions on the critical points, that it is possible to define a 'Morse' index for a lower- $C^2$  function  $f$ . This index is preserved by the Moreau-Yosida approximation process. We prove in particular that the Moreau-Yosida approximations are twice continuously differentiable around such a critical point which is shown to be a strict local minimum of the restriction of  $f$  and of its approximations to some affine space. In a last step, Morse inequalities are written for Moreau-Yosida approximations and with the aid of deformation retractions we prove that these inequalities also hold for some lower- $C^2$  functions. (Author abstract) 27 refs.

**074343 CONVERGENCE AND RESTART IN BRANCH-AND-BOUND ALGORITHMS FOR GLOBAL OPTIMIZATION.** APPLICATION TO

CONCAVE MINIMIZATION AND D.C. OPTIMIZATION PROBLEMS. A general branch-and-bound conceptual scheme for global optimization is presented that includes along with previous branch-and-bound approaches also grid-search techniques. The corresponding convergence theory, as well as the question of restart capability for branch-and-bound algorithms used in decomposition or outer approximation schemes are discussed. As an illustration of this conceptual scheme, a finite branch-and-bound algorithm for concave minimization is described and a convergent branch-and-bound algorithm, based on the previous one, is developed for the minimization of a difference of two convex functions. (Author abstract) 35 refs.

**074345 DESIGN CENTERING PROBLEM AS A D.C. PROGRAMMING PROBLEM.** The following problem is studied: Given a compact set  $S$  in  $R^n$  and a Minkowski Functional  $p(x)$ , find the largest positive number  $r$  for which there exists  $x$  belonging to  $S$  such that the set of all  $y$  belonging to  $R^n$  satisfying  $p(y-x) \leq r$  is contained in  $S$ . It is shown that when  $S$  is the intersection of a closed convex set and several complementary convex sets (sets whose complements are open convex) this 'design centering problem' can be reformulated as the minimization of some dc function (difference of two convex functions) over  $R^n$ . In the case where, moreover,  $p(x) = (x^T A x)^{1/2}$ , with  $A$  being a symmetric positive definite matrix, a solution method is developed which is based on the reduction of the problem to the global minimization of a concave function over a compact convex set. (Author abstract) 15 refs.

**074349 INCLUSION FUNCTIONS AND GLOBAL OPTIMIZATION II.** This paper discusses algorithms of R.E. Moore, S. Skelboe, K. Ichida and Y. Fujii, and E. Hansen for solving the global unconstrained optimization problem. These algorithms have been tried on computers, but a thorough theoretical discussion of their convergence properties has been missing. In part I the convergence to the global minimum was studied. The present paper is concerned with the different behaviors of these algorithms when they are used for the determination of global minimum points,  $G$ , a superset of  $G$ , or exactly  $G$ . The algorithms are applicable to a very general class of functions: functions which are continuous, and have suitable inclusion functions. The number of global minimum points can be infinite. (Edited author abstract). 14 Refs.

**074350 TRACING STRUCTURAL OPTIMA AS A FUNCTION OF AVAILABLE RESOURCES BY A HOMOTOPY METHOD.** Optimization problems are typically solved by starting with an initial estimate and proceeding iteratively to improve it until the optimum is found. The design points along the path from the initial estimate to the optimum are usually of no value. This work proposes a strategy for tracing a path of optimum solutions parameterized by the amount of available resources. The paper specifically treats the optimum design of a structure to maximize its buckling load. Equations for the optimum path are obtained using Lagrange multipliers, and solved by a homotopy method. The solution path has several branches due to changes in the active constraint set and transitions from unimodal to bimodal solutions. The Lagrange multipliers and second-order optimality conditions are used to detect branching points and to switch to the optimum solution path. (Edited author abstract). 15 Refs.

*Inf Theory* v IT-33 n 6 p 877-881.

**074353 EFFICIENT OPTIMIZATION WITH INTEGRATED GRADIENT APPROXIMATIONS.** A flexible and effective algorithm is proposed for efficient optimization with integrated gradient approximations. It combines the techniques of perturbations, the Broyden update, and the special iterations of Powell. Perturbations are used to provide an initial approximation as well as regular corrections. The approximate gradient is updated using C.G. Broyden's formula (1965) in conjunction with the special iterations of M.J.D. Powell (1970). A modification to the Broyden update is introduced to exploit possible sparsity of the Jacobian. Utilizing this algorithm, powerful gradient-based nonlinear optimization tools for circuit CAD can be used without the effort of calculating exact derivatives. Applications of practical significance are demonstrated. The examples include robust small-signal FET modeling using the  $I_1$  techniques and simultaneous processing of multiple circuits, worst-case design of a microwave amplifier, and minimax optimization of a five-channel manifold multiplexer. Computational efficiency is greatly improved over estimating derivatives entirely by perturbations. 19 refs.

**074355 CONSTRUCTIVE DUAL METHODS FOR DISCRETE PROGRAMMING.** This paper gives a general theory for constructive dual methods in discrete programming. These techniques are concerned with the reduction of the feasibility set in order to obtain a dual problem which is easy to solve and has no duality gap. If a particular dual problem fails to solve the primal problem, then a stronger dual problem is constructed and the analysis continued. The relaxation approximation is made progressively tighter until, in a finite number of iterations, an optimal solution is reached. (Edited author abstract) 10 refs.

Barcia, Paulo (Univ Nova de Lisboa, Lisbon, Port). *Discrete Appl Math* v 18 n 2 Nov 1987, Rio Conf on Comb Optim, Rio de Janeiro, Braz, Jul 8-19 1985 p 107-117.

**074356 ADDING ACTIVITIES TO THE DUAL INSTEAD OF CUTS TO THE PRIMAL PROBLEM.** When solving a problem by appending cuts the dimension of the corresponding simplex tableau and the basic inverse oscillates, it becomes difficult to implement a cutting plane algorithm based on a standard LP code. Moreover, it is complicated to express a cut in the original variables. In this paper we show that by formulating the dual to the problem and adding activities, these adverse effects can be circumvented. It is shown that the set of activities which can be added is the same as the set of cuts which can be appended and that it is easy to exhibit an activity in the original primal variables. As a consequence of this a new formulation of a cut in the original primal variables is given. (Author abstract) 4 refs.

**074357 TELEPHONIC SWITCHING CENTRE NETWORK PROBLEM: FORMALIZATION AND COMPUTATIONAL EXPERIENCE.** The switching center network problem consists of looking for a topology on the urban street network that minimizes the total cost of cables and subterranean piping infrastructure necessary to link a telephonic center and its subscribers. A simple version of the real model can be viewed as a mixture of Steiner's problem on graphs and a transshipment problem with a single source. We show that a very good initial solution for the problem can be obtained using Dijkstra's minimum distance algorithm. We discuss the theoretical background and the computational experience concerning a software for microcomputers that uses such initialization strategy and that is running quite well in practice. We present the heuristic that looks for scale economies provenient from trajectory coincidences, a local optimum strategy, and also discuss global optimum strategies which should be tested following recent experience concerning Steiner's problem. (Author abstract) 14 refs.

**074358 PARALLEL BRANCH AND BOUND ALGORITHM FOR THE QUADRATIC ASSIGNMENT PROBLEM.** We propose a parallel branch and bound algorithm for the quadratic assignment problem; this algorithm has been implemented on an asynchronous multiprocessor machine with shared memory (the Cray X-MP). For problems with size  $n \geq 10$ , the improvement in using  $n$  processors is very close to  $n$ , and moreover very good results are obtained for a classical example from the literature with size 12. (Author abstract) 18 refs.

**074359 NEW ENUMERATION SCHEME FOR THE KNAPSACK PROBLEM.** This paper presents a new enumeration scheme to solve the one-dimensional knapsack problem motivated by some observations on number theory, more specifically on the determination of the number of solutions of linear diophantine equations. This new algorithm is pseudopolynomial and its special features provide a reduction in running time and in the computational memory requirements as compared with other exact (dynamic programming) methods. (Author abstract) 35 refs.

**074360 CONCURRENT FUNCTION EVALUATIONS IN LOCAL AND GLOBAL OPTIMIZATION.** This paper discusses some basic opportunities for the use of multiprocessing in the solution of optimization problems. We consider two fundamental optimization problems, unconstrained optimization and global optimization, in the important case when function evaluation is expensive and gradients are evaluated by finite differences. First we discuss some simple parallel strategies based upon the use of concurrent function evaluations to evaluate the finite difference gradient. These include the speculative evaluation of the gradient concurrently with the evaluation of the function before it is known whether the gradient value at this point will be required. We present examples that indicate the effectiveness of these parallel strategies for unconstrained optimization. We also give experimental results that show the effect of using these strategies to parallelize each of the multiple local minimizations within a recently proposed concurrent global optimization algorithm. We briefly discuss several parallel optimization strategies that are related to these

approaches but make more fundamental changes to standard sequential optimization algorithms. (Author abstract) 14 refs.

**074361 ON THE CONSTRUCTION OF MINIMIZATION METHODS OF QUASI-NEWTON TYPE.** The secant equation, which underlies all standard 'quasi-Newton' minimization methods, arises from the use of a linear function to model the gradient along a chosen direction. We present new minimization algorithms, derived by replacing this linear model with a more general one involving a free parameter, which is determined by using information contained in the current approximate Hessian. The use of such a model can give more flexibility in the criteria to be satisfied during the line-search. The new methods can operate as soon as a reasonable approximation to the Hessian has been accumulated and may, in one sense, be viewed as acceleration techniques for quasi-Newton methods. (Author abstract) 11 refs.

**074362 GEOMETRIC OPTIMIZATION AND THE POLYNOMIAL HIERARCHY.** We illustrate two techniques of accurately classifying the optimization versions of geometric problems in the polynomial hierarchy. We show that if  $NP \neq Co-NP$ , then there are interesting natural geometric optimization problems (location-allocation problems under minsum) in  $\Delta_2^P$  that are in neither  $NP$  nor  $Co-NP$ . Hence, all these problems are shown to belong properly to  $\Delta_2^P$ , the second level of the polynomial hierarchy. We also show that there are some interesting geometric optimization problems (location-allocation problems under minmax) complete for a class  $D^P$  (which is contained in  $\Delta_2^P$  and contains  $NP$  union  $Co-NP$ ). (Author abstract) 17 refs.

## Analogies

**074363 SIMULATED ANNEALING WITH CONSTANT THERMODYNAMIC SPEED.** Arguments are presented to the effect that the optimal annealing schedule for simulated annealing proceeds with constant thermodynamic speed, i.e., with  $dT/dt = -(\nu T)/(e\nu/C)$ , where  $T$  is the temperature,  $e$  is the relaxation time,  $C$  is the heat capacity,  $t$  is the time, and  $\nu$  is the (constant) thermodynamic speed. Experimental results on a graph partitioning problem which can be solved exactly are shown to be consistent with this conjecture. (Author abstract) 24 Refs.

**074364 STABILITY OF SOLUTIONS OF COMBINATORIAL OPTIMIZATION PROBLEMS.** A method of analysis of the sensitivity of optimal and approximate solutions of combinatorial optimization problems with a linear goal function is suggested, measuring the response of the goal function to changes in the values of the input parameters in terms of which the goal function is expressed. Formulas are defined for the stability radius for the quality estimates of approximate

solutions of the problem; the admissible variation intervals of the input parameters are identified. The practical applications of this approach are illustrated by an optimal routing of requests for nonsharable resources in a computer network. (Author abstract) 9 refs.

## Computer Aided Analysis

**074366 SEARCH PROCEDURE FOR SOLVING SMALL NONLINEAR PROGRAMS ON SMALL COMPUTERS.** This work describes a brute-force procedure for solving small nonlinear optimization problems. The scheme will work on any micro, or larger, computer on which it is possible to express the functions appearing in the problem. Sample problems are included, along with the code, in C, used to solve two of them. The code is derived from a procedure used to find the curve of intersection of three-dimensional surfaces. **074367 USING A MICROPROCESSOR FOR THE ON-LINE DETECTION OF A BOUNDARY OPTIMUM.** This paper describes optimisation techniques which can be implemented under steady state to a function possessing its optimum feasible value on the boundary line of the allowable operating region. Consideration is given to soft boundary constraints and the associated difficulties when a microcomputer is used to achieve the optimisation. Methods are presented which if included in the algorithm would allow the use of a simple low-cost microcomputer and would result in a fast and successful convergence. Such techniques are implemented on-line for the steady state minimisation of the current supplied to the stator of an inverter-driven induction motor. Both the operation of the system and the implementation of the minimisation algorithm were achieved under the control of a single eight-bit microprocessor (INTEL 8085). (Author abstract) 8 refs.

**074368 SAMURAI: A GENERAL AND EFFICIENT SIMULATED-ANNEALING SCHEDULE WITH FULLY ADAPTIVE ANNEALING PARAMETERS.** This paper describes a novel simulated annealing procedure with a general scope. New concepts have been derived for dynamically and efficiently updating the essential annealing parameters. These have allowed speeding up the convergence and saving a lot of objective function evaluations compared to other methods which have been published. Our most important contribution is the introduction of a generally applicable and adaptive

'inner-loop criterion'. The quality of the results obtained with this general optimization routine has been demonstrated for the accurate characterization of worst-case limit-cycle behavior and other finite word-length effects in digital filters. The general applicability of our approach is substantiated with some promising results for the solution of clustered TSP problems with many cities. Hierarchical partitioning is established as an important property for distinguishing applications which are well-suited for simulated annealing from those which are not. (Edited author abstract) 34 Refs.

**074369 COMPUTER EXPERIMENTS WITH THE SEMI-INFINITE OPTIMIZATION PROGRAM SUITABLE FOR THE CACSD.** An application of the semi-infinite optimization program (SIOP) to the computer-aided control system design (CACSD) is considered to show how the appropriate software tools can be applied to form the proper CACSD environment. As an example of the micro CACSD application to the optimum transient response design, the dc positional control system of the third order is considered. Different performance indices are used as the objective function to be minimized. The optimum gain of controller is considered as one of the design parameters to be found. Different techniques of the semi-infinite optimization which can be applied to the general unconstrained optimization methods to handle with the semi-infinite constraints (patterns) are discussed. The results of the semi-infinite optimization for the example chosen are given for six different performance indices and the efficiency of such an approach is discussed. It is also shown how the patterns can be used to control the way of getting the desired values of some parameters. (Author abstract) 7 refs.

## Theory

**074370 SCALARIZATION OF VECTOR OPTIMIZATION PROBLEMS.** We investigate the scalar representation of vector optimization problems in close connection with monotonic functions. We show that it is possible to construct linear, convex, and quasiconvex representations for linear, convex, and quasiconvex vector problems, respectively. For finding all the optimal solutions of a vector problem, it suffices to solve certain scalar representations only. The question of the continuous dependence of the solution set upon the initial vector problems and monotonic functions is discussed. (Edited author abstract) 11 refs.

**074371 LEXICOGRAPHICAL ORDER AND DUALITY IN MULTIOBJECTIVE PROGRAMMING.** This paper studies the applications of lexicographical order relation for vectors in the mathematical theory of multiobjective programming. We show that any Pareto minimum of an unconstrained convex problem is the lexicographical minimum for the problem associated to a matrix multiplier having lexicographical positive columns. A similar result is also obtained for inequality constrained problems. Our approach to the theory of duality follows the pattern of J. Jahn but we substitute vectors by matrices in the formulation of the dual problem and the usual scalar order relation by the lexicographical order relation. This

allows us to state the Strong Duality Theorem in terms of Pareto minima and to eliminate some regularity assumptions. (Author abstract) 13 refs.

**074376 OPPORTUNITY KNOCKS FOR NEW OP-**

**TOCOUPLERS.** The move to aluminum gallium arsenide light-emitting diodes (AlGaAs LEDs) has much relaxed the chief constraint on optocoupler performance—the net gain-bandwidth product value. Optocoupler gain is strongly affected by the efficiency with which an LED produces light from a given current. Bandwidth is significantly limited by the LED's response time. The use of AlGaAs for the LED emitter has increased the gain-bandwidth value. AlGaAs LEDs are brighter, faster, more linear, and slower to degrade than their predecessors. They enable optocouplers to operate either at very high speeds (40 Mbaud) or at relatively high speeds (5 Mbaud) but with low input currents (0.5 mA) ideal for low-power applications. Several ways of using the new optocouplers are presented.

**074377 OPTICAL ENCODERS FOR CUSTOM REQUIREMENTS.** Custom optical encoders can use a variety of different photodetectors to translate the light from the emitter into photocurrent. These include PIN and PN silicon diodes, photo-transistors, photo-Darlington and photo-resistors. Each of these offers benefits and could be used as a viable solution. The author discusses the size, resolution and performance requirements for a custom optical encoder design.

Wiesner, Werner (Hewlett-Packard Components); Lewis, Chris. *New Electron* v 20 n 17 Sep 1 1987 p 26-27.

**074378 DEVELOPMENTS IN FIBRE OPTIC SENSORS.** For sensing applications, an optical fibre can be used in two ways: either purely as a light carrier (extrinsic) or it can be involved in the sensing process itself (intrinsic). The latter relies on inhomogeneities of a fibre which cause transmission loss. The main mechanisms for transmission loss are: coupling; absorption; scattering; radiation; and jointing. The article reviews several fiber optic sensor examples, including Schlieren, cantilever, microbending, and interferometric strain sensors. Temperature and current sensing devices using optical fibers are described.

Hickleton, Andrew. *New Electron* v 20 n 17 Sep 1 1987 p 39-40.

**074379 OPTOELECTRONICS AND COMPUTING.** The article reviews the present and future use of optoelectronics in data storage, communications, switching systems, parallel processors, ultrafast large chips for communications and timing. A major future role for optoelectronics seems as certain in computing as it already is in communications.

**074382 GENERATION AND STATISTICAL PROPERTIES OF OPTICAL DEAD-TIME EFFECTS.** An optoelectronic device that can generate either the non-paralyzable or the paralyzable dead-time effect has been constructed using a feedback scheme in conjunction with the acousto-optic deflector. 'Semi-classical' experiments show good agreement with the theory, which predicts antibunching and sub-Poissonian statistics. An expression for the correlation function of an arbitrary order is obtained for a general renewal process. From this general result, exact expressions for autocorrelation functions for both the non-paralyzable and the paralyzable counters are derived when the dead-time is greater than twice the sample time. The Fano factor is considered for both the non-paralyzable and the paralyzable counters. It is seen that the Fano factor for the paralyzable counter can be smaller than that for the non-paralyzable counter for a certain range of the input count rate. (Author abstract) 15 refs.

**074383 GUIDES D'ONDES ENFOUIS DANS DES SUPERRESEAUX GaAs-AlGaAs CREES PAR INTERDIFFUSION INDUITE PAR DES IMPURETES.** [Buried Waveguides in GaAs-AlGaAs Superlattices by Impurity Induced Layer Disorder]. Heterostructures comprised of  $Al_xGa_{1-x}As-Al_yGa_{1-y}As$  superlattices or quantum wells are compositionally stable up to very high temperatures but may become unstable with the introduction of particular impurities. The resulting layer interdiffusion leads to a compositionally averaged material. Since the introduction of impurities can be controlled by standard photolithographic masking techniques, the material properties can be modified in unmasked region. The disordered region has a wider bandgap and a lower index of refraction. This property has been used to fabricate delineated buried waveguides which exhibit very low propagation losses. Experimental results show that the index step between the layered and disordered region is at least 2.3%. While not large in magnitude, this index difference is sufficient to allow complex waveguide structures to be made in the same materials used for other high performances opto-electronic devices. (Author abstract) 28 refs. In French.

**074386 ION IMPLANTATION INTO InP FOR OPTOELECTRONIC DEVICES.** In comparison to the widespread use of ion implantation for the fabrication of Si and GaAs devices, doping of InP crystals via ion implantation is still in its infancy. Nevertheless, ion implantation as well as epitaxial techniques are the key technologies for future optoelectronic integrated circuits. It is shown that n- and p-type regions in InP can be implanted reproducibly under suitable annealing conditions. Profiles of the implanted impurities are compared with the resultant carrier profiles. The high quality of implanted pn junctions in InP is demonstrated by presenting results of diode measurements. (Author abstract). 28 refs.

Haessler, W. (Siemens AG, Munich, West Ger); Roemer, D.; Plibhal, M. *Siemens Forsch Entwicklungsber* v 17 n 4 1988 p 177-183.

**074387 NOVEL SINGLE QUANTUM WELL OPTOELECTRONIC DEVICES BASED ON EXCITON BLEACHING.** Planar high-speed optoelectronic devices offering advantages for optoelectronic integration are proposed. Exciton-resonant light propagates along a single-mode rib waveguide containing a single quantum well (SQW), the only absorbing medium in the waveguide. The two-dimensional excitonic optical absorption is controlled by the bleaching effect induced by free carriers, whose electrical conduction simultaneously makes possible optical detection and high-speed transistor action. Three such optical modulating devices are: (1) a gate-controlled single-quantum-well field-effect transistor optical modulator (FETOM); (2) an optically readable memory element; and (3) an optically switched charge storage device. The FETOM, in which the free-carrier density in the SQW is controlled by the gate voltage, offers high speed (22 ps), small size (125  $\mu\text{m}$ ), and unique potential for optoelectronic integration. 11 refs.

**074388 SEMICONDUCTOR OPTOELECTRONIC DEVICES BASED ON INTERFERENCE-INDUCED CARRIER MODULATION.** Transport of carriers generated under the influence of optically induced spatial modulation is investigated theoretically and experimentally in semiconductors. The resulting transient photocurrent is studied under varied degrees of optical interference. It is shown that strong anisotropic properties describable by an interaction tensor are suitable for device applications. Device properties are characterized analytically and are seen to be useful for the processing of optical signals with picosecond and femtosecond features. Accurate modeling demonstrates the formation of strong nodal fields whose effect is detrimental to the achievement of high current extinction. The manifestation of interference-induced carrier modulation is demonstrated with high-contrast recordings of autocorrelation of picosecond laser pulses in homogeneous materials. In other experiments, monitoring of laser coherence ranging from picoseconds to tens of femtoseconds is shown. 39 refs.

**Applications** See Also DATA STORAGE, OPTICAL—Inspection; DATA TRANSMISSION EQUIPMENT; INTEGRATED CIRCUITS, MONOLITHIC—Manufacture; OPTICAL DATA PROCESSING—Design.

**074392 OPTOELECTRONIC ICs FOR HIGH-SPEED PARALLEL PROCESSING.** In light of the increase in the number of interconnections between pairs of chips and between various systems, one would expect a decrease in the number of required interconnections at higher levels. However, current applications of intelligent interconnection structures in the design of next-generation computers prove the opposite. High-performance computing, it seems, also requires a high-performance communication structure. Unlike conventional electrical designs, optical interconnection techniques yield many advantages. Beyond the well-known advantages of reduced crosstalk and electromagnetic interference, optical connections also yield much wider bandwidths, larger fanouts and lower system power, and allow greater system complexity. Next-generation computers will likely use optoelectronic interconnections.

**074394 GaAs MONOLITHIC INTEGRATED PHOTORECEIVER FOR 0.8  $\mu\text{m}$  WAVELENGTH: ASSOCIATION OF SCHOTTKY PHOTODIODE AND FET.** We report the fabrication and the characterization of a GaAs planar monolithic integrated photoreceiver. It consists of a semiplanar Schottky photodiode, associated with a field-effect transistor. Static, dynamic and noise properties have been investigated and interpreted, taking into account the particular characteristics of the material and the design of the integrated circuit. For example, sensitivity up to  $-30$  dBm can be achieved at 250 Mbits/s for a 1E-9 bit error rate. (Author abstract) 9 refs.

**074395 NEW APD-BASED RECEIVERS PROVIDING TOLERANCE TO ALIGNMENT JITTER FOR BINARY OPTICAL COMMUNICATIONS.** Receiver signal processing which leads to signal element waveforms satisfying Nyquist's first and second criteria (with respect to the depressed optimum decision threshold encountered with high performance avalanche photodiode receivers is considered. This results in an eye pattern for binary optical communications, which is well disposed around the depressed threshold. These new signal design targets are thus well suited to untimed transmission while also offering improved tolerance to alignment jitter when used in conventional fully retimed optical receivers. The practical realization is considered to consist of signal shaping networks with responses closely approximating these new designs, and receiver performance is evaluated. (Author abstract) 8 refs.

**074396 NOVEL WAVELENGTH-RESONANT OPTOELECTRONIC STRUCTURE AND ITS APPLICATION TO SURFACE-EMITTING SEMICONDUCTOR LASERS.** An optimized design for optoelectronic devices which depends on the interaction between an electromagnetic standing wave and the carrier population is described. The structure consists of quantum well layers spaced at one half the wavelength of a selected optical transition in quantum wells. This spatial periodicity allows the amplifying or absorbing medium quantum wells to coincide with the peaks of the standing wave optical field in the Fabry-Perot cavity. In such a periodic medium, the gain or absorption for the selected wavelength is enhanced by a factor of two compared to a uniform medium. This concept was applied to fabricate a surface-emitting semiconductor laser in the GaAs/Al-

GaAs system. It is claimed that lasing was achieved with the shortest gain medium length (320 nm) ever reported. (Edited author abstract). 4 Refs.

**074397 DESIGN AND PERFORMANCE OF AN OPTOELECTRONIC MATRIX SWITCH USING SI-P-I-N PHOTODIODES.** Switching speed, isolation, optical-source requirements, and attainable matrix dimensions of an optoelectronic matrix switch using Si p-i-n photodiodes are discussed. By charging the internal capacitance of the diode with a photocurrent, forward bias voltages are attained that establish off-states. The novel features of the matrix switch are that the switch elements have high output impedance at off-states, and no electrical power is required to establish the off-states. This leads to advantages in fabricating large-dimension matrix switches. 8 refs.

**074398 5.2-GHz BANDWIDTH MONOLITHIC GaAs OPTOELECTRONIC RECEIVER.** A high-speed monolithic optoelectronic receiver consisting of a photodetector, a transimpedance amplifier and a 50- $\Omega$  output buffer stage has been fabricated using an enhancement/depletion 0.35- $\mu$ m recessed-gate GaAs MESFET process. The interdigitated metal-semiconductor-metal (MSM) photodetector has a dark current of 0.8 nA, a responsivity of 0.2 A/W, and a capacitance of 12 fF. The bandwidth of the receiver is 5.2 GHz with an effective transimpedance of 300  $\Omega$  into a 50- $\Omega$  load, which corresponds to a transimpedance bandwidth product of 1.5 THz- $\Omega$ . 12 refs.

**074401 PLANAR MONOLITHIC INTEGRATION OF LED AND FET DEVICES ON A CONDUCTIVE SUBSTRATE.** Results of a study on the monolithic integration of AlGaAs light-emitting diodes with GaAs

field-effect transistors (FETs) on a conductive p-GaAs substrate are described. Using a selective growth technique, a horizontal configuration is fabricated that allows separate optimization of the two types of devices and provides a quasiplanar surface. This approach is compatible with standard GaAs integrated-circuit technology. By inserting an undoped layer and a p-n junction between the active layer of the FET and the substrate, leakage currents below 500  $\mu$ A for bias voltage up to 9 V are obtained. The emitted light intensity of the LED, connected in series with the FET, exhibits a nearly linear dependence on the diving gate potential. Fall and rise times around 20 ns are determined from the measured pulse-response characteristics. This switching time is limited by the LED; the FET and isolation layers do not affect the switching behavior of the circuit in this time frame. 21 refs.

**074402 OPTOELECTRONIC INTEGRATED CIRCUITS.** The demand for optoelectronic integrated circuits (OEICs) is argued to be driven by the need for more sophisticated, second-generation photonic systems such as optical interconnects, optical computing, and optical communications. All of these systems require certain generic, or building-block components, which include optical transmitters, receivers, modulators, and arrays of all of these various devices. In the hierarchical arrangement of systems and devices considered, it is pointed out that the foundation of the hierarchy is the materials growth technology. Therefore, a brief description is also given of the materials growth techniques which are used in OEIC structures. 35 refs.

Forrest, Stephen R. (Univ of Southern California, Los Angeles, CA, USA). *Proc IEEE* v 75 n 11 p 1488-1497.

**074403 INTEGRATED WAVEGUIDE P-I-N PHOTODETECTOR.** A p-i-n photodetector in  $\text{In}_{0.53}\text{Ga}_{0.47}\text{As}/\text{InP}$  integrated at the end of a ridge waveguide in n<sup>+</sup>-InP/n<sup>-</sup>-InP is reported. In the waveguide, an average propagation loss of 3 dB/cm at 1.15  $\mu$ m was measured with a coupling loss of 2 dB and a reflection loss of 3 dB. For optical evaluation of the waveguide-detector, 1.15- $\mu$ m light from a He-Ne laser was coupled into the waveguide and the detected photocurrent was measured as a function of the input light intensity with reverse bias as a parameter. The response of the detector was linear with intensity. Typically, a photocurrent of 11  $\mu$ A was measured for an input light intensity of 56  $\mu$ W falling on the waveguide. Taking into account coupling, reflection and propagation losses, it is estimated that 85% of the guided light was absorbed by the photodetector. The device had a 3-dB bandwidth of 500 MHz when light from a 1.3- $\mu$ m semiconductor laser source was coupled into the waveguide. 1 ref.

**074404 MONOLITHICALLY INTEGRATED RECEIVER FRONT-END:  $\text{In}_{0.53}\text{Ga}_{0.47}\text{AS PIN-AMPLIFIER}$ .** A monolithically integrated  $\text{In}_{0.53}\text{Ga}_{0.47}\text{As}$  p-i-n-amplifier fabricated on n-InP substrates is discussed. The structure utilizes a vertical integration of p-i-n-diode and recessed-gate InP MISFETs, yet with a planar surface for fine-line photolithography. The preamplifier consists of a gain stage and a buffer stage, both made of InP MISFETs with aluminum phosphorus oxide as gate insulator. This is by far the most complex integrated optoelectronic circuit on InP ever reported. At 400 Mb/s, the receiver sensitivity is better than -27 dBm for 1  $\times$  10<sup>-9</sup> bit-error rate.

## Millimeter Waves

**074411 OPTOELECTRONIC MILLIMETRE-WAVE SWITCHING USING A FINLINE-ON-SILICON SUBSTRATE.** A finline-on-silicon substrate has been realized showing small insertion loss. Illuminating the slot region by an infra-red-emitting diode, considerable attenuation has been achieved. This demonstrates the high optoelectronic sensitivity of a finline structure, which is due to the high field concentration in the slot. Experimental results in the 26.5-40 GHz range are given. (Author abstract) 8 refs.

## Packaging

**074412 OPTOELECTRONIC PACKAGING.** By adding the capability of photons to electrical devices (i.e., optoelectronics), a number of performance advantages may be obtained in existing products and new applications may be developed. Exploiting this potential is not simple, however, since optoelectronic packaging must overcome a number of complexities which are not inherent in silicon devices. As a result, considerable progress must still be made in developing optoelectronic packaging technology. (Author abstract) 15 refs.

## Reviews

**074420 R&D IN III-V OPTO TECHNOLOGY.** Advanced solid-state lasers, photo-detectors, optoelectronic integrated circuits (OEICs) and microwave communication links are exploiting the unique electronic and optical properties of Group III-V semiconductor materials. Multi-layer structures necessary for creation of layers (eg GaAs/GaAlAs), photodiodes (eg InGaAs/InP) or more complex devices which combine opto and digital functions within a single package are achieved using epitaxial growth processes such as metal organic chemical vapour deposition (MOCVD), vapour phase epitaxy (VPE) or molecular beam epitaxy (MBE). Significant development work associated with III-V semiconductor materials for use in optoelectronic components has already been undertaken by the major American and Japanese corporate research laboratories. The article is a short review of developments in optoelectronic technology.

## Performance

**074423 NEW DIAGNOSTIC POSSIBILITIES WITH A RETINAL MEASURING SYSTEM.** Clinical experimental studies on retinal circulation have proved that blood circulation measurements on the retina substantially expand the ophthalmologist's potential for differential diagnosis. These studies suggest that the use of corresponding measuring instruments will make possible substantial advancements in the therapy of retinal circulatory disturbances. The microcomputer-controlled retinal measuring system is part of the overall effort to develop a comprehensive circulatory measuring station. A computer-controlled measuring attachment to the RCS-310 Retinal Camera was developed. The heart of the measuring system is an optoelectronic CCD sensor arranged in one of the image planes of the measuring path of rays. 3 refs.

## ORCHARDS

### Frost Protection

**074424 DETERMINATION OF THE EFFECTIVE EMISSIVITY AND TEMPERATURE UNDER VERTICAL OBSERVATION OF A CITRUS ORCHARD. APPLICATION TO FROST NOWCASTING.** In this work Becker's model for the determination of the effective temperature and emissivity under vertical observation of a citrus orchard was used. This model was applied to the particular case of a typically radiative night cooling condition (completely clear sky and calm wind), under which radiation frosts are normally produced. This is damaging to the fruit and, consequently, to the Valencian economy. The authors determined that a citrus orchard under normal observation can, in practice, be considered as a homogeneous system as far as the emissivity is concerned and that the orange tree's influence on the effective temperature is approximately three times that of the ground. (Edited author abstract) 22 refs.

**074427 MOMENT EXERTED ON A CONING PROJECTILE BY A SPINNING LIQUID IN A SPHEROIDAL CAVITY.** Motion of a rotating inviscid liquid in a spheroidal container has been studied for some time. This inviscid theory for spheroids has been modified here by a boundary-layer correction. The resulting pressures and velocity profiles can then be used to compute liquid in-plane and liquid side-moment coefficients for various eccentricities, coning frequencies, and Reynolds numbers. In this paper, these results are discussed and compared with similar results for cylinders. 16 refs.

Murphy, Charles H. (US Army Ballistic Research Lab, Aberdeen Proving Ground, MD, USA). *AIAA J* v 25 n 12 Dec 1987 p 1631-1633.

**074428 SUBSONIC SINGLE-PHASE FLOW IN A GUN SIMULATOR.** Reported here are the time-resolved and ensemble mean and rms fluid velocities obtained by laser Doppler anemometry in a subsonic gun simulator with an inert single-phase flow and a projectile exit

velocity of 40 m/s. The results presented also include the time-resolved measurements of the projectile velocity and breech pressure. The results show that, based on measured breech-pressure record, the calculated projectile velocities are almost exactly equal to the measured values and confirm that the friction of the system is negligible. Fluid velocity traces, together with ensemble mean and rms velocity profiles, indicate the presence of a wall boundary layer occupying up to 20% of the tube radius and having a growth rate similar to that of steady turbulent boundary layers. (Edited author abstract) 12 refs.

**074429 DYNAMIC STABILITY CRITERIA OF FREE FLIGHT NO-SPINNING MORTAR PROJECTILES.** The effects of linear yawing, nonlinear damping and pitching moments on free flight no-spinning mortar projectiles are discussed in this paper. A yawing stability factor and a damping stability factor are introduced first. By these factors are described criteria that determine unexpected falling-down of free flight mortar projectiles. (Author abstract) 6 refs. In Chinese.

Dong, Liang. *Bingong Xuebao* n 1 Feb 1988 p 42-51.

**074430 RAM ACCELERATOR: A NEW CHEMICAL METHOD FOR ACCELERATING PROJECTILES TO ULTRAHIGH VELOCITIES.** A new method for accelerating projectiles from velocities of approximately 0.7 km/s up to approximately 12 km/s using chemical energy is presented in this paper. The concept, called the 'ram accelerator', is based on gasdynamic principles similar to those of an airbreathing ramjet but operates in a different manner. The projectile, which resembles the center body of a ramjet, travels through a tube filled with a premixed gaseous fuel and oxidizer mixture. The tube becomes the outer cowl of the ramjet, and the energy release process travels with the projectile. By tailoring the propellant mixture along the tube, a nearly constant acceleration can be achieved. In principle, the ram accelerator can be scaled for projectile masses ranging from grams to hundreds of kilograms and is capable of ballistic efficiencies as high as 30%. A straightforward, quasisteady, one-dimensional approach is used to model the acceleration process. (Edited author abstract) 15 refs.

**074432 SEA LANCE WEAPON DEVELOPMENT - SYSTEM AND NAVAL ENGINEERING ASPECTS OF THE CAPSULE.** The developmental Sea Lance Weapon System is an encapsulated supersonic standoff ant submarine warfare missile, launched from an attack submarine torpedo tube. The buoyant capsule rises to the surface, broaches, the forward closure separates, and the rocket motor ignites, powering the missile and payload from the capsule to the target coordinates. This paper emphasizes the system engineering and naval engineering aspects of the Sea Lance capsule, a lightweight high strength composite material pressure hull. Performance, environmental and interface requirements were identified

to which analyses and comparisons were made. (Edited author abstract) 5 refs.

## Mathematical Models

**074437 ON THE OPTIMAL BURST HEIGHT AND BURST HEIGHT DISPERSION OF ANTIPERSONNEL HE PROJECTILES.** Based on an analysis of quantity relations between the burst height, high burst dispersion and the lethal area, this paper develops a mathematical model for determining the optimal burst height of HE projectiles and the high burst dispersion. Air burst HE projectiles are mainly used to fire at personnel in trenches. A formula for calculating the impact area of an infantryman in standing position in a trench is

presented, the method to calculate the lethal area is discussed, and results of a number of projectile types are obtained. (Author abstract) 2 refs. In Chinese.

**074445 QUANTITATIVE DETERMINATION OF HEMATITE AND GOETHITE IN LATERITIC BAUXITES BY THERMODIFFERENTIAL X-RAY POWDER DIFFRACTION.** An X-ray thermodifferential powder diffraction method for the quantitative determination of goethite and hematite in lateritic bauxites has been developed and consists of measuring the integrated intensities of the 012 line of hematite before and after heating the sample at 900°C and of correcting the obtained values by the X-ray mass absorption coefficient of either the untreated or heated matrix. From the corrected line intensities and the chemical analyses, the amounts of iron to be allocated to goethite and hematite in the untreated samples can be estimated. The actual content of goethite and hematite in a sample is calculated by taking into account the degree of Al substitution in each of these minerals. The method was tested on artificial mixtures of goethite and hematite and subsequently used to analyze 98 auger drill samples from lateritic bauxites of Guinea Bissau. The estimated precision of the determination of goethite and hematite content was ±2% (absolute). The method can not be applied to samples containing <10% Fe<sub>2</sub>O<sub>3</sub> (on a whole weight basis) unless preconcentration is carried out. (Author abstract) 14 refs.

**074446 CORRELATION BETWEEN THE CONTENTS OF A USEFUL COMPONENT IN THE ORE STREAM AND ITS INFLUENCE ON THE RESULTS OF EXTRACTED ORE TESTING AND SORTING.** Studies with large-portion testing (LT) and large-portion sorting (LS) of extracted ore of radioactive, rare, and nonferrous metals by radiometric and nuclear physical methods have been done to determine the source of substantial discrepancies between the calculated and actual LT errors and to determine the complex relationship between the yield of tails in LS and the principal factors. The author has developed a simple and transparent technique which evaluates the degree of a trend in the contents and at the same time estimates the ore enrichability by large-portions sorting and the dependency of its

characteristics on the volume of the portions being sorted. 7 refs.

## Spectroscopic Analysis

**074447 ELECTRON PARAMAGNETIC RESONANCE STUDY OF CRYSTAL LATTICE SILVER IN GALENA.** The authors studied the silver in galena by means of electron paramagnetic resonance (EPR) for the first time. The results show that there is a fine structure line of the Gauss type in the spectrum. It is demonstrated that crystal lattice silver occurs in galena. In addition, the authors explained why this line had been generated and computed the concentration of lattice silver by contrasting this line with the intensity of the fine structure line. A new method has been provided for studying the occurrence of lattice silver in galena or in other sulfides. (Edited author abstract) 3 refs. In Chinese.

**074448 NEAR-INFRARED REFLECTANCE ANALYSIS OF IRON ORES.** Near-infrared reflectance analysis (NIRA) has been applied to the rapid characterization of mineral samples. A suite of 82 West Australian iron ores was used to carry out the work. Approximately half the samples, chosen randomly, were used as a calibration set, while the remaining samples formed a prediction test set. Correlations were sought for eight of the significant practical properties of the samples. These properties were major element analysis, combined water, relative density, and goethite concentration. Reasonably close correlations were obtained for most of the properties, except silicon, although the estimated prediction errors were worse than those obtained with conventional methods. (Edited author abstract) 12 refs.

**074450 CHANGES IN DISPERSION VARIANCE CONSEQUENT UPON INACCURATELY MODELLED SEMI-VARIOGRAMS.** The semi-variogram function which describes the spatial variation of samples as a function of their distance apart is an intermediary in geostatistical calculations. It is used in the calculation of several variances: the estimation variance which quantifies the accuracy of block estimates and the dispersion variance which measures the variability of blocks in the deposit. However the semi-variogram must be accurately modeled if these variances are to be well-known. The changes in dispersion variance calculated here when a spherical semi-variogram is estimated inaccurately show the need for care in its estimation, especially in the selection of the correct nugget effect. (Author abstract) 7 refs.

## Alaska

**074451 GEOLOGY, GEOCHEMISTRY, AND TECTONIC SETTING OF THE KHAYYAM AND STUMBLE-ON MASSIVE SULFIDE DEPOSITS, PRINCE OF WALES ISLAND, ALASKA.** The purpose of this study is to define the nature and origin of the massive sulfide deposits, including their tectonic setting within the Wales metamorphic suite. The study is based on reconnaissance mapping in the Wales metamorphic suite of central Prince of Wales Island and on detailed mapping at scales of 1:5,000 in the vicinity of the deposits and 1:500 at the mine sites. The mapping concentrated on host-rock lithologies south of the deposits where there is excellent exposure. The petrology and geochemistry of the host rocks, including the unusual wall-rock lithologies, have been studied using standard petrographic, microprobe, X-ray fluorescence, and neutron activation techniques, and the ore mineralogy has been investigated using reflected light microscopy, X-ray diffractometry, and the scanning electron microscope. 60 refs.

**074452 MINERAL AND WHOLE-ROCK COMPOSITIONS OF SEAWATER-DOMINATED HYDROTHERMAL ALTERATION AT THE ARCTIC VOLCANOGENIC MASSIVE SULFIDE PROSPECT, ALASKA.** The Arctic volcanogenic massive sulfide prospect, located in the Ambler mineral district of northwestern Alaska, includes three types of hydrothermally altered rocks overlying, underlying, and interlayered with semimassive sulfide mineralization. Hydrothermal alteration of wall rocks and deposition of sulfide and gangue minerals were contemporaneous with Late Devonian or Early Mississippian basalt-rhyolite volcanism. Whole-rock analyses of altered rocks surrounding the prospect indicate that strong chemical gradients exist in major and minor oxides and volatiles. Alteration developed asymmetrically around a linear fissure, suggesting fracture control of ore fluids rather than a point source. Microprobe analyses of phyllosilicates from the Arctic area indicate two discrete mineral populations. Magnesian chlorite, barian white mica, and barian fluorophlogopite in hydrothermally altered rocks have compositions distinct from similar minerals (chlorite, phengite, biotite) developed during high-pressure metamorphism in metapelitic and metavolcanic lithologies. These differences in mineral chemistry are the result of differences in protolith composition caused by hydrothermal alteration-metasomatism. (Edited author abstract). 36 Refs.

Schmidt, Jeanine M. (US Geological Survey, Anchorage, AK, USA). *Econ Geol Bull Soc Econ Geol* v 83 n 4 Jun-Jul 1988 p 822-842.

## Analysis

**074453 GENETIC AND EXPLORATION SIGNIFICANCE OF THE ZINC RATIO (100 Zn/(Zn+Pb)) IN MASSIVE SULFIDE SYSTEMS.** Comparison of the 100 Zn/(Zn+Pb) ratio ('zinc ratio') of various styles of mineralization in the Mount Read Volcanics of Tasmania indicates that volcanogenic massive sulfide deposits have a restricted range of mean values (60-77) and low standard deviations (less than 15) whereas other mineralization styles have a broader but lower range of mean values (39-61) and higher standard deviations (greater than 26). Thermochemical calculations on lead and zinc transport in saturated ore solutions show that the solution zinc ratio is controlled only by temperature and salinity and is independent of pH,  $I_{O(2)}$ , and activity of dissolved sulfur. Variations in the zinc ratio between individual massive sulfide deposits in the Mount Read Volcanics indicate that lead-zinc saturation of the ore solution rather than lead-zinc content in the footwall volcanic source rocks was the major control on the zinc ratio of the deposits. The characteristics zinc ratio of volcanogenic massive sulfide-style mineralization can be used to distinguish these deposits from other mineralization types in the Mount Read Volcanics. Effective use of this simple technique requires a reasonable number of anomalous samples and an unoxidized sample medium. Additional aspects of the subject and its application significance are discussed. (Edited author abstract) 40 refs.

**074454 UNDERGROUND MAPPING AND COMPUTER ESTIMATION OF ORE RESERVES.** This paper traces the involvement of the mine surveyor with ore estimation procedures from the days when the art was simply a matter of sample lengths and assays being converted into tonnage and grade to the present time where an apparently highly sophisticated program approach is used. The author suggests that there is a tendency to accept that these computer-based methods have resolved all the problems of resource evaluation. It is easy to gain the impression that such programs have already taken into account errors in geological input, drill core data, sampling methods, volumes, assays, etc. (Author abstract)

Cooper, Graham H. (DDIAE, Aust). *Aust Surv* v 33 n 8 Dec 1987 p 718-730.

**074455 TIME OF MINERALIZATION IN THE EVOLUTION OF THE McDERMITT CALDERA COMPLEX, NEVADA-OREGON, AND THE RELATION OF MIDDLE MIOCENE MINERALIZATION IN THE NORTHERN GREAT BASIN TO COEVAL REGIONAL BASALTIC MAGMATIC ACTIVITY.** This paper focuses on the relationship between Neogene hydrothermal activity and mineralization in the northern Great Basin and coeval magmatic activity. New data show that mineralization at the McDermitt mercury mine is closely related to major stages of evolution of the McDermitt caldera complex. On a regional scale, the authors emphasize the very close association in time between mineralization and a major pulse of middle Miocene basaltic and basalt-related volcanism. The spatial and temporal associations in conjunction with evidence for elevated initial gold contents of mafic rocks and their intermediate composition differentiates suggest that such rocks must be considered as possible sources for the gold in the various epithermal and hot springs deposits of the region. 52 Refs.

Noble, Donald C. (Univ of Nevada-Reno, Reno, NV, USA); McCormack, John K.; McKee, Edwin H.; Silverman, Miles L.; Wallace, Andy B. *Econ Geol Bull Soc Econ Geol* v 83 n 4 Jun-Jul 1988 p 859-863.

## Arizona

**074456 STRUCTURAL REINTERPRETATION OF THE AJO MINING DISTRICT, PIMA COUNTY, ARIZONA, BASED ON PALEOMAGNETIC AND**

**GEOCHRONOLOGIC STUDIES.** The Ajo mining district of southern Arizona is divided into two main structural blocks by the Gibson Arroyo fault. Paleomagnetic and geologic evidence indicates that the ore deposit has been tilted to the south a total of approximately 120°: 68° before and another 55° after emplacement of the overlying Locomotive Ganglomerate and Ajo Volcanics. Paleomagnetic directions are consistent with the southward tilting of the volcanic rocks, but they suggest that the remanent magnetization and perhaps the K-Ar dates of the western intrusion were reset by the emplacement of dikes younger than the Locomotive Ganglomerate and Ajo Volcanics. These and other geologic relations indicate a sequence of mid-Tertiary events in the district, which the paper discusses. (Edited author abstract) 22 refs.

Hagstrum, Jonathan T. (US Geological Survey, Menlo Park, CA, USA); Cox, Dennis P.; Miller, Robert J. *Econ Geol Bull Soc Econ Geol* v 82 n 5 Aug 1987 p 1348-1361.

**074457 RELATIONSHIPS BETWEEN A PORPHYRY Cu-Mo DEPOSIT, BASE AND PRECIOUS METAL VEINS, AND LARAMIDE INTRUSIONS, MINERAL PARK, ARIZONA.** In the Wallapai mining district, porphyry-style copper-molybdenum mineralization occurs within and near Laramide granitoid stocks at the center of an elongate zone of polymetallic quartz veins. The principal mineralized veins form a well-defined paragenetic sequence, with a simplified mineralogy progressing through a variety of minerals. The coexistence of vapor- and liquid-rich fluid inclusions in vein quartz shows that the molybdenite-bearing anhydrite and quartz veins formed at 360 to 410°C from boiling, low-salinity brines. Copper and molybdenum mineralization occurred in a lithocap environment above a progenitor intrusion but was not directly related to the exposed Ithaca Peak stocks. The evolution from hypersaline fluids in the anhydrite-chalcocopyrite veins to low-salinity, lower temperature fluids in the quartz-pyrite veins suggests an influx of meteoric water. Brines up to 100°C hotter appeared during the formation of the paragenetically later polymetallic quartz veins and constituted a new, and much larger, hydrothermal system. (Edited author abstract). 50 Refs.

Lang, James R. (Univ of Arizona, Tucson, AZ, USA); Eastoe, Christopher J. *Econ Geol Bull Soc Econ Geol* v 83 n 3 May 1988 p 551-567.

## Australia

**074458 DISTRICT-SCALE ALTERATION ASSOCIATED WITH MASSIVE SULFIDE DEPOSITS IN THE MOUNT READ VOLCANICS, WESTERN TASMANIA.** The distribution of secondary mineral assemblages in six mineralized areas of the Mount Read Volcanics defines a district-wide zonation which is sub-conformable with massive sulfide host horizons and the contacts of sill-like granitoids where present. The relationships between alteration patterns and elements of Cambrian geology strongly suggest that the alteration is related to Cambrian hydrothermal circulation responsible for massive sulfide mineralization. There is a later greenschist facies metamorphic overprint. Chlorite compositions preserve local patterns due to Cambrian hydrothermal processes, but they do not vary systematically with alteration assemblages throughout the province. Chlorite Mg to Fe ratios appear to have been preserved through metamorphism. A combination of structural and alteration data is useful to mapping in the Mount Read volcanics. Study results are discussed. 54 refs.

## California

**074459 PERMIAN KUROKO-TYPE HYDROTHERMAL SYSTEM, AFTERTHOUGHT-INGOT AREA, SHASTA COUNTY, CALIFORNIA: LATERAL AND VERTICAL SECTIONS, AND GEOCHEMICAL EVOLUTION.** The Afterthought and smaller kuroko deposits in the East Shasta mining district formed at the culmination of a late Permian mafic to felsic

volcanic cycle. They were succeeded by Triassic clastic sediments and reworked tuff in a presumed rifting environment with local evidence of renewed mafic volcanism and large-scale slumping. The Afterthought host horizon is repeated in an outcrop by folding. The kuroko deposits comprise three ore types: A: banded, fine-grained sulfides and gangue; B: recrystallized, coarser grained sulfides and gangue with a consistent paragenetic sequence; and C: coarse-grained pyrite and barite. B and C appear to replace type A. A further type of mineralization, type D, consists of fine-grained pyrite occurring locally within silicified dacite on the Afterthought host horizon. The paragenetic sequence of type B implies a sequential introduction of metals in a fluid evolving toward higher  $H_2S$  activity. Cu was introduced early as chalcopyrite and bornite; later fluids altered preexisting Cu minerals rather than introducing significant new Cu. The last type B fluids dissolved much base metal sulfide and deposited calcite, quartz, and sericite. (Edited author abstract). 43 Refs.

Eastoe, C.J. (Univ of Arizona, Tucson, AZ, USA); Nelson, S.E. *Econ Geol Bull Soc Econ Geol* v 83 n 3 May 1988 p 588-605.

## Chile

**074460 GEOLOGIC AND METALLOGENIC SIGNIFICANCE OF THE ISOTOPIC COMPOSITION OF LEAD IN GALENAS OF THE CHILEAN ANDES.** Galenas from deposits hosted by pre-Jurassic to Jurassic rocks are relatively enriched in radiogenic Pb, reflecting the involvement of old crustal Pb. Galenas from Lower Cretaceous-hosted deposits are less radiogenic and may reflect a mantlelike component. Those from Tertiary rocks are isotopically more variable, reflecting the influence of a more evolved crust. There is no obvious correlation between the isotopic composition of the galena leads and the age of the hydrothermal event that gave rise to the particular mineral deposit (when such ages can be determined from independent geologic evidence). It is concluded that the galena leads were derived from a mixture of different lead reservoirs. The correlation of isotopic composition with age of host rocks suggests either that the concentration of lead to form galena was more or less contemporaneous with the formation of the host rock or that the galena lead was essentially derived from the country rocks and inherited their original isotopic signature. (Edited author abstract). 48 Refs.

## Colorado

**074461 GENESIS OF ACID-SULFATE ALTERATION AND Au-Cu-Ag MINERALIZATION AT SUMMITVILLE, COLORADO.** The Summitville Au-Cu-Ag deposit occurs within a porphyritic quartz latite, primarily in a zone of 'vuggy silica' alteration characterized by leaching of all major elements except silica and iron. Vuggy silica is best developed between an elevation of 3,700 and 3,500 m where it occurs in irregular pipes and lenticular pods up to 70 m wide and is enclosed by up to 30 m of intense quartz-alunite alteration. Sulfide mineralization occurs primarily within the vuggy silica. Consideration of alunite, kaolinite, and pyrite stability relations and of aluminum speciation at 250°C indicates that a pH of 2 or below and a  $\log f_{O_2}$  of  $-31 \pm 1$  (at 250°C) were necessary to produce vuggy silica alteration. Textural and geochemical relationships indicate that sulfide and gold mineralization postdate the formation of vuggy silica alteration in the deposit and are not directly related to the highly acidic solutions necessary for this early acid-leaching event. Additional study results and conclusions are discussed. (Edited author abstract) 60 refs.

## Exploration

**074462 EVALUATING THE MORPHOLOGICAL CHARACTERISTICS OF ORE DEPOSITS IN PROSPECTING CROSS SECTIONS.** The results of the studies described in this paper have made it possible to establish a dependence of the errors of the main metric characteristics of contours determined from a relatively sparse network of intersections on the distance between the intersections and the methods of contour mapping employed. The presence of this dependence precludes the use of the ratio of the ore contour perimeter to the ore area to estimate the morphological features of mineralization in prospecting cross sections when it is determined from a sparse prospecting network. Therefore, it is advisable to use only data obtained on sampling detailization sections where the distances between the cross sections are no less than 20 m. In Russian. 5 refs.

**074463 DETERMINATION OF W AND Mo IN NATURAL SPRING WATERS BY ICP-AES (INDUCTIVELY COUPLED PLASMA ATOMIC EMISSION SPECTROMETRY) AND ICP-MS (INDUCTIVELY COUPLED PLASMA MASS SPECTROMETRY): APPLICATION TO SOUTH NAHANNI RIVER AREA, N.W.T., CANADA.** The relative merits of analyzing fresh and saline waters for W and Mo by inductively coupled plasma-atomic emission spectrometry (ICP-AES) and ICP-mass spectrometry (ICP-MS) have been examined. A preconcentration step via adsorption of Cretaceous the analysis onto activated charcoal is mandatory in analysis by ICP-AES in order to achieve practical detection limits of  $1.2 \mu\text{g L}^{-1}$  for W and  $0.4 \mu\text{g L}^{-1}$  for Mo. This step is also necessary in analysis by ICP-MS for water high in total dissolved salts ( $> 1000 \text{ mg L}^{-1}$ ). Application of this procedure results in detection limits of  $0.06 \mu\text{g L}^{-1}$  for both elements, based on a 100-mL sample volume. The above methods were applied to 41 samples of waters taken from thermal, cold and iron-rich springs in the South Nahanni River area. Four distinctly anomalous sites (22  $15 \mu\text{g L}^{-1}$  W) are hot springs spatially associated with Cretaceous granites, and three of these are in the vicinity of known scheelite-bearing skarns or wolframite occurrences. The remainder of the sites, located in folded and faulted sedimentary rocks as well as granites, produced waters with W and Mo abundances at or below detection limits. **074464 INTEGRATING SPATIAL AND FREQUENCY INFORMATION IN THE SEARCH FOR KUROKO DEPOSITS OF THE HOKUROKU DISTRICT, JAPAN.** A new method (FINDER) that uses the area of influence and Bayesian statistics to aid in selection of target areas on the basis of one or more variables and multiple observations was tested with drill hole data. A previously defined bimodal distribution of  $\text{Na}_2\text{O}$  with the low sodium group confined to a  $1.5 \times 3.0\text{-km}$  zone beneath the cluster of deposits at Fukazawa was used as a control area for one test of FINDER. Using the  $\text{Na}_2\text{O}$  means and standard deviations for the control area and minimum  $\text{Na}_2\text{O}$  values from 174 drill holes, a probability map of centers of sodium depletion is produced for the Hokuroku district. High probability areas correspond to the known deposits that should have been rediscovered and to several areas without known deposits. Use of X-ray data from 165 drill holes, some of which also have chemical analyses, led to the identification of two additional variables, sericite and gypsum plus anhydrite, that allow more drill holes to be used and that expand the areas of influence around drill holes. **074465 FIELD, ISOTOPIC, AND CHEMICAL STUDIES OF TOURMALINE-BEARING ROCKS IN THE BELT-PURCELL SUPERGROUP: GENETIC CONSTRAINTS AND EXPLORATION SIGNIFICANCE FOR SULLIVAN TYPE ORE DEPOSITS.** The Sullivan Pb-Zn-Ag massive sulphide deposit (located in the mid-Proterozoic Belt-Purcell Supergroup near Kimberley, British Columbia) is associated with a large tourmalinite alteration zone. A petrologically similar, but barren, alteration zone has recently been discovered at Trestle Creek, Idaho. Because of the importance of the Sullivan deposit, several methods of exploration involving tourmaline have recently been proposed in the literature. To test these proposals, the authors compared the alteration zone at Sullivan (using literature data) with that at Trestle Creek. The two areas can clearly be distinguished using Mg content in tourmaline and  $\delta^{18}\text{O}$  in albite, can probably be distinguished using  $\delta^{18}\text{O}$  in tourmaline-bearing rocks, but cannot be distinguished using alteration mineralogy alone. In addition we found that tourmaline occurs in at least eight different geologic settings in the Belt-Purcell Supergroup. Additional aspects of the subject are discussed. (Edited author abstract) 35 refs.

**074466 ORE DEPOSIT MODELS #14. VOLCANOGENIC MASSIVE SULPHIDE DEPOSITS. PART 2: GENETIC MODELS.** Characteristics of volcanogenic massive sulphide VMS deposits were described in Part 1 of this article. Discussion here is limited to those processes and related geological aspects that have been of the most concern in the recent literature. These include: (i) processes of sulphide accumulation which form the massive sulphide lens and which in turn control the morphology, texture, mineralogical zonation, etc. of the sulphide body; (ii) processes in the immediate footwall of proximal VMS deposits that give rise to the hydrothermal alteration pipe and stockwork ore; (iii) reasons for fluid flow in the hydrothermal system, which in turn help explain the geological setting and distribution of VMS deposits; and (iv) origin and nature of the hydrothermal fluids, which in turn determine the source of the ore constituents and the chemistry of the sulphide ores. 197 Refs.

## Finland

**074467 GEOMETRY OF SHEATH FOLDS AND RELATED FABRICS AT THE LUIKONLAHTI MINE, SVEVOKARELIDES, EASTERN FINLAND.** The Luikonlahti Cu-Co-Zn sulfide ore deposit is hosted by metasediments associated with serpentinites in the 1.97 Ga old Outokumpu assemblage in the Svevokarelidides of eastern Finland. Polyphase deformation of the host rocks, a history shared by the ore body, includes a phase of sheath fold propagation. A modified vergence rule, utilizing only the intersection geometry of planar fabric elements, permits recognition of these extremely curvilinear folds in poorly exposed terrain. The detailed geometry of these rocks is independently resolved from borehole and underground stope records. Sheath fold propagation occurred during D<sub>2</sub>, the second phase of regional deformation. In the Kaavi district D<sub>2</sub> major structures are either thrusts or thrust-related. The Luikonlahti sheaths are located in a steeply dipping shear zone formed during this deformation episode. (Author abstract). 20 Refs.

## Geochemistry

**074469 COMPOSITION AND ACTIVITY OF SULFUROUS SPECIES IN QUENCHED MAGMATIC GASES ASSOCIATED WITH PYRRHOTITE-BEARING SILICIC SYSTEMS.** Study of pyrrhotite-bearing volcanic units such as the El Chichon, St. Helens, and Fish Canyon tuffs demonstrates that the activity of sulfurous gases in calc-alkaline systems is often quite high. Oxidizing systems have especially high activities of  $\text{SO}_2$  in early volatile phases. Upon cooling, oxidized compositions react to form sulfate-rich solutions through the reactions  $4\text{SO}_2 + 4\text{H}_2\text{O} = 3(\text{H}_2\text{SO}_4) + \text{H}_2\text{S}$  whereas reduced compositions from hydrogen sulfide-rich solutions by the reaction  $\text{SO}_2 + 3\text{H}_2 = \text{H}_2\text{S} + 2\text{H}_2\text{O}$ . In both cases, the quenched magmatic component is high in total sulfur content and possesses high oxygen and sulfur fugacities. The high sulfate content, either inherited directly from the reaction of magmatic gases or derived from the oxidation of magmatic  $\text{H}_2\text{S}$  by meteoric waters, may be an important component for the transport of certain ore-forming elements. The conditions derived from these calculations duplicate those determined from natural magmatic-dominated systems such as Summitville, Colorado. (Edited author abstract) 31 refs.

**074470 SULFUR ISOTOPE VARIABILITY IN SEDIMENT-HOSTED MASSIVE SULFIDE DEPOSITS AS DETERMINED USING THE ION MICROPROBE SHRIMP: I. AN EXAMPLE FROM THE RAMMELSBERG OREBODY.** Ores from weakly or unmetamorphosed stratiform or strata-bound massive sulfide deposits such as Rammelsberg, Kuroko, or Mount Isa, are fine grained and texturally complex, containing multiple generation of minerals. Understanding the timing of and process involved in, their formation has remained a formidable task. In situ ion microprobe analytical techniques have been developed to circumvent some of the difficulties involved in sample purification necessary for conventional sulfur isotope determinations and allow concurrent examination of ore textural and isotopic characteristics on a scale as small as  $20\ \mu\text{m}$ . Though the interpretation of the nature and timing of ore depositional processes at Rammelsberg has not been aided by the ambiguous morphological characteristics of individual clasts, the sulfur isotope signatures of the minerals, as well as inter- and intraclast textural relationships which remain undisturbed through in situ analyses, may be quite useful as guides to key issues as the dependence of ore formation on the presence of biogenic sulfide. 28 refs.

**074471 CHEMICAL CONTROLS ON THE SOLUBILITY, TRANSPORT, AND DEPOSITION OF PLATINUM AND PALLADIUM IN HYDROTHERMAL SOLUTIONS: A THERMODYNAMIC APPROACH.** Thermodynamic calculations of the solubility of Pt and Pd up to  $300^\circ\text{C}$  using isocoulombic extrapolation, the correspondence principle, linear free energy relationships, and the theory of stepwise ligand replacement indicate that, depending on physicochemical conditions, complexation by either  $\text{OH}^-$ ,  $\text{HS}^-$ , or  $\text{Cl}^-$  can

contribute to the transport of these metals in hydrothermal solutions. These calculations suggest that Pt and Pd may be mobile in a variety of environments. In kupferscheifer-type ore-forming fluids they could be transported as chloride complexes. The lack of acidic alteration and oxidized mineral assemblages in hydrothermal Pt and Pd occurrences in shear zones in metagabbroic rocks, such as those at New Rambler, Wyoming, and Rathbun Lake, Ontario, preclude Pt and Pd transport as chloride complexes during formation of these deposits. In these cases, bisulfide and/or hydroxide complexes are more likely responsible for precious metal transport. (Edited author abstract). 86 refs.

## Greece

**074472 GENESIS OF NICKEL LATERITES AND BAUXITES IN GREECE DURING THE JURASSIC AND CRETACEOUS, AND THEIR RELATION TO ULTRABASIC PARENT ROCKS.** Nickel laterites and bauxites, including their proposed parent rocks from the Mesozoic of Greece, have been investigated by means of mineralogical and geochemical methods. The results are discussed in order to recognize the genetic sequence which comprises: pre-lateritic alteration and reworking of ophiolites and associated rocks, lateritic in-situ weathering, reworking and redeposition of the alteration products in a epicontinental transition environment, and post-depositional events affecting the mineralogical and geochemical properties. The ultramafic massifs of the Euboea and Locris area, i.e., the parent rocks of the Ni-Fe deposits, are primarily harzburgites which represent the erosional outliers of a probable 'complete' ophiolitic nappe that were transformed to a monomineralic lizardite. Xenoliths of basic and sedimentary rocks are included in the serpentine matrix of the basal tectonic melange. (Edited author abstract) 66 refs.

## Illinois

**074473 STRONTIUM ISOTOPE GEOCHEMISTRY OF FLUORITE, CALCITE, AND BARITE OF THE CAVE-IN-ROCK FLUORITE DISTRICT, ILLINOIS.** In this study, strontium isotopes have been used to constrain the number and possible sources of the ore-forming fluid(s) at the Cave-in-Rock district. Because minerals like fluorite, calcite, and barite have very low Rb/Sr ratios and there is no fractionation in the strontium isotopes during mineral precipitation, the  $^{87}\text{Sr}/^{86}\text{Sr}$  ratios of these hydrothermal minerals should be a measure of the isotopic composition of the mineralizing fluids. Previous work sets a framework for the strontium isotope signatures of deposits that are also thought to be formed by basinal brines. 30 refs.

## Microanalysis

**074476 APPLICATIONS OF PROTON AND NUCLEAR MICROPROBES IN ORE DEPOSIT MINERALOGY AND METALLURGY.** The micro-PIXE technique usefully complements the analytical capabilities of the electron microprobe in many investigations of ore deposit mineralogy and metallurgy. Unfortunately, micro-PIXE has not been widely used, largely because of a paucity of accessible proton/nuclear microprobes designed with sample- and data-handling facilities suitable for mineralogical targets. Ore deposit mineralogy studies are performed to achieve a wide range of objectives: from the identification of parameters useful for mineral exploration through an understanding of the genesis of ore deposits to a complete characterization of the minerals, necessary to provide guidance for mineral beneficiation and metal extraction. The specific requirements for an ideal proton microprobe for mineral analyses are discussed. In addition, new analytical data are presented for sulfide minerals (troilite and entlandite), an oxide mineral (chromite), and for copper anodes. (Edited author abstract) 36 refs.

## Missouri

**074477 DISTRIBUTION OF SELECTED ELEMENTS IN THE SHALE OF THE DAVIS FORMATION, BUICK MINE AREA, VIBURNUM TREND, SOUTHEAST MISSOURI.** Ninety-five shale samples from drill holes that intersected the base of the Davis shale as well as a drill hole that cored the entire section of the formation were collected and analyzed for 26 elements by neutron activation. It was found that ore-forming and related solutions had produced a broad zone of enrichment at the base of the Davis shale that, for some elements, extends up to 0.5 and 1.0 km west and east of the ore zones, respectively. These data suggest that the shale of the Davis Formation may have acted as a sink and subsequently a source for Na, K, Mn, Fe, and Zn, as well as a sink for As. Episodic mineralization and leaching are believed to be responsible for the initial enrichment and subsequent removal of these elements in the Davis shale. The enrichment zone at the 'base of the Davis shale, best delineated by Fe and Zn, is laterally extensive and could prove to be a useful guide to ore mineralization in this and other Mississippi Valley-type districts. Arsenic may be of use as an indicator of pathways taken by ore-forming and/or related solutions. (Edited author abstract) 27 refs.

## Morocco

**074478 APERCU SUR LES AMAS SULFURES MASSIFS DES HERCYNIDES MAROCAINES.** [Massive Sulfide Deposits of Moroccan Hercynian Islets]. Massive sulfide deposits located on Hercynian islets of northwestern Morocco exhibit four main characteristics. They are strata bound massive pyrrhotite deposits mined for sulfur and/or base metals occasionally occurring as sulfides of workable grade. Volcanic rocks with which these massive sulfide orebodies are associated are scarce, although always present as acid flows of submarine emissions of either rhyolitic or more often quartz-keratophytic nature. Stockworks underlying the massive sulfide orebodies are common, but not systematic. Associated alterites and exhalites belong to three types, i.e., sericitite (or biotite-rich rock), chloritite, and/or chert (jasper). These volcano-sedimentary deposits exhibit distal features with regard to the volcanism coeval with their sedimentation. They are mostly linked with strongly reducing environmental properties entailing pyrrhotite and/or magnetic syngenetic deposition, whatever the iron activity. (Edited author abstract) In French. 23 refs.

## New Brunswick

**074479 STOCKWORK TUNGSTEN (SCHEELITE)-MOLYBDENUM MINERALIZATION, LAKE GEORGE, SOUTHWESTERN NEW BRUNSWICK.** Scheelite-molybdenite stockwork mineralization constitutes one component of the Lake George polymetallic (Sb-W-Mo-Au-base metal) deposit, a complex hydrothermal center of Late Silurian (ca. 412 m.y.) age in the Fredericton trough of the northern Appalachians. The W-Mo deposit comprises three different scheelite-and/or molybdenite-bearing veinlet types. In both type 1 and 2 systems, scheelite and molybdenite deposit appears to have been controlled by decreasing temperature and increasing pH. Temperature was a function of distance from the cupola for both veinlet types, but the controls on pH were specific to each. Thus, the pH of type 1 fluids was controlled by wall-rock interaction (H metasomatism), whereas that of type 2 fluids was controlled by CO<sub>2</sub> effervescence. The economic stibnite-quartz veins occupy fractures which transect, and therefore, postdate all stages of W-Mo mineralization. (Edited author abstract) 76 refs.

## Newfoundland

**074481 ISLE AUX MORTS PROSPECT: THE FIRST SIGNIFICANT BASE METAL DISCOVERY IN THE PORT AUX BASQUES COMPLEX OF**

**SOUTHWEST NEWFOUNDLAND.** The Isle aux Morts Prospect is the first polymetallic, sulfide mineralization reported from the Port aux Basques Complex of southwest Newfoundland, Zn-Pb-Cu-Ba-Ag mineralization hosted by quartz-muscovite semipelitic occurs at the contact between a quartzofeldspathic unit and pelitic unit with intercalated amphibolite. Ore minerals comprise sphalerite-galena-chalcocopyrite in order of decreasing abundance. The principal gangue minerals are quartz, muscovite, feldspar and barite. Three morphologic types of mineralization are present: massive with more than 50% sulfide, flanked on one or both sides by disseminated and/or banded types. (Edited author abstract) 55 refs.

O'Neill, Pat P. (Dep of Mines and Energy, St. John's, Newfoundland, Can); Strong, D.F. *CIM Bull* v 18 n 910 Feb 1988 p 59-68.

## Nonmetallic

**074482 ORIGIN OF DIASPORE AND PYROPHYLLITE IN THE FOXTRAP PYROPHYLLITE DEPOSIT, AVALON PENINSULA, NEWFOUNDLAND: A REINTERPRETATION.** The Foxtrap pyrophyllite mine is the only commercial source of pyrophyllite in Canada. It is situated on the Avalon peninsula of Newfoundland within a belt of late Precambrian rocks of the Avalon zone. The rocks in which the pyrophyllite deposit occurs belong to the Harbour Main Group and consist predominantly of a northerly trending belt of rhyolitic flows and pyroclastics (the Harbour Main volcanics), with a minor sedimentary component. In the central part of the Avalon peninsula the Harbor Main volcanics have been intruded by a shallow-level composite granitoid pluton, the Holyrood batholith. This paper presents a new interpretation for the origin of diaspore and pyrophyllite in the Foxtrap deposit, consistent with the textures and assemblages of minerals documented by V.S. Papezik and H.F. Keats (1976). 12 refs.

## Ontario

**074485 GENERATION OF A MAGMATIC H<sub>2</sub>O-CO<sub>2</sub> FLUID ENRICHED IN Mo, Au, AND W**

**WITHIN AN ARCHEAN SODIC GRANODIORITE STOCK, MINK LAKE, NORTHWESTERN ONTARIO.** The 1.5×3.25-km Mink Lake intrusion located approx. 110 km northeast of Red Lake, northwestern Ontario in the Uchi-Conederation Lakes greenstone belt is an unmetamorphosed and postductile deformation Archean stock. The most important MoS<sub>2</sub> mineralization (grab samples with approx. 0.1-0.3%Mo) occurs in a 1,000×350-m zone completely contained within the south end of the intrusion and spans a silicate melt-hydrothermal fluid transition. Spatially distributed Rb, TiO<sub>2</sub>, Zr, and Li data (n=47) show that the main MoS<sub>2</sub>-mineralized zone is located in moderately differentiated material immediately adjacent to the principal internal zone of crystal fractionation, and in part, laterally continuous with it. It is concluded that the Mink Lake MoS<sub>2</sub> fluids were magmatically derived from the host sodic granodiorite stock. These and other aspects of the subject are discussed. 90 refs.

Burrows, D.R. (Univ of Toronto, Toronto, Ont, Can); Spooner, E.T.C. *Econ Geol Bull Soc Econ Geol* v 82 n 7 Nov 1987 p 1931-1957.

**074486 OXYGEN ISOTOPE STUDY OF THE KIDD CREEK, ONTARIO, VOLCANOGENIC MASSIVE SULFIDE DEPOSIT: EVIDENCE FOR A HIGH <sup>18</sup>O ORE FLUID.** The hydrothermally altered rhyolites (<sup>18</sup>O = 10-16‰) at the Kidd Creek Cu-Zn-Ag-Pb volcanogenic massive sulfide deposit (Archean, Abitibi greenstone belt) are all markedly enriched in <sup>18</sup>O compared to almost all other massive sulfide deposits. A chalcocopyrite stockwork zone, forming a concordant 'keel' stratigraphically below the massive sulfide, typically has whole-rock <sup>18</sup>O = 10 to 12 per mil. Beneath the stockwork keel, rhyolite <sup>18</sup>O values systematically increase stratigraphically downward for about 50 m. Below this level, all of the footwall rhyolites in the Kidd Creek area display exceptionally high <sup>18</sup>O values of 13 to 16 per mil. Petrographically, all of the Kidd Creek footwall rhyolites are intensely altered (typically containing 76-90 wt% SiO<sub>2</sub>), indicating that the high <sup>18</sup>O characteristics are not primary magmatic features but are the result of hydrothermal alteration. These and other aspects of the subject are discussed. (Edited author abstract) 40 refs.

Beatty, David W. (California Inst of Technology, Pasadena, CA, USA); Taylor, Hugh P. Jr.; Coad, Paul R. *Econ Geol Bull Soc Econ Geol* v 83 n 1 Jan-Feb 1988 p 1-17.

**074487 PHYSICAL VOLCANOLOGY OF THE FOOTBALL ROCKS NEAR THE MATTABI MASSIVE SULPHIDE DEPOSIT, STURGEON LAKE, ONTARIO.** Subaerial and shallow subaqueous mafic hyalotuffs, lava flows, and flow breccias, felsic lava flows, and pyroclastic flows and falls form a 2 km thick succession beneath the Mattabi massive sulphide deposit. Amygdaloidal felsic lavas overlie the mafic flows and are locally capped by coarse explosion breccia. This breccia is believed to represent the start of mafic hydrovolcanism, which produced ash falls, surges, and flows. In the Mattabi area, pyroclastic flow deposits form the immediate mine footwall strata and include (i) massive basal beds and overlying bedded ash tuffs and (ii) massive pumiceous units. These deposits overlie and, to the west in the Darkwater Lake area, are intercalated with the mafic hyalotuff sequence. The morphology of the footwall volcanic rocks indicates that the Mattabi and the F-zone massive sulphide deposits formed in a shallow subaqueous environment. (Edited author abstract) 40 refs.

Groves, D.A. (Univ of Minnesota-Duluth, Duluth, MN, USA); Morton, R.L.; Franklin, J.M. *Can J Earth Sci* v 25 n 2 Feb 1988 p 280-291.

## Oregon

**074488 PRELIMINARY STUDY OF THE TURNER ALBRIGHT Zn-Cu-Ag-Au-Co MASSIVE SULFIDE DEPOSIT, JOSEPHINE COUNTY, OREGON.** The Turner Albright Zn-Cu-Ag-Au-Co deposit represents an important ophiolite-hosted (Cyprus-type) massive sulfide occurrence in the West Coast accreted terranes of the

United States. Recent exploration efforts have located an estimated 3,300,000 tons of mineralization with an average grade of 3.33 percent Zn, 1.46 percent Cu, 0.44 oz/ton Ag, 0.11 oz/ton Au, and 0.06 percent Co. The deposit occurs as a series of pods in the basal basaltic pillow lava sequence within the Josephine ophiolite complex. The mineralized horizons, known as the Main Upper and Lower zones and the Upper High-Grade pods, consist (in order of abundance) of pyrite, sphalerite, chalcopyrite, marcasite, and native gold, with minor to trace amounts of tetrahedrite, galena, arsenopyrite, and pyrrhotite. The Turner Albright deposit was formed by metal-bearing fluids generated by the circulation of seawater through a pillow basalt and sheeted dike complex within a back-arc rifting environment. These and other aspects of the subject are discussed. (Edited author abstract) 42 refs.

**Pacific Ocean** See Also MANGANESE DEPOSITS—Pacific Ocean; MINERAL INDUSTRY AND RESOURCES—Subaqueous.

**074489 HYDROTHERMAL OXIDE AND NON-TRONITE DEPOSITS ON SEAMOUNTS IN THE EASTERN PACIFIC.** Deposits of Fe oxide mud, nontronite, and Fe-Mn crusts were sampled from the summits of two seamounts in the eastern Pacific. Where low temperature (0-15°C) hydrothermal fluids are issuing, the deposits consist of X-ray amorphous Fe oxyhydroxide and are rich in Fe (43 wt.%), contain minor Si and P (4% and 3.5%, respectively), and have very low Mn (<0.01%) and other trace element contents. Other deposits, where no current hydrothermal activity was observed, consist of mud and crusts composed of amorphous material and poorly crystalline hematite, goethite, and smectite. Nontronite deposits, capped by Fe-Mn oxides, were sampled from one of the seamounts. These deposits have compositions similar to other seafloor nontronite deposits, and formed at low temperatures (30°C) during mixing of low temperature hydrothermal fluids with seawater. The oxide deposits consist almost entirely of long, delicate filaments, remarkably similar in morphology to genera of Fe oxidizing bacteria. (Edited author abstract). 34 Refs.

## Peru

**074490 OLIGOCENE MAGMATIC ACTIVITY AND ASSOCIATED MINERALIZATION IN THE POLYMETALLIC BELT OF CENTRAL PERU.** Various volcanic and intrusive rocks were dated at the Institut Dolomieu (Grenoble, France) as part of a research program. This paper deals with the part of this new data which has already been partly published that refers to metallogenetic aspects; it allows the conclusion that there have been at least two distinct periods of polymetallic mineralization in central Peru during the Oligocene and Miocene epochs. Data on two polymetallic districts are presented. The economically important Milpo-Atacocha district, located a few kilometers northeast of Cerro de Pasco near to the eastern edge of the polymetallic belt, is shown to be of middle Oligocene age and the now economically marginal Chungara district, located in the middle part of the belt southwest of Cerro de Pasco near the top of the western cordillera, appears to be of normal middle Miocene age. 30 Refs.

## Quebec

**074491 SYSTEMATICS OF CHLORITE ALTERATION AT THE PHELPS DODGE MASSIVE SULFIDE DEPOSIT, MATA GAMI, QUEBEC.** Hydrother-

mal alteration at the Phelps Dodge Archean volcanogenic massive sulfide deposit has converted rhyodacite and rhyolite footwall rocks into the following mineral assemblages: quartz-chlorite-albite-epidote±sericite, quartz-chlorite±sericite, chlorite±sericite, and chlorite-talc±stilpnomelane. Chlorites in the Si-Al-Mg-Fe system form a rectangular solid solution plane with limited substitution of Al for Si and extensive substitution of Fe for Mg. In Si-Al space the solid solution plane is outlined by Al saturation (presence of other Al-rich mineral) and Al undersaturation (presence of Al-poor or Al-free mineral) boundaries. Chlorites on the Al-saturated boundary of the solid solution field form a potentially useful geothermometer. The Fe/Fe+Mg ratios of bulk rock and contained chlorite correlate well. Birefringence colors of the chlorite change from green to brown, violet, and Berlin Blue as Fe/Fe+Mg changes from 0.18 to 0.64. The Fe/Fe+Mg variation apparently depends largely on the proportions of Mg-rich seawater and Fe-rich hydrothermal fluid in the altering brine. (Edited author abstract) 28 refs.

**074492 SPECTRAL LUMINESCENCE PROPERTIES OF NATURAL SPECIMENS IN THE SCHEELITE-POWELLITE SERIES, AND AN ASSESSMENT OF THEIR DETECTIVITY WITH AN AIRBORNE FRAUNHOFER LINE DISCRIMINATOR.** Spectral luminescence analysis, using a laboratory fluorescence spectrometer, of 85 scheelite-powellite specimens from 50 localities in the western United States shows that 46 specimens are within the sensitivity limits of a Fraunhofer line discriminator, an airborne electro-optical device for the detection of materials stimulated to luminescence by the sun. Three-dimensional perspective plots of excitation and emission spectra of the natural specimens are markedly similar in shape to perspective plots of 21 artificial scheelite-powellite specimens. Natural specimens show wider range in luminescence intensity than the synthetics. Luminescence intensity has been shown by other workers in the fabrication of artificial tungstate phosphors to be controlled by varying the amount of calcium, tungsten, rare earth element and trace element impurities, and temperature. (Edited author abstract). 28 Refs.

## Saudi Arabia

**074493 METALLIFEROUS SUB-MARINE SEDIMENTS OF THE ATLANTIS-II-DEEP, RED SEA.** The Atlantis II Deep is a stratified metalliferous deposit located along the medium valley of the Red Sea at a water depth of about 2200 m. The metal-bearing mud contains sulfides of zinc, copper and iron with significant amounts of silver, gold and cobalt. Mining geostatistics was applied to estimate the Red Sea offshore mineral resources. Kirging estimates indicated that 696.330 million t of bulk sediments contain 1.891 million t of zinc, 0.425 million t of copper and 3.75 thousand t of silver. Gold and cobalt contents were calculated from the analysis of solids in flotation concentrates as 47 t and 5368 t respectively. 10 refs.

## South Australia, Australia

**074494 ZIRCON U-PB DATING IN THE VICINITY OF THE OLYMPIC DAM CU-U-AU DEPOSIT, ROXBY DOWNS, SOUTH AUSTRALIA.** Isotopic data are presented for granitoids and felsic volcanics from the Stuart shelf of South Australia, some of which are spatially associated with the Olympic Dam Cu-U-Au deposit.

Close to the Olympic Dam deposit, the zircon U-Pb system of Olympic Dam suite quartz syenite was contaminated by barite precipitated from hydrothermal fluids associated with the mineralization. The abraded zircons have U-Pb ages similar to uncontaminated Olympic Dam suite zircons. Deformed and altered basement granitoids on the Stuart shelf have complex zircons with discrete cores and overgrowths which yield complicated U-Pb isotope systematics. Comparable apatite U-Pb and biotite Rb-Sr isotope dates from all the granitoids and from thin veins in the Acropolis prospect suggest regional cooling through the respective blocking temperatures. The Acropolis apatite date suggests at least some Stuart shelf mineralization was emplaced at, or before, about 1602 m.y. (Edited author abstract). 36 Refs.

## Spain

**074495 HYDROTHERMAL FLUID EVOLUTION OF THE SN-W MINERALIZATION IN THE PARRILLA ORE DEPOSIT (CACERES, SPAIN).** The Parrilla orebody, located on the southern border of the Caceres province, is a stockwork of quartz veins with scheelite and cassiterite. The Sn-W ore fills fractures in the Greylake Schist Complex, intruded in this area by Hercynian granites. Most of the veins strike N30°E and dip 45°SE. The mineral association includes scheelite and cassiterite, which are the most important economic minerals, and arsenopyrite, wolframite, sphalerite, chalcopyrite, pyrite, bismuth sulphosalts, pyrrhotite, quartz, muscovite and tourmaline. (Edited author abstract) 23 refs.

**074496 SILVER AND LEAD MINERALOGY IN GOSSAN-TYPE DEPOSITS OF SIERRA DE CARTAGENA, SOUTHEAST SPAIN.** Two strata-bound Pb-Zn-Ag orebodies (mantos) are currently being worked by the Sociedad Minera y Metalurgia Penarroya-Espana in the Sierra de Cartagena, southeast Spain. Associated with the primary ores are gossan-type oxidation zones; these supergene ores, which comprise two distinct mineral associations that were formed from the two primary manto assemblages under different pH conditions, are locally enriched in lead and/or silver. A preliminary evaluation of the gossan ores at two of the open-pit mines was undertaken to investigate the distribution of Pb and Ag in the different magnetic fractions of the ore. The results indicate that magnetic separation as a first-stage preconcentration method after crushing could be used successfully prior to beneficiation of silver by heap leaching. 19 Refs.

## Structural Analysis

**074497 SIZE DETERMINATION OF SLAB-LIKE ORE BODIES - AN INTERPRETATION SCHEME FOR SINGLE-HOLE MISE-A-LA-MASSÉ ANOMALIES.** Theoretical borehole mise-a-la-masse profiles are generated using the integral equation method for the case of a thin slab-like conductor and an analytical method for a thin disk-like conductor. It is shown that the potential gradient on intersection of the conducting body is related to the lateral extent of the body. A characteristic curve is presented showing the potential gradient on intersection as a function of the surface area of the body. A correction may be made if the borehole is not perpendicular to the conductor. The use of the scheme is illustrated with a field case. (Edited author abstract) 7 refs.

# Tasmania, Australia

**074499 TIGHTLY FOLDED, GOLD-RICH, MASSIVE SULFIDE DEPOSIT: QUE RIVER MINE, TASMANIA.** The Que River deposit in western Tasmania is a high-grade, gold-rich, Cambrian volcanogenic sulfide deposit, comprising two major subvertical ore lenses hosted by andesitic lavas and volcanoclastics of the Mount Read Volcanics. The major orebodies are considered to lie at the same stratigraphic level and be folded into a tight asymmetric syncline which has been sheared along its western limb. Copper, lead, and zinc distribution within the lenses provides evidence of a stratigraphic younging direction around the fold structure. Gold grades of 5 to 30 ppm are concentrated toward the interpreted stratigraphic top of the folded lens. A conspicuous fuchsite-bearing horizon of altered coarse-grained polymict volcanoclastic immediately overlies the major ore lenses, and it is in turn overlain by flow-banded dacite lavas and lava breccias which lack significant hydrothermal alteration. (Edited author abstract). 31 Refs.

# Tennessee

**074500 STRONTIUM ISOTOPIC GEOCHEMISTRY OF MISSISSIPPI VALLEY-TYPE DEPOSITS, EAST TENNESSEE: IMPLICATIONS FOR AGE AND SOURCE OF MINERALIZING BRINES.** Strontium isotopic ratios of wall-rock, ore, and gangue minerals from the Mascot-Jefferson City, Copper Ridge, and Sweetwater Mississippi Valley-type (MVT) districts and from the Lost Creek barite deposit in East Tennessee were measured in an effort to determine the age of this mineralization and its relation to the tectonic evolution of the Appalachian orogen. Of the three possible source basins for the MVT brines, the Late Proterozoic Ocoee, Cambrian Luttrell, and Ordovician Sevier basins, the Sevier basin appears to be the only one that could have supplied brines of the appropriate composition at geologically reasonable times. The maximum ages of the Lost Creek, Sweetwater, Copper Ridge, and Mascot-Jefferson City mineralization are 520, 460, 405, and 395 m.y., respectively. The Lost Creek barite mineralization formed as an exhalative deposit in the Sevier basin and that the Sweetwater fluorite-barite mineralization formed during the later part of the Taconic orogeny. The Copper Ridge and Mascot-Jefferson City mineralization could have formed either prior to or during the Alleghanian orogeny. (Edited author abstract). 65 Refs.

**074501 ACTIVE ORE FORMATION AT A BRINE INTERFACE IN METAMORPHOSSED DELTAIC LACUSTRINE SEDIMENTS: THE SALTON SEA GEOTHERMAL SYSTEM, CALIFORNIA.** The Salton Sea geothermal system is an area of active hydrothermal metamorphism of Pliocene to Pleistocene deltaic, lacustrine, and evaporitic sediments deposited in a modern continental rift zone. Base metal ore mineralization occurs in vertical fractures that comprise the major form of fluid permeability at 1 to 3 km in the modern geothermal system. Fluid inclusions record an apparent steep, progressive salinity increase in the vein systems in the upper 2 km of the system. However, fluid production data from Salton Sea geothermal wells indicate that reduced, metaliferous hypersaline brine averaging 23 wt percent total dissolved solids is overlain by more oxidized, metal-poor fluid averaging 5 wt percent total dissolved solids. A model is developed for type 2 vein ore formation involving mixing at the interface between the two fluids. Ore formation in the system is caused by the coincidence of transaxial entry of a major river into an active rift zone, deposition of metal-bearing deltaic sediments to form a closed-basin sedimentary environment, episodic lacustrine evaporite formation, and injection of heat and elements by rift-related magmatic intrusions at depth. (Edited author abstract). 47 Refs.

**074502 QUIRUVILCA, PERU: MINERAL ZONING AND TIMING OF WALL-ROCK ALTERATION RELATIVE TO Cu-Pb-Zn-Ag VEIN-FILL DEPOSITION.** Wall-rock alteration types from the vein margin outward and from most intense to least intense are intense sericitic, strong sericitic, moderate sericitic, strong argillic, weak argillic, and propylitic. Petrographic observations indicate that at any given location, propylitic alteration is oldest, followed by argillic, and then sericitic alteration. The zoned alteration halos formed as each inner assemblage advanced, overprinted, and replaced its adjacent outer precedent. Correlation between paragenetic stages of vein fill and wall-rock alteration is based upon the mineralogy and wall-rock alteration of single-stage veinlets that are zoned about major veins. Temperatures of ore deposition, deduced from the stability of various mineral assemblages, decreased through time from >320° to <230°C. Additional study results are discussed. (Edited author abstract) 52 refs.

**074503 ROCK ALTERATION, MERCURY TRANSPORT, AND METAL DEPOSITION AT SULPHUR BANK, CALIFORNIA.** The hydrothermal alteration at Sulphur Bank, Lake County, California, is characterized by the phases alunite, kaolinite, and amorphous silica. Comparison between the observed mineralogical zonation and theoretical simulation of the water-rock interaction reveals that the alteration process at Sulphur Bank may be described on a broad scale in terms of an irreversible thermodynamic model based on the assumption of local equilibrium. However, this theoretical model alone fails to explain the details of the mineralogical zonation of the veins and alteration halos at Sulphur Bank. The zonation may be the result of a coupled reaction-fluid transport system in which two solute transport mechanisms - advective flow through open veins and diffusion - build superimposed alteration sequences. As a result of aqueous mercury-complex stability studies, it is inferred that mercury is transported as sulfide complexes at Sulphur Bank. Both boiling and oxidation are effective depositional processes for cinnabar according to theoretical calculations presented. (Edited author abstract). 46 Refs.

# Yukon

**074505 GOLD-COPPER-BISMUTH MINERALIZATION IN HEDENBERGITE SKARN, TOMBSTONE MOUNTAINS, YUKON.** Gold mineralization on the Marn property, Yukon, occurs in two pyroxene skarn bodies, which are adjacent to the Mount Brenner Stock in the Ogilvie Mountains. The skarns are separated by a 600 m wide monzonite intrusion and show contrasting mineralogical and geochemical characteristics in addition to quite different metal values. Significant but uneconomic Au, Ag, W, and Cu mineralization is found in skarn on the north side of the intrusion, while very low Au grades (0.052 g/t) occur at the southern contact. The mineral assemblages of both skarns are dominated by iron-rich pyroxenes. The iron content of the pyroxenes varies between Hd<sub>40</sub> and Hd<sub>80</sub> in the northern location and Hd<sub>60</sub> and Hd<sub>100</sub> in the southern skarn. A well-developed sequence of retrograde alteration affected only the northern skarn. The relationship of this type of skarn to the hedenbergite skarn is ambiguous, since there is no large-scale mineralogical zoning. (Edited author abstract) 27 refs.

# Mechanization

**074507 MECHANIZATION OF LABOR-INTENSIVE WORK AT THE WEST SIBERIAN METALLURGICAL COMBINE.** Ore is broken up by grates when it is unloaded from railcars at the car dumper. A number of workers are needed to clean grates. To eliminate this deficiency, spring-opposed vibrating grates was installed in the hoppers of the car dumper. A layer of grease is left on the walls and bottom of the container after unloading. To mechanize this unproductive operation, save grease, and improve safety and working conditions, the authors developed a manipulator with a vibrating table.

**ORE SAMPLING** See Also COAL—Quality Control; GOLD MINES AND MINING—France; TIN ORE TREATMENT—Flotation.

**074508 RELATIONSHIP BETWEEN OBSERVED MINERAL LIBERATIONS IN SCREENED FRACTIONS AND IN COMPOSITE SAMPLES.** An investigation was conducted to determine the minimum number of samples that must be studied by image analysis of polished sections to characterize a mill product and determine the apparent mineral liberation. It was found that a representative polished section cannot be prepared from an unscreened sample that has a wide size range of particles. Similarly, individual screened fractions are not representative of the sample because minerals are partitioned during screening and the quantities of soft brittle minerals are increased in fine grained fractions, whereas the quantities of hard minerals are increased in coarse grained fractions. Results obtained by combining data for a series of narrow size range screened fractions (one Tyler size range) are representative of the sample, and relatively accurate data can be obtained by analyzing each fraction and combining the data. (Edited author abstract) 4 refs.

**074512 ESTIMATION OF MODEL PARAMETERS FOR LIBERATION AND SIZE REDUCTION.** In previous work at Virginia Tech, a population balance

model describing the simultaneous processes of size reduction and mineral liberation has been developed. Experimental verification of this model, however, has been limited to a binary mineral system containing only one composite particle class. When considering multiple classes of composite particles, estimation of model parameters becomes more difficult. In the present work, a procedure for estimating model parameters for a multiple composite class model has been developed. Emphasis is placed on direct experimental determination of these parameters. The physical significance of the breakage rate function and the liberation function in characterizing the liberation process is also discussed. (Author abstract) 17 refs.

**074513 ACTIVITIES OF WATER AND HCl IN AQUEOUS SOLUTION SYSTEMS OF HCl-MCL<sub>n</sub> INCLUDING CuCl<sub>2</sub>, NiCl<sub>2</sub> AND FeCl<sub>3</sub>.** Activities of HCl in the HCl-CuCl<sub>2</sub>, HCl-NiCl<sub>2</sub> and HCl-FeCl<sub>3</sub> aqueous solution systems which cannot be determined by the emf method were calculated at 298 K by applying the McKay-Perring method based on the measured water activities. The water activities of these solutions and those of HCl-NaCl solutions were determined by a transpiration method and the b values involved in the corrected Zdanovskii equation were evaluated as a function of water activity. The calculated values of a(HCl) of the aqueous solution system of HCl-NaCl agreed well with those determined by the emf method at both dilute and concentrated HCl levels. The change in a(HCl) with an increase in chloride concentration is attributable to the change in ionic strength of the solution, and thus the concentration of the chemical species present in the solution. (Edited author abstract) 35 refs.

Awakura, Yasuhiro (Kyoto Univ, Kyoto, Jpn); Kawasaki, Yukio; Uno, Akito; Sato, Koji; Majima, Hiroshi. *Hydrometallurgy* v 19 n 2 Dec 1987 p 137-157.

**074514 ISOIONIC POINT AND MINIMUM SOLUBILITY OF CARBONATE MINERALS.** The isoionic point is defined as the pH of an aqueous solution in equilibrium with a solid and the atmosphere. Mineral-/aqueous solution equilibria on magnesite suspensions open to the atmosphere show that the pH of minimum solubility of carbonate minerals is not equivalent to the isoionic point of the mineral suspension. For magnesite suspensions, the isoionic point occurs at pH 8.4, whereas the minimum solubility of the mineral occurs at pH values higher than 10.4. (Edited author abstract) 11 refs.

Lopez-Valdivieso, A. (Univ of California, Berkeley, CA, USA). *Min Eng* v 1 n 1 1988 p 85-87.

**074515 RECENT MINERAL PROCESSING DEVELOPMENT AT BOLIDEN.** The Swedish Boliden group, the largest Scandinavian industrial group in the fields of sulphide ore mining, non-ferrous metal smelting and the production of inorganic chemicals is faced with the same difficulties as in other industrial countries - dwindling deposits of high-grade ore, growing requirements of environmental protection, rising energy costs and a high cost situation. The pressure of having to continuously adapt processing technique to the poorer and more strongly growing deposits determines the current activities in the area of preparation technique. The programs of development have recently been focused on the particularly pressing problem areas of autogenous grinding, recovery of precious metals, dewatering and process control. The work carried out to this time is reported on and an outlook is given on future developments. (Author abstract)

Hultqvist, J. *Aufbereit Tech* v 29 n 4 Apr 1988 p 179-185.

**074516 REACTION BETWEEN SPODUMENE AND TACHYHYDRITE.** The reaction between spodumene Li<sub>2</sub>O·Al<sub>2</sub>O<sub>3</sub>·4SiO<sub>2</sub> and tachyhydrite (CaCl<sub>2</sub>·2MgCl<sub>2</sub>·12H<sub>2</sub>O) at temperatures above 1270 K, when the spodumene has transformed from the unreactive

γ-form to the β-form, was studied by varying the reaction temperature and the relative proportions of the two minerals in the reaction mixtures. Mass balances as well as X-ray diffraction to identify the reaction products indicate that the reactions that occur are: decomposition of the tachyhydrite, losing at first some of its water of crystallization, followed by MgCl<sub>2</sub> hydrolyzing to MgO; transformation of the γ-spodumene into β-spodumene; a reaction between the β-spodumene, MgO produced from tachyhydrite, and CaCl<sub>2</sub> of the tachyhydrite according to the equation Li<sub>2</sub>O·Al<sub>2</sub>O<sub>3</sub>·4SiO<sub>2</sub> + CaCl<sub>2</sub> + 8MgO = 2LiCl + CaO·MgO·SiO<sub>2</sub> + 3SiO<sub>2</sub>·2MgO + Al<sub>2</sub>O<sub>3</sub>·MgO. X-ray diffraction confirmed the presence of all the phases in the products except the phase containing alumina. Considerations of the quaternary phase diagram Al<sub>2</sub>O<sub>3</sub>-SiO<sub>2</sub>-MgO-CaO show that the phases indicated as reaction products are the ones expected under equilibrium conditions at the reaction temperature. Calculated standard free energy change of the suggested reaction is -211926 Joules at 1423 K, indicating that under standard conditions the reaction is possible. (Author abstract). 11 Refs.

## Agglomeration

**074521 CONSIDERATIONS ON AGGLOMERATE GROWTH PROCESSES: STUDIES ON AGGLOMERATION IN WATER (2ND REPORT).** Agglomeration experiments were carried out using BaSO<sub>4</sub> as model particles, sodium oleate (NaOl) as the surface active reagent and kerosene as the bridging liquid agglomerate growth processes are classified into three patterns. The pattern 1) agglomerates were formed immediately after the experiment started and they gradually grew to certain sizes after which agglomerate growth slowed down. In pattern 2) micro-agglomerates were formed and after a certain aging time they grew to large agglomerates with intermediate size agglomerates also present. In pattern 3) micro-agglomerates were formed and after a certain aging time they grew to large agglomerates with almost no intermediate size agglomerates. Simulations of these patterns were conducted using population balance equations. (Edited author abstract) In Japanese. 10 refs.

**074522 ULTRAFINE PARTICLE PROCESSING: A METHOD FOR ALUNITE BENEFICIATION.** Alunite has been used as raw material for producing alumina and potassium sulfate fertilizer in Russia for many years. In the United States, this mineral has not been commercially processed though reserves of 5 to 10 billion tons of alunite ore have been estimated. A new method for the beneficiation of alunite ore utilizes a small amount of fine magnetite upon which the liberated quartz is selectively flocculated. The co-flocculated magnetite and quartz are then separated from the alunite in a high gradient magnetic separator. An alunite concentrate of 90% grade with 80% recovery has been obtained from Utah ore. (Edited author abstract) 22 refs.

**074523 VORSCHLAG FUER EIN AUFBEREITUNGSTECHNISCHES CODE-SYSTEM.** [Proposal for a Beneficiation Code System]. A code system of abbreviations to identify material flows, mineral dressing apparatus and transport lines is described. It is based on groups of two letter codes each. The codes derive from English identification of material flow and apparatus. The advantages of applying the code system are described. (Edited author abstract) In German.

Papacek, Herbert G. (Exploration und Bergbau GmbH, Duesseldorf, West Ger); Flegel, Erich. *Erzmetall* v 40 n 9 Sep 1987 p 462-465.

**074524 CONTRIBUTION TO THE BENEFICIATION OF A TANTALUM/NIOBIUM ORE FROM CHINA.** The Federal Institute of Geosciences and Natu-

ral Resources (of the Federal Republic of Germany) has been exploring for niobium and tantalum in weakly greisenized and albitized pegmatites in the Guangdong province of southern China. In so doing, it has discovered mineralization there of approximately 230 ppm Ta and 80 ppm Nb. By means of a test program incorporating several stages and involving both small specimens and also a large sample, investigations were carried out concerning the possibility of concentrating these ores. It was demonstrated that <0.2 mm and 50% <0.07 mm could be concentrated with a good Nb/Ta recovery level by adopting a process of grinding/high-intensity magnetic separation/table grading and flotation of middlings. This produces a columbite concentrate with approximately 30% Ta and a valuable metal recovery of 70-75%. (Edited author abstract) In German and English. 3 refs.

**074525 BENEFICIATION OF CELESTITE: ORE STRIPA APPLICATION IN TURKEY.** The paper describes some laboratory concentration studies made on rejects from hand picked celestite ore by attrition tumbling and wet screening. The -25mm + 1mm fraction is taken as coarse concentrate or alternatively a concentrate can be obtained by jigging of this fraction. The -1mm fraction is further treated on shaking tables to produce a concentrate. A celestite beneficiation plant is described which includes a jaw crusher, attrition tumbler and a Stripa unit to upgrade the -25mm fraction. The Stripa product is treated on jigs and shaking tables to obtain a concentrate. Finally, examples are given of the Stripa used as pre-concentration step with respect to iron ore, chromite, and barytes. 3 refs.

**074526 AUTOMATIC IMAGE ANALYSIS FOR MINERAL BENEFICIATION.** Mineral recoveries from a concentrator can often be improved by determining mineralogical characteristics that affect mineral behavior during beneficiation. Classic mineralogical studies provide qualitative information but do not define mineral behavior when quantitative data are needed. In contrast, image analysis provides quantitative mineralogical data. One image analysis system, MP-SEM-IPS, developed in the CANMET laboratories of the Department of Energy, Mines and Resources at Ottawa, Canada, consists of an electron microprobe to produce an image, an energy dispersive x-ray analyzer (EDXA) to identify the minerals, and a Kontron SEM-IPS image analyzer to determine mineral characteristics. The article describes the technique and gives several examples of applications. 4 refs.

**074527 TENDINTE MODERNE IN VALORIFICAREA SUPERIOARA A MINERURILOR, CONCENTRATORUL SI SUBPRODUSELOR DIN METALURGIE.** [Modern Trends in Upgrading Ores, Concentrates and By-Products in Metallurgy]. Under current conditions, the technologies of upgrading ores, concentrates and byproducts in metallurgy have experienced radical transformations. These include process combination (preconcentration, selective concentration, treatment in the presence of chemical reagents, pyrometallurgical treatment), operation improvements (crushing, grinding, classifying, calcining, dissolution, extraction and changes in the process flows. These transformations have led to the creation of several specific versions for each raw material category. (Edited author abstract). 6 Refs. In Romanian.

## Chelation

**074528 APPLICATIONS OF CHELATING AGENTS IN MINERAL PROCESSING.** Because of their metal specificity chelating agents can function as effective mineral processing reagents. A brief review of work carried out in this area is presented. Some of the features of mineral flotation and flocculation with chelating-type reagents such as bulk vs. surface chelation, the role of pH, mineral solubility, solution chemistry of reagents, and temperature are illustrated with examples. The problems associated with the commercialization of chelating reagents for ore beneficiation and the research efforts required in this area are also discussed. (Edited author abstract) 120 refs.

## Chlorination

**074529 TRAPPING AND TREATMENT OF GOLD-RICH CHLORIDE SUBLIMATES.** A basic scheme for trapping and treating chloride sublimate of resistant gold-containing ash is proposed. The scheme includes wet trapping of chlorides in a recirculating-solution system, filtration of the trapped sludge, smelting of the filter cake into a gold-silver alloy, and additional extraction of silver from the trapping solutions by cementation. The scheme provides for extraction of noble metals into the end product - the gold-silver alloy. The expected extraction by this scheme is 96.8-97.5% for gold and 88.3-90.0% for silver. 4 refs. In Russian.

Classifiers See Also COPPER ORE TREATMENT—Classifiers.

**074530 SAND PROCESSING, PRODUCT OPTIMIZATION AND WASTE TREATMENT. PART 2 - CLASSIFICATION.** In considering classification and classifiers, it is useful to understand the terms 'overflow' and 'underflow' which can be applied to all processes and types of equipment. The overflow contains the finest of the product/waste fractions. The coarser underflow may be in one or several fractions and often exists in a partially dewatered state. All these factors can be engineered into a sand classification system. The article discusses the physical processes involved and the equipment designed around these processes. 2 refs.

**074532 USEFUL GENERAL TWO-MILL CIRCUIT MODEL.** A circuit is proposed which consists of two mills, four classifiers and three stream splitters. It is shown that this circuit reduces to a number of simpler circuits of industrial interest. A program was written to compute the steady state performance of this general circuit assuming first order mill and classifier models. The overfilling correction was appropriately incorporated. This program enables the effect of different ways of connecting two mills

to be investigated as a function of make-up feed size distribution and desired product specifications. (Edited author abstract) 8 refs.

**074533 EFFECT OF TEMPERATURE ON HYDROCYCLONE EFFICIENCY.** Plant investigations and laboratory experiments have been conducted in order to study the effects of temperature on the classification efficiency of a cyclone. It is demonstrated that under otherwise constant operating conditions, alterations in temperature produced a nearly linear change in  $d_{50(c)}$  size. However, the sharpness of the separation, as defined by the reduced efficiency curve, shows no dependence on temperature. The mineral used for the experiments was pure silica. The investigations were carried out in an iron ore processing plant located in the northern U.S. which experiences substantial seasonal temperature variations. (Edited author abstract). 10 refs.

**074534 PHENOMENOLOGICAL MODEL OF THE HYDROCYCLONE: MODEL DEVELOPMENT AND VERIFICATION FOR SINGLE-PHASE FLOW.** Hydrocyclone models hitherto reported in the literature are empirical expressions that relate device dimensions and inlet flow conditions with separation parameters. Therefore, the applicability of such models is limited. Phenomenological models can cover a broader range and incorporate the geometry of the device in the model expressions. The first step in this effort is to solve the fluid-dynamic equations for single-phase flow before solving the actual two-phase flow problem. Experimental measurements of velocity profiles made in a 75-mm hydrocyclone and their prediction by solving the Navier-Stokes equation are shown. (Author abstract) 24 refs.

## Computer Applications

**074535 BUMP AND GRIND. HOW A COMPUTER CAN REDUCE MILL COSTS.** The system can manipulate all of the variables which affect the outcome quickly enough to eliminate the impact of large differences in the feed. Process control consists of continuous monitoring of the streams, comparison with selected setpoints or ratios, control of the flow or reagent addition rates, logging data, and the compiling of data into reports. Computers were introduced to the system in the early 1960s and have speeded up all of the functions. The system can manipulate all of the variables which affect the outcome quickly enough to eliminate the impact of large differences in the feed. The article gives nine examples of computer applications in Canadian ore treatment mills.

Werniuk, Jane. *Can Min J* v 109 n 8 Aug 1988 p 27-30.

## Computer Simulation

**074536 TREATMENT OF POLISHED SECTION DATA FOR DETAILED LIBERATION ANALYSIS.** A transformation equation can be used to describe the relationship between the one, two and three dimensional information regarding the composition of mineral particles of specified size. Linear or areal grade distribution ( $f_g$ ) can be transformed to an estimate of the volumetric grade distribution  $p(g)$  via a transformation function  $H(g, |g, N_n, \dots)$ , a conditional probability function. The effects of the external particle structure (shape) and internal grain characteristics (grade, dispersion density, and grain size distribution) on the transformation matrix have been evaluated by computer simulation of randomly oriented, irregularly shaped multiphase particles. Volumetric grade and dispersion density (number of grains per particle) are

the most important variables which influence the transformation matrix. Least square minimization of fitted functions and the Phillips-Twomey inversion technique have been used to solve the transformation equation. Three examples, a computer simulated volumetric grade distribution and two experimental depth profiles of different monosize particle samples (iron ore and copper ore), provide evidence that such an approach can be useful for liberation analysis. (Author abstract) 12 refs.

**Concentration** See Also GOLD ORE TREATMENT—Leaching.

**074537 PUTTING LA CARIDAD RIGHT.** These are just some of the problems faced at La Caridad and some of the solutions. Some of the solutions, the reclining cyclones and the reversible lifter bars in the mills, are particularly notable and may find useful application in other concentrators. The La Caridad flotation plant has been essentially rebuilt, and the crushing and screening plants have been substantially modified. The remaining materials handling problems relate to the intermediate and fine ore storage, but satisfactory solutions will require money not currently available. The pressure will now be on the mine to produce the 90,000 mt/d of ore required to feed the plant to capacity.

**074538 STUDY OF THE MOVEMENT OF PARTICLES ON THE TABLE WITH NON-HARMONIC MOTION.** According to the principles of incompressible viscous fluid flow, the velocity equation of particles on a table with non-harmonic motion is obtained through strict mathematical derivation. The velocity equation shows that, in addition to the non-harmonic motion, the particle possesses a uniform motion term and the velocity of the particle increases with the amplitude and the frequency of the non-harmonic motion. This equation is applicable in film-type gravity concentrators. (Edited author abstract). 11 refs. In Chinese.

## Control

**074539 FUZZY LOGIC: A POTENTIAL CONTROL TECHNIQUE FOR MINERAL PROCESSING.** Recent advances in the theory of fuzzy sets have led to application of this science to process control. Fuzzy logic can be used to develop heuristic or rule-of-thumb controllers with the strategy based on the actual operating practice of experienced plant operators. A heuristic controller has been designed and tested with a computer simulation model of a secondary crushing plant. The results are discussed and future applications of this control technique to other mineral processes are suggested. (Edited author abstract) 8 refs.

## Costs

**074540 BUREAU OF MINES COST ESTIMATING SYSTEM HANDBOOK (IN TWO PARTS): 2. MINERAL PROCESSING.** This Bureau of Mines report and its companion report (Information Circular 9142) have been prepared to assist in the preparation of prefeasibility type estimates for capital and operating costs of beneficiation of various types of mineral occurrences using current technology. The handbook provides a convenient costing procedure based on the summation of the costs for the unit processes required in any particular mining or mineral processing operation. The unit process sections may be used to generate, in January 1984 dollars, costs through

the use of either costing curves or formulae representing the prevailing technology. The mineral processing handbook includes individual cost estimation sections for unit operations associated with comminution, beneficiation, solid-liquid separation, hydrometallurgy, and special applications as well as infrastructure and plant general and administrative costs.

Anon (US Bur of Mines, USA). *Inf Circ US Bur Mines* 9143 1987 577p.

**074541 IMPACT OF CHANGING ENERGY ECONOMICS ON MINERAL PROCESSING.** The cost per energy unit has shown the single greatest cost increase in the mineral industries. Thus, the potential for savings in operating costs are significant. Comminution is the major consumer of energy in mineral processing plants. As shown, there are at least six areas in comminution where significant energy reductions should be possible. Flotation energy reduction is already possible by using larger cells. New liquid-solids separation methods are available that offer potential energy savings as well as other cost reductions. 12 refs.

**074542 CLOSED GRINDING CIRCUIT RESIDENCE TIME DISTRIBUTION ANALYSIS.** Knowledge of the amount of time material spends in a continuous mill in a closed grinding circuit is essential for circuit performance analysis and scale-up design. A convenient method for acquiring this information involves the use of pulse tracers in residence time distribution (RTD) experiments. In typical grinding circuit experiments, RTD measurements are done by injecting a pulse tracer into the mill inlet and detecting it in the circuit exit. In this article, an easy mathematical method for calculating mean residence time and the degree of mixing of material in a closed grinding circuit is developed. The analysis of impulse response data obtained from several commercial grinding circuits using this method is presented. (Edited author abstract) 13 refs.

Rogovin, Z. (3M Co, St. Paul, MN, USA); Lo, Y.C.; Herbst, J.A.; Rajamani, K. *Miner Metall Process* v 4 n 4 Nov 1987 p 207-214.

**074543 ENERGY SAVING IN VERTICAL SHAFT IMPACTORS.** Although considered to be a newcomer, the principle of the VSI crusher has been in existence for many years. This article discusses the use of Vertical Shaft Impact Crushers in the field of tertiary and quaternary crushing, and more recently in the coarser fractions of the milling operation. A description of the machine is given.

Hill, H.E. *Mine Quarry* v 16 n 12 Dec 1987 p 27-31.

**074544 MODELING OF COMMINUTION IN HAMMER MILLS - PART 1.** This paper is a continuation of the efforts to install a mathematical model for the comminution in hammer mills. Here, in opposition to known models the solid mass flow rates inside the grinding chamber are taken into account. The model describes the comminution in a sieve hammer mill as a general case of comminution split into two steps. The first comminution step is the one time stress by the first impact at the hammers. The second comminution step realizes the continuous comminution of particles which move in a platen-roller formed between hammer tops and sieve cylinder. The particles fly off the roller and are stressed by the hammers. The equations presented describe the development of mass flows of single fractions inside the platen roller in dependency on the position at the sieve circumference at steady state. The possibility of an experimental determination of the necessary classifier and

selection coefficients is determined by experiments at a sieve hammer mill of small industrial scale, as described in part 2 of this work. (Edited author abstract) In German and English. 9 refs.

**074545 DETERMINATION OF OPTIMUM IMPACT-BREAKAGE ROUTES FOR AN ORE.** Single ore particles of various sizes were broken in an impact breakage device at varying levels of impact energy. It is shown that an optimum impact energy can be determined for the breakage of an ore particle of a given size to a specified product size and that the optimum usage of impact energy is often obtained by the use of a number of breakage steps for the size reduction of a particle. The optimum level of the impact energy is dependent on the size of the particle to be broken and is influenced by the size of the final product required and the efficiency of secondary breakage. The significance of these results in relation to the optimization of breakage events in grinding mills is discussed. (Edited author abstract) 10 refs.

Pauw, O.G. (Council for Mineral Technology, Randburg, S Afr); Mare, M.S. *Powder Technol* v 54 n 1 Jan 1988 p 3-13.

**074546 ANALYSIS OF DYNAMIC RESPONSES IN AN INDUSTRIAL GRINDING CIRCUIT.** The dynamic behavior of grinding circuits is an important consideration in the development of process automation. The influences of the feed rate, sump water addition and circulating load on some important process variables, such as product particle size, pulp flow rate and density, have been investigated with the aid of a large amount of dynamic data from an industrial closed grinding circuit collected by a microcomputer sampling system. The results showed that the fresh feed rate was the main manipulating variable governing the dynamic behavior. The control of circulating load is one of the feasible approaches in process optimization of closed grinding circuits. (Edited author abstract) 6 refs.

**074547 EFFECTS OF MILL SPEED AND FILLING ON THE BEHAVIOUR OF THE LOAD IN A ROTARY GRINDING MILL.** The dynamics of the ball load within a wet-grinding mill are examined. Both variables tested - mill filling and rotational speed - influence the position of the load, and hence the torque. An increase in mill speed and filling causes the torque to increase to a maximum value, after which further increases in speed or filling cause the torque to decrease. The position of the load toe is influenced only by the filling up to speeds of approximately 80 per cent of critical, whereas the speed and filling both cause the load shoulder to rise as their magnitudes are increased. The power drawn by the mill is predicted by the use of equations and these values are compared with the measured power draw. (Edited author abstract) 12 refs.

**074548 SIZE REDUCTION OF MAGNETITE SAND TO NANOMETRE POWDER IN A LABORATORY VIBRATION MILL.** A size reduction of a magnetite sand (300 - 425µm) to the extreme ultra-fine sizes ( $D_{50}$  = 10.7 nm), designated as a nanometre (sub-domain) powder, was accomplished in a vibration mill. On the basis of average particle size and grinding time, five stages of size reduction can be recognized, namely fine sand, micrometre (single domain) powder, and nanometre (subdomain) powder. The operating conditions and powder characteristics were determined for each stage. Micrographs of the products are presented. The mode of comminution for the different stages differ as a result of several predominant factors, namely micro-

structure of the test material, rheology of the pulp and magnetic agglomeration. (Edited author abstract) 37 refs.

**074550 WEAR AND CHIPPING OF COARSE PARTICLES IN AUTOGENOUS GRINDING: EXPERIMENTAL INVESTIGATION AND MODELLING.** The surface mechanisms of loss of mass for coarse particles in wet autogenous grinding was investigated in batch experiments using tumbling mills of 0.75 and 1.75 m diameter. Measurements of wear were carried out by following the mass of individual particles. The effect of percentage of fines present in the mill, load volume, particle roundness and mill diameter on breakage rate was established. A simple model based on a population balance analysis similar to the one used for the prediction of ball size distribution in ball mills was used to compare predicted and actual load size distribution in continuous autogenous and semi-autogenous pilot plant tests in the 1.75 m diameter mill. (Author abstract) 13 refs.

Goldman, M. (Univ Laval, Can); Barbery, G. *Min Eng* v 1 n 1 1988 p 67-76.

**074551 RAPID METHOD FOR MEASUREMENT OF FINENESS OF GRIND.** The method involves no drying of screened products and results can be obtained within a few minutes. Although the rapid method is less accurate than the conventional method of drying screened products, in certain cases this lack of accuracy may be of less importance than the increased speed of assessment. The accuracy of assessment can be reliably forecast from a simple expression provided measurement errors can be estimated. (Edited author abstract) 1 ref.

**074552 EFFICIENCY OF GRINDING HARD AND ABRASIVE INDUSTRIAL MINERALS IN A ROLLER-AND-PLATE MILL.** Data received from commissioning a Loesche roller-and-plate mill and operational data over a 6 months period show very satisfying results with regard to power consumption and production as compared to previous results obtained by operating an autogenous air-swept tumbling mill of large diameter. Operational data of a conventional ball mill, installed in a German commercial grinding plant utilizing an identical mineral, show interesting results regarding the energy efficiency of the roller-and-plate mill. The mill had been installed in Bikita, Zimbabwe, to grind primarily petalite, a lithium-aluminum silicate, as well as other minerals like spodumene and feldspar. (Author abstract)

Loesche, Th. *Aufbereit Tech* v 29 n 4 Apr 1988 p 203-207.

**074553 CLASSIFICATION EFFECTS IN WET BALL MILLING CIRCUITS.** The concept of classification in wet closed circuit ball milling is expanded beyond the performance of the classifying equipment to include all aspects of the fines removal system of the grinding circuit. The fines removal effectiveness of ball milling circuits is closely related to the residence time characteristics of the mill as well as the performance of the classification equipment. Material breakage characteristics and lengthy

retention time for at least some of the solids limit the extent to which the classification characteristic of the equipment influences the overall fines removal process and the grinding efficiency of the circuit. (Edited author abstract) 34 refs.

**074554 ANALYSIS OF JOINT DISTRIBUTION OF NUMBER OF CYCLES AND RESIDENCE TIME IN A SELECTIVE RECYCLE SYSTEM.** The first two equations of central moments of the residence time distribution (RTD) derived from the transfer function of a selective recycle system are given. Analysis of the joint distribution of number of cycles distribution (NCD) and RTD and total regional residence time distribution (TRRTD) in a selective recycle comminution system has been analyzed using gamma distribution. General mathematical models showing the relationship between the NCD, RDT, and TRRTD have been given in terms of the covariances and correlation coefficients of pairs of those variables. The example concerns a ball mill used to grind sulfide ore at Vammala mine in Finland. (Author abstract) 12 refs.

**074555 ENERGY SPLIT IN MULTICOMPONENT GRINDING.** An energy split factor is defined as the ratio of energies expended when unit-mass of a mineral is ground in a mixture environment and ground alone for the same time interval. Provided the grinding path of a mixture component remains invariant in the two grinding modes and the mill power-breakage rate function correlation holds, the energy split factor can be computed from breakage rate functions or initial rates of production of fines or from data for top-size feed particles remaining unbroken as a function of time. For illustration and verification, three sets of mixture grinding data have been employed, namely, calcite-quartz and hematite-quartz, both in 1:1 volume ratio, and dolomite-hematite in four different compositions. (Edited author abstract) 11 refs.

**074556 EFFECTS OF LIFTER BARS ON THE MOTION OF en-MASS GRINDING MEDIA IN MILLING.** Cinematographic films were analysed in the quantitative assessment of the effects of rectangular lifter bars on the motions of en-masse grinding elements in an experimental mill. It was found that, while lifter bars eliminate the slip of the grinding charge against an otherwise smooth liner, they increase the dynamic pressure and the intensity of abrasive interactions in the bulk of the en-masse grinding charge. They also increase the intensity of the impactive interactions in a mill as a result of their lifting action, which promotes cataracting of the grinding charge, and their keying-in action, which increases the kinetic energies and the rates of transport of grinding elements through the en-masse regime. (Author abstract) 15 refs.

**074557 CORRELATION BETWEEN PROBABILITY OF BREAKAGE AND FRAGMENT SIZE DISTRIBUTION OF MINERAL PARTICLES.** The energy consumption in industrial grinding depends considerably on the particle size. This phenomenon has been described by well known comminution laws. It is now explained quantitatively for spherical particles using Weibull statistics for the flaw size distribution, Hertz theory of the stresses, and fracture mechanics for the crack propaga-

tion. The resulting simple equations are applied for the description of several experiments with spherical and non-spherical particles. (Author abstract) 17 refs.

Weichert, Reiner (Univ of Karlsruhe, Karlsruhe, West Ger). *Int J Miner Process* v 22 n 1-4 Apr 1988, Recent Adv in Comminution, Conf Pap, Salt Lake City, UT, USA, 1987 p 1-8.

**074558 PREDICTION OF PARTICLE COMPOSITION DISTRIBUTION AFTER FRAGMENTATION OF HETEROGENEOUS MATERIALS.** A review of problems encountered in developing prediction models for composition distribution for particles obtained by the breakage of multiphase materials is presented. The need to characterize texture by image analysis, describe particle production by similar methods, relate particle production and texture, and use integral geometry methods and stochastic geometrical processes to solve the complex probability equations in three-dimensional space is stressed. A presentation is made of a model which incorporates the required elements. A special case of the model, combining a description of texture based on a Boolean model with primary Poisson polyhedra grains of particle production calibrated on screen fractions extracted from ground ores, is presented. Applications to data of other researchers give evidence of its value in predicting particle composition distribution at sizes similar or coarser than grain sizes. (Edited author abstract) 37 refs.

**074559 LIBERATION MODELING USING AUTOMATED IMAGE ANALYSIS.** A population balance model describing the combined processes of size reduction and mineral liberation has been developed for batch grinding. Important model parameters including breakage distribution functions, breakage rate functions, and liberation functions have been determined experimentally by examining the mill product using a Zeiss SEM-IPS image analyzer. Areal assays obtained from image analysis of monosized particle mounts correspond closely to the actual chemical assays. As a result of the model parameter analysis, breakage distribution functions have been found to be independent of the grinding environment, while breakage rate functions appear to be sensitive to it. The model has been validated by simulating the batch grinding of a sphalerite ore from Tennessee. Excellent agreement between the model predictions and the experimental results is observed for both monosized and multisized feed materials. (Edited author abstract) 21 refs.

**074560 DESIGN CONSIDERATIONS FOR LARGE DIAMETER BALL MILLS.** Large mill ( $D > 5.0$  m (16.5 ft)) performance has been predicted from small scale batch experiments for grinding kinetics and residence time distribution correlation for transport using population balance models. The effect of ball size must be properly taken into account in the scale-up. A design method that combined the kinetic scale-up findings and the transport of material through the mill has been developed. A computer program involving kinetic and transport considerations has been tested and found to be satisfactory for mill design purposes. (Author abstract) 26 refs.

**074561 COMMINATION OF MULTICOMPONENT FEEDS UNDER BATCH AND LOCKED-CYCLE CONDITIONS: KINETICS, SIMULATION AND ENERGY DISTRIBUTION.** The results of an

investigation of batch and locked-cycle dry grinding of quartz-calcite mixtures in a laboratory ball mill are presented. Batch grinding tests showed that the breakage rate function of the components is time-independent but composition-dependent and is normalizable with specific energy. Locked-cycle tests revealed that approximately 25 2-min cycles are required before the composition of the circuit product and the recycle material attains a steady state. The circulating load, after steadily increasing during the first 15 cycles, continued to fluctuate over a narrow range. These findings indicate that industrial-scale grinding circuits may also have long transient periods as the grindability of the ore changes and that circuits might be in transience perpetually. (Author abstract) 9 refs.

**074562 MULTICOMPONENT MODELS OF GRINDING AND CLASSIFICATION FOR SCALE-UP FROM CONTINUOUS SMALL OR PILOT SCALE CIRCUITS.** A multicomponent model of grinding and classification circuits as a scaling-up method is described. Steady-state test results of an ore are presented for continuously operated ball mills ranging from 0.6 to 4.4 m diameter. Simple translation of the specific breakage rates in the breakage rate-particle size ( $k-x$ ) plane enables an excellent estimate of the largest mill performance to be made from the smaller full scale mill and fair to reasonable estimates to be made from the two pilot scale mills. Ball size is the major, if not sole, cause for the variation in size interval for which the breakage rate was a maximum. A simple method for incorporating this effect into a scale-up procedure is presented. It is concluded that the functional form for the  $k-x$  relationship based on batch grinding tests is inadequate for testing heterogeneous ores under grinding conditions. The results are otherwise consistent with the scale-up relation of L.G. Austin. (Author abstract) 28 refs.

Weller, K.R. (CSIRO, Clayton, Aust); Sterns, U.J.; Artone, E.; Bruckard, W.J. *Int J Miner Process* v 22 n 1-4 Apr 1988, Recent Adv in Comminution, Conf Pap, Salt Lake City, UT, USA, 1987 p 119-147.

**074563 TRACER STUDY OF MASS TRANSPORT AND GRINDING IN A ROD MILL.** Residence time distribution experiments using radioactive tracers have shown strong particle size dependence of material transport in a continuous wet overflow rod mill. A new method for the determination of the size-dependent velocities and dispersion coefficients of the material has been developed. Earlier studies have shown that non-linear grinding kinetics prevail in rod milling operations, and a mathematical method to handle it has been previously suggested. By using these two methods, a non-linear distributed parameter model has been solved analytically and has been fitted to experimental size distribution data. The predictive capability of this model has been demonstrated. (Edited author abstract) 26 refs.

**074564 POTENTIAL ENERGY SAVINGS IN COMMINATION BY TWO-STAGE CLASSIFICATION.** Comminution normally consumes a large amount of energy in any mineral processing plant. One of the areas that appears to enable an appreciable saving of energy is the classification step in a closed ball mill circuit. Hydrocyclones are the major method for closing comminution circuits but employ only a single stage of classification. Thus, in each pass through the hydrocyclones, only 70-78% of the extreme fines are sent to product. A computer program named MODSIM permitted determination of results for the ball mill and hydrocyclone circuit as they influence each other. Energy consumption in kilowatt hours/ton of product was plotted against the product grind with parameters of circulating load. Grind utilized was percent +100 mesh. The flow-sheet employed

for two-stage classification was repulping of first-stage underflow with second-stage underflow returned as ball mill feed. Product was taken from both cyclone overflows. The feed was an ore similar to Kennecott's Utah operation for copper production with a rod mill discharge size distribution as feed to the circuit. All cyclone feeds were at 54% solids with hydrocyclone underflow maintained at 75 wt.% solids. As the grind increased in fines, the energy savings increased. As the circulating load increased, energy savings decreased. Energy savings ranged from 6% to over 30%. (Edited author abstract) 6 refs.

Dahlstrom, Donald A. (Univ of Utah, Salt Lake City, UT, USA); Kam, Wai-Ping. *Int J Miner Process* v 22 n 1-4 Apr 1988, Recent Adv in Comminution, Conf Pap, Salt Lake City, UT, USA, 1987 p 239-250.

**074565 RHEOLOGICAL EFFECTS IN GRINDING CIRCUITS.** The grinding efficiency of circuits using tumbling media mills in closed circuits with hydrocyclone classifiers may be improved by control of the mill slurry rheology. The rheology affects both the rate of fine material production by the grinding mill and the separation performance of the hydrocyclone. In addition, the manner in which rheology changes are produced will affect hydrocyclone performance. This parameter is neglected in process control situations due to the difficulty of making rheological measurements of dense slurries on-line. In recent years, a number of new viscometers have been developed which may be useful for this purpose. (Author abstract) 14 refs.

**074566 STOCHASTIC SIMULATION OF FILTERING AND CONTROL STRATEGIES FOR GRINDING CIRCUITS.** Random variations in the grinding circuit operating variables and their measured values complicate the dynamic analysis and automatic control of the circuit operation. A stochastic-dynamic simulator is presented for the purpose of testing various data filtering and circuit control strategies under actual noisy plant conditions. The simulator is flexible with respect to the circuit flowsheet and versatile for the implementation of additional noises, filters and control loops. It is applied to the evaluation of a conventional control strategy for a two-stage industrial grinding circuit and to the design of an adaptive Kalman filter for a closed laboratory grinding circuit. (Author abstract) 8 refs.

**074567 OPTIMAL CONTROL OF COMMINATION OPERATIONS.** Optimal control theory has had limited application in mineral processing practice. The reason for this has been the lack of accurate on-line models, the complicated nature of the mathematics and a lack of inexpensive computing power. In recent years progress has been made, especially in comminution. This paper reviews work at the Utah Comminution Center concerned with the application of optimal control theory to crushing, semiautogenous grinding and rod/ball mill grinding. The state of development ranges from computer-simulated to plant-tested. In all instances, the potential for improving upon classical control strategies is exceptional. (Author abstract) 18 refs.

**074568 PROGRESS IN ABRASION-RESISTANT MATERIALS FOR USE IN COMMINATION PROCESSES.** The wide range of materials used to resist wear in comminution processes is reviewed under the main

categories of special steels, non-metals, and alloyed white cast irons. Those process areas leading to the highest levels of wear are discussed in conjunction with the mechanism of abrasion and type of machinery and equipment utilized. Progress in the metallurgical development of high chromium white cast irons is highlighted. The physical properties in resisting wear are related to chemical composition and microstructure. Successful application and the financial benefits arising from the use of these alloys are demonstrated by reference to specific applications. An insight is given into the ongoing areas of research and practical aspects of development of high chromium cast irons with the emphasis on minimizing the cost of consumable wear parts. (Edited author abstract) 23 refs.

**074569 FIRST SURVEY OF GRINDING WITH HIGH-COMPRESSION ROLLER MILLS.** The special feature of high-compression roller mills is that a bed of particles is compressed between two rollers to a high solid density more than 70% of volume. The size reduction occurs by interparticle crushing. The milling force must be adjusted to a level so that the particle bed is loaded by a compressive force per unit area exceeding at least 50 N/mm<sup>2</sup> and in most practical cases being within the range between 100 and 300 N/mm<sup>2</sup>. The material leaves the mill as flakes which have to be deagglomerated in a succeeding operation. Nevertheless, both operations consume less energy than a ball mill. HC roller mills have less wear and reduce overgrinding. (Edited author abstract) 9 refs.

## Effluent Treatment

**074570 TECHNO-ECONOMIC EVALUATION OF THIOSALT TREATMENT PROCESSES.** Numerous processes for the treatment of thiosalts in base metal milling effluents have been examined in the past decade. Flowsheets for thirteen processes are outlined and cost estimates are presented for a base case of a 720 m<sup>3</sup>/h effluent flow containing 1400 mg/L thiosalts. The processes are ranked on the basis of capital and operating costs and chance of technical success. All costs are high and none of the methods has yet been proven to be consistently effective for large-scale treatment of actual effluents on a continuous basis. (Author abstract) 8 refs.

## Electric Breakdown

**074571 MECHANISM OF ELECTRIC DISCHARGE WEAKENING OF ORES.** The results of optical investigations of the surface of rare-metal ores weakened by electrical discharges are presented. It is shown that weakening of ore specimens by discharges is found in the development and broadening of existing microcracks and chips and in the formation of new ones. Furthermore, as a result of the effect of the pressure wave on the rock, shearing occurs with the formation of new surfaces, on which microparticles of the minerals are constantly present. **074572 DETERMINATION OF THE DIFFUSION COEFFICIENTS OF CuSO<sub>4</sub>, ZnSO<sub>4</sub>, AND NiSO<sub>4</sub> IN AQUEOUS SOLUTION.** The diffusion coefficients of

CuSO<sub>4</sub>, ZnSO<sub>4</sub>, and NiSO<sub>4</sub> in the aqueous solution systems of MSO<sub>4</sub> and MSO<sub>4</sub>-H<sub>2</sub>SO<sub>4</sub> were measured at 298 K using a diaphragm cell method and are listed as a function of molar concentrations of MSO<sub>4</sub> and H<sub>2</sub>SO<sub>4</sub>. It was found that the concentration dependencies of the diffusion coefficients in each single metal sulfate solution are similar. The presence of H<sub>2</sub>SO<sub>4</sub> generally causes a less significant concentration dependency of the diffusion coefficients of MSO<sub>4</sub>. The concentration dependencies of the diffusion coefficients of CuSO<sub>4</sub> in aqueous solutions of CuSO<sub>4</sub> and CuSO<sub>4</sub>-H<sub>2</sub>SO<sub>4</sub> are attributed to changes in the mean activity coefficient of CuS 4 and the viscosity of the solutions. ## Filtration

**074574 REDUCTION OF THE ENERGY REQUIRED FOR THE DEWATERING OF FINE-GRAINED ORE CONCENTRATES.** The separation of fine-grained solids from ore, coal and mineral concentrates is commonly accomplished with vacuum filters on a continuous basis. The desired residual moisture of the filter cake thus built, is however, frequently not achieved, so that additional energy-consuming accessory units are often required. Based on research work which has been carried out, engineering solutions leading to a more economical dewatering of difficult-to-filter beneficiation concentrates are presented. The mechanical dewatering of a filter cake by means of continuous pressure filtration is substantially more advantageous than the use of a combination of inadequate vacuum filtration and subsequent thermal drying. In addition to ascertaining the optimal operational conditions, new methods for avoiding shrinkage cracks in filter cakes have also been developed, and questions regarding the design of disk and drum filters have been investigated. (Edited author abstract) In German and English. 7 refs.

Anlauf, H.; Stahl, W. *Aufbereit Tech* v 28 n 6 Jun 1987 p 308-313.

**074575 VARIATION OF FILTER CAKE PERMEABILITY WITH MEAN PORE DIAMETER OF THE CAKE.** It is shown that most particles in a filter cake have more than only point contact with each other. Therefore, the Kozeny-Carmen equation is modified by relating permeability to porosity and a mean pore diameter as measured by automatic image analysis in horizontal cross sections of the cake. In filter cakes of chalcopryrite and magnetite, the permeability increases stepwise with the product of porosity and square mean pore diameter. (Author abstract) 22 refs.

**074577 RAW-MATERIAL-RELATED INFLUENCES ON BARITE FLOTATION.** The influences of specific surface and mineral composition on the flotation of primary and secondary barite raw materials are quantified. By the introduction of equivalent surfaces, which are determined by using X-ray diffractometry, the indirect technical measurement of the specific surfaces of the mineral phases and mineral groups involved is possible. A regression model for the evaluation of raw materials is derived which makes it possible to calculate the separation quality in advance. The influence of the absolute solids surface per unit volume of slurry on the flotation result is demonstrated and discussed. (Edited author abstract) In German and English. 34 refs.

Heinrich, G. (Technische Univ Berlin); Gock, E. *Aufbereit Tech* v 28 n 6 Jun 1987 p 301-307.

**074578 IMPROVEMENT OF THE FLOTATION BEHAVIOR OF QUARTZ AND KAOLINITE BY ADSORPTION OF Ca IONS.** The adsorption of Ca ions on finely ground quartz and kaolinite particles has been measured over a wide pH range at a concentration of 100 ppm of Ca in the slurry. A distinct parallelism was found between the pH-dependent adsorption of the Ca ions and the flotation recovery of quartz by using various fatty acids as anionic collectors. The adsorption of hydrolyzed CaOH<sup>+</sup> on Na-kaolinite causes coagulation. The coagulation occurs preferably under conditions where hydrolysis is observed. The zeta potential of Na-kaolinite was reversed at a pH of about 13. (Edited author abstract) In German and English. 7 refs.

Atesok, G. (Istanbul Technical Univ, Istanbul, Turk); Acarkan, N. *Aufbereit Tech* v 28 n 6 Jun 1987 p 314-321.

**074579 METHOD OF AUTOMATING SEMI-BATCH FLOTATION.** The present report describes a relatively simple, low-cost method of automation that can readily be implemented. A standard stainless-steel cell, which is operated in conjunction with a Denver flotation machine, has been modified by opening a narrow slot on one side and attaching a vertical glass tube 22 mm in diameter via a copper elbow. A length of plastic tubing is suspended with one end in the glass tube by hanging it from a vertical Plexiglass cylinder 150 mm in diameter, which is, in turn, connected to a 25-l polyethylene tank that serves as a reservoir for make-up water. The discharge from the tank flows into a spray nozzle that consists of a length of Plexiglass tubing with several small holes. Additional aspects of the experimental apparatus, test procedure and results are discussed. 7 refs.

**074580 DEVELOPMENT OF CONTACT ANGLES ON HEAZLEWOODITE.** There has been considerable controversy over the relative roles of adsorbed xanthate, metal xanthates and dioxanthogen in the flotation of sulfide minerals. The results of the electrochemical experiments reported here help to resolve this position as regards the flotation of heazlewoodite ( $\text{Ni}_3\text{S}_2$ ) by ethyl xanthate. The present work forms part of a wider study on the flotation response of nickel-bearing sulfide minerals. The separation of  $\text{Cu}_2\text{S}$  and  $\text{Ni}_3\text{S}_2$  is carried out industrially in the Inco separation process, the former being selectively floated with the use of diphenylguanidine; however, other than the observation that  $\text{Ni}_3\text{S}_2$  is floated by butyl xanthate over the narrow pH range 7-10, there appear to be no published data on the flotation of this mineral. 9 refs.

Critchley, J.K.; Hunter, C.J. *Trans Inst Min Metall Sect C* v 96 Sep 1987 p 165-168.

**074581 TESTS OF A NEW COLLECTOR FOR ORE FLOTATION.** A new reagent - a synthetic fatty acid amidoamine (BP-3) - is proposed as a collector for ore flotation. Data are presented concerning the selectivity of BP-3 on pure minerals, the separation of a quartz-feldspar product and the flotation of columbite and cassiterite from real process slurries. (Translated author abstract) In Russian.

Kurkov, A.V.; Molodkina, I.A.; Uskov, S.M. *Tsvet Met* n 5 May 1987 p 101-102.

**074582 PARTICLE SIZE DEPENDENCE IN FLOTATION DERIVED FROM A FUNDAMENTAL MODEL OF THE CAPTURE PROCESS.** A flotation model is described wherein particle collection is considered to occur by particle-bubble collision followed by the particle sliding over the bubble during which attachment may occur. Collisions are quantified by a collision efficiency  $E_C$ . The existing model for  $E_C$  is extended by including particle inertia. Attachment is quantified by an attachment efficiency  $E_A$  calculated as the fraction of particles which reside on the bubble for a time greater than the induction time. The model is examined and shown to agree with much experimental data. (Edited author abstract) 28 refs.

**074583 EFFECT OF TRACE METAL ION IMPURITIES ON THE HYDROXAMATE FLOTATION OF QUARTZ.** Hydroxamates are chelate-forming organic compounds that show selectivity for certain metal cations. The results reported in this communication illustrate how the presence of impurities, even trace quantities, can affect the flotation behavior of quartz when potassium octyl hydroxamate is used as the collector. Surface chemistry studies must be performed under conditions in which the absence of trace impurities can be guaranteed, otherwise interpretation of the results could ensue. 4 refs.

**074584 STUDIES WITH A DERIVATOGRAF OF THE PROPERTIES OF A WATER FILM ON A MARBLE SURFACE MODIFIED BY TETRACYCLAMMONIUM CHLORIDE (TDACl).** In mechanical mineral enrichment processing in aqueous media, mainly a flotation method is used. More than 60% of the minerals are concentrated by this method. The properties of water layers on bare marble and on marble samples covered with various amounts of tetracyclammonium chloride TDACl after flotation were investigated by thermal analysis methods. The dependence of the layer thickness, activation energy, enthalpy and entropy of the bonded water vs. the amount of TDACl previously deposited on the marble surface were determined. The results obtained and the literature data were used to propose an interpretation of the changes caused in these parameters by the coverage of the marble surface with

TDACl molecules. A correlation between these parameters and the changes in the water structure and marble flotability is also presented. 29 refs.

**074585 EFFECT OF COLUMN HEIGHT ON FLOTATION COLUMN PERFORMANCE.** The question is posed as to why columns typically have a collection zone 10 m high (H) by 1 m in diameter (D). Three geometry dependent factors are considered: degree of mixing,  $N_p$ ; volumetric bias rate, B; and volumetric gas rate, G. Increasing H:D decreased  $N_p$  and B which improves performance but decreases G which causes the column to approach overloading. Taking typical column operating conditions, it is concluded that a collection zone H:D of 10:1 is a reasonable compromise. (Author abstract) 10 refs.

Yianatos, J.B. (McGill Univ, Montreal, Que, Can); Espinosa-Gomez, R.; Finch, J.A.; Laplante, A.R.; Dobby, G.S. *Miner Metall Process* v 5 n 1 Feb 1988 p 11-14.

**074586 BUBBLE DIAMETER ESTIMATION IN A MECHANICALLY AGITATED FLOTATION MACHINE.** The photographic measurement of bubble diameter is tedious and restricted to vessels with transparent walls and relatively low bubble concentrations. A new method for predicting bubble diameter in a flotation column has been developed and confirmed by comparison with measured mean bubble diameter (Yianatos et al., 1987). Flotation columns are not mechanically agitated. This note describes an extension of this method to a mechanically agitated flotation machine. A recent publication by Szatkowski (1987) provided sufficient data to calculate bubble diameter by the proposed method and compare the estimates with values determined photographically. 4 refs.

Xu, M. (McGill Univ, Montreal, Que, Can); Finch, J.A. *Miner Metall Process* v 5 n 1 Feb 1988 p 43-44.

**074587 NEW CONCEPT IN FLOTATION COLUMN DESIGN.** A column flotation cell is described in which the contact between the feed and the air stream is made in a mixing device at the top of a vertical downcomer. The air-liquid mixture flows downward to discharge into a shallow pool of pulp in the bottom of a short cylindrical column. The bubbles disengage and rise to the top of the column to overflow into a concentrate launder while the tails are discharged from the bottom of the vessel. The main advantages of the device are that the overall height of the column is reduced to about 1 m (3 ft) and the column can be self-inducing with respect to the air supply. Experimental results are given from tests on a feed stream to a conventional zinc cleaner circuit. Using wash water to reduce gangue entrainment, the column gave high concentrate grades and high recoveries. (Author abstract) 4 refs.

**074588 ADSORPTION VON OLEAT AN CHROMIT UND OLIVIN.** [Adsorption of Oleate on Chromite and Olivine]. Oleate adsorption on chromite and olivine is an important phenomenon, since oleate is one of the leading surfactants used in chromite flotation. Adsorption studies were conducted to determine the effects of oleate concentration, solution, pH, and concentration of some modifiers, such as sodium fluorosilicate and carboxymethyl cellulose, on oleate adsorption of both minerals. The relationship between oleate adsorption and the electrokinetic potential of the minerals was also investigated under the above-mentioned conditions. Finally, the concentrations of dissolved ions in chromite and olivine solutions were determined to explain oleate adsorption and electrokinetic phenomenon. (Edited author abstract) In German and English. 11 refs.

Atak, S. v 28 n 12 Dec 1987 p 727-733.

**074589 CLEANING ACTION IN COLUMN FLO-**

**TATION FROTHERS.** Hydraulic entrainment of fine particles into the froth decreases concentrate grade in mechanical flotation cells. Flotation columns prevent hydraulic entrainment by maintaining a net downward flow of water through the froth. A study is presented of feed water penetration into the froth, a state that corresponds to the boundary (worst) condition of fine particle entrainment. Laboratory and plant scale tracer tests were performed to measure the amount of feed water entrained at different levels in the froth as a function of gas rate, bias (net downward water) rate and froth depth. The results show that the main cleaning action occurs close to the interface (< 10 cm) at moderate superficial gas rates (< 1 cm/s). The effects of gas rate and froth depth on the cleaning of the froth are more significant than that of the bias rate. Feed water is completely rejected at superficial gas rates of less than 1.5 cm/s with froth depths greater than 1 m. 14 refs.

**074590 PRINCIPLE AND APPLICATION OF RAMIFICATION CARRIER FLOTATION.** In this paper, the ramification-carrier flotation (RCF) of seven kinds of different ores, including wolframite, hematite, refractory copper ore, lead-zinc ore oxide, low-grade Cu-Mo sulfide ore, and Sb-As sulfide, are investigated. It has been shown that much higher recovery and better separation efficiency are achieved with RCF than with conventional flotation. In addition, for the RCF technology as compared with conventional carrier flotation (CCF), the overall reagent consumption is reduced and the difficulties of subsequent separation of the carried valuable ultrafine particle from the coarse carrier particles and the recovery of the carrier are obviated. The mechanism of the RCF process named the 'collision adhesion' model is suggested. In the model, the parameters influencing the RCF process are classified into the geometrical, physical and chemical factors. (Edited author abstract) 9 refs.

**074591 FREE JET FLOTATION OF OXIDE AND SULFIDE ORES IN THE ULTRA-FINE PARTICLE RANGE.** For flotation of fine particles with 100% approx. > 10  $\mu\text{m}$ , difficulties are experienced which, among others, can be attributed to adhering particles and the formation of agglomerates. Due to the density and character of the charges at the surfaces of these collectives, the equalizing of charges between the surfaces of the coarser and finer particles results in the formation of adhering particles which leads to a reduced ability of the surface of the solid to react. This results in product losses and/or a decrease in the selectivity of the sorting process. At the Technical University of Berlin, a free jet flotation cell has been developed for the flotation of ores of the finest particle ranges. The objective of the project is to test this cell for flotation of ores. The matrices floated were baddeleyite rough concentrate, sulphide lead-zinc ore, mercury ores containing graphite and sulfides, iron ore and tailings containing chromite. Concentrates of the required standard for further processing were produced in multi stage preflotation and cleaning flotation. (Edited author abstract) 9 refs. In German and English.

Atmaca, T.; Simonis, W. *Aufbereit Tech* v 29 n 2 Feb 1988 p 88-94.

**074592 COMPUTER SIMULATION OF STEADY-STATE FLOTATION FLOWSHEET.** A general steady-state flotation flowsheet simulator SIMFLOT based on the discrete distribution of the rate coefficient with low and high values presented by Kelsall is developed by the authors. Three basic modules, i.e. the mixer MIXER, the splitter SPLITR and the flotation bank FLBANK consisting of several modules ONECEL, are connected by the flowsheet topology matrix in SIMFLOT. So any flotation flowsheet with a random arrangement can be simulated by it. It is also developed that a program ESTIFLOT is used to estimate the parameters of models

in the SUMT method taking weighting square sums of differences between simulated and experimental values as the objective function. The data collected from the Dexing Copper Mine are taken as the normal condition of simulation. Then the parameters of models are estimated from data balanced by the material balance package CSIMBAL. The results of simulation are very satisfactory: The simulated and observed values for the recovery of copper in the final concentrate are 91.102% and 91.155%, respectively. (Edited author abstract) 9 refs. In Chinese.

**074593 SURFACE CHEMISTRY AND APPLICATIONS OF ALKYL HYDROXAMATE COLLECTORS IN MINERAL FLOTATION.** The published results of mineral flotation with alkyl hydroxamate collectors as investigated through adsorption studies and microflotation tests have been critically reviewed. Hydroxamate reagents chemisorb at the mineral/water interface, forming chelate complexes with the metal ions on the surface. The flotation response as a function of concentration and pH correlates with adsorption data. There exists a characteristic peak at pH 9 for both adsorption and flotation. This peak appears to be a result of two mechanisms of chemisorption, namely, the co-adsorption of adsorbate ions and molecules on the surface near the pK of the collector and the surface reaction between hydroxamate species and the cationic metal hydroxycomplexes at the mineral interface. (Edited author abstract) 55 refs.

**074594 AEROSOL FROTHER ADDITION IN COLUMN FLOTATION.** The objective of the laboratory work described in this paper has been to develop a method for producing small gas bubbles at moderate to high gas rates in a flotation column. Small bubbles are particularly important for attaining reasonable flotation rates of fine particles. An ultrasonic aerosol generator has been employed to add frother solution directly to the gas stream. Using porous glass and filter cloth spargers, aerosol frother addition has produced bubbles at  $\frac{1}{2}$  to  $\frac{2}{3}$  the diameter of those produced by conventional frother addition to the liquid, at a lower frother consumption. **074595 FLOTATION ACTIVITY AND THERMODYNAMIC ADSORPTION FUNCTION OF AROMATIC HYDROCARBONS.** A detailed study has been made of the flotation activity and thermodynamic adsorption functions of alkylated and polymethylated benzenes, with mono- and diisomeric substituents containing various functional groups (particularly halogens) in the benzene ring. The data shows that benzene is a poor flotation reagent for graphite, has the lowest adsorption capacity and is the least strongly adsorbed of all the hydrocarbons examined. Alkylation and polymethylation of the benzene improves its flotation activity, increasing both the adsorption capacity and the strength of attachment, and the differential heat of adsorption, free energy and entropy. Polymethylbenzene has the greatest flotation and adsorption capacities. Xylene and trimethylbenzene are more active than ethylbenzene or propylbenzene. 10 refs.

**074597 MISE A L'ECHELLE DES CIRCUITS DE FLOTATION.** [Scaling of Flotation Circuits]. This article presents an analysis of the possibilities of scaling the mechanically agitated flotation cells (agitation froth machines), by making use of the volume of the flotation cells as the only scaling factor. The assumptions made are described in detail. The proposed method is based on an analysis of the kinetic behaviour of the different species in flotation, such as the hydrophobic phases, the hydrophilic phases and water. The behavior of the hydrophilic phases is described in accordance with kinetics of the first order with distributed constants; that of the hydrophilic phases is an entrainment mechanism by the water; that of the water is attributed to two mechanisms, one associated with a maximum solids concentration in the froth which overflows and the other with a kinetic behaviour of the first order. The authors present the methodology which was used to effect the experimental calibration measurements. (Edited author abstract) 17 refs. In French.

**074598 INFLUENCE OF PARTICLE SIZE AND CONTACT ANGLE IN MINERAL FLOTATION.** The flotation behaviour of quartz particles whose surfaces have been hydrophobized to varying extents with an organosilane compound has been studied over the particle size range from 15 to 125  $\mu$ m in diameter under conditions of known bubble size and relative turbulent velocity. For a given particle size, there is a unique contact angle below which the particle will not float. This leads to the concept of a flotation domain, within which flotation is possible. Coarse particle behaviour is predicted by the kinetic theory of flotation proposed by H.J. Schulze, whereas there is only a qualitative agreement with A. Scheuldo's theory of fine particle flotation. Calculated induction times indicate that the attachment process is most efficient for particles of about 38  $\mu$ m in diameter under the experimental conditions. The dependence of rate constant on particle size was essentially linear. (Edited author abstract) 45 refs.

Crawford, Russell (Swinburne Inst of Technology, Hawthorn, Aust); Ralston, John. *Int J Miner Process* v 23 n 1-2 May 1988 p 1-24.

**074599 MODEL OF FLOTATION SELECTIVITY.** A mathematical model of the flotation process was developed having at least two features which can make it a useful tool for flotation analysis. First, the model includes physically meaningful descriptions of the inter-relationships between bubbles and particles in the flotation process. This makes the model a more reliable predictor of flotation result changes than a regression curve fitted to experimental data but having no causal meaning. Second, once the model is fitted to a given process, it simplifies a search for physical conditions optimizing that process. Computer simulations can be used instead of experiments or can be employed as screening tests before commencing an experimental program. The model can indicate where the process conditions are located with respect to the optimum conditions. 6 refs.

**074600 FROTH STABILITY, PARTICLE ENTRAINMENT AND DRAINAGE IN FLOTATION - A REVIEW.** The froth stability, entrainment and drainage of particles in flotation have been recognised as important factors which affect recovery and grade. A too stable froth is difficult to handle but an unstable froth is least desirable. Therefore, a froth of correct stability is of importance. However, the question is whether this phe-

nomenon is related to the frothing properties of a frother or to the physical, chemical and geometrical conditions of a system. The entrainment and drainage of particles in flotation are concerned with the pulp/froth phases. The paper deals with the current aspects on froth stability, particle entrainment and drainage based on a literature review. (Author abstract) 73 refs.

**074601 COLLECTORLESS FLOTATION AND SEPARATION OF SULPHIDE MINERALS BY  $E_h$  CONTROL.** The flotation of galena, chalcopyrite, and sphalerite has been studied singly and as mixtures in the absence of collector by  $E_h$  control. The collectorless floatability of each sulphide is directly linked to its ease of oxidation as well as to the stability of the hydrophobic surface state which is produced. The hydrophobic surface species may be elemental sulphur or a sulphur-rich metal-deficient surface. The ease of collectorless flotation follows the order chalcopyrite > galena > sphalerite. Measures of galena and chalcopyrite may be separated by  $E_h$  control provided that they are ground in a reducing environment. Under such conditions, their floatability is enhanced compared with the response of the minerals studied singly. (Edited author abstract) 42 refs.

Hayes, Robert A. (South Australian Inst of Technology, Aust); Ralston, John. *Int J Miner Process* v 23 n 1-2 May 1988 p 55-84.

**074602 INTERACTION OF GLYCINE AND A GLYCINE-BASED POLYMER WITH XANTHATE IN RELATION TO THE FLOTATION OF SULFIDE MINERALS.** The interaction between the amino acid glycine, a polymer (BA/13) with a glycine functional group incorporated into its backbone structure, and three sulfide minerals (chalcocite, galena and pyrite) was investigated using settling tests, electrokinetic measurements, and dissolution studies. The resulting increase in pulp stability and changes in zeta potential are related to the adsorption of metal glycinate complexes that form in aqueous solutions of the minerals. Chalcocite exhibited the greatest interaction with glycine due to the high stability of the copper glycinate complexes as compared to those of lead and iron. In flotation with xanthate as collector, glycine increased the floatability while BA/13 completely depressed all three minerals. (Edited author abstract) 10 refs.

**074603 COLUMN FLOTATION OF VERY FINE PARTICLES.** This work presents plant-site evaluations of six feeds comprising very fine particles (80% passing sizes 8-23  $\mu$ m). Five of the streams contained mainly sulphides (Mount Isa Mines Ltd, Australia) and one contained oxide minerals (Niobec, Canada). All the testwork was performed using pilot-scale columns. Column results were better than plant and laboratory results, giving concentrate grades up to 6% higher (in absolute terms) at the same recoveries. Entrainment into the column concentrate was measured by the recovery of the -10  $\mu$ m non-sulphide gangue fraction and recovery of feed water. Entrainment was lower in the column than for the mechanical cells and accounted for most of the improved performance. Some evidence of improved selectivity in the column was found. (Edited author abstract) 23 refs.

**074604 FROTH CHARACTERISTICS AND GRADE-RECOVERY RELATIONSHIPS IN THE FLOTATION OF LEAD-ZINC AND COPPER ORES.** Froth forms an important phase in flotation upon which the final yield parameters are dependent. Flotation froths

are three-phase froths and the solid particles exercise an influence in stabilizing or destabilizing the froths depending on the degree of hydrophobicity, size and concentration of fines. This paper deals with froth characteristics in flotation tests carried out on lead-zinc and copper ores with four different frothers. The results are analysed by grade-recovery relationships. (Edited author abstract) 22 refs.

**074605 FLOTATION COLUMN CARRYING CAPACITY: PARTICLE SIZE AND DENSITY EFFECTS.** The capacity of a flotation column can be limited by the rate of concentrate removal. There is a maximum rate at which solids can be removed related to individual bubble loading (surface coverage by solids (e.g. g/cm<sup>2</sup>)) and the bubble surface area rate (e.g. cm<sup>2</sup>/min). The maximum solids concentrate rate is referred to as the carrying capacity. A tentative model is presented to predict column carrying capacity ( $C_a$ ) as a function of particle size ( $d_{90}$ ) and particle density ( $\rho_p$ ):  $C_a = 0.068 (d_{90} \times \rho_p)$ . Evidence is presented suggesting  $C_a$  is independent of column diameter. (Edited author abstract) 7 refs.

**074608 CHOOSING A CATIONIC COLLECTOR.** Cationic collectors are used to float minerals that have a negative surface charge - primarily silica and silicates. Sometimes the material floated is the one being recovered as with feldspar, vermiculite and glass sands. Sometimes the material floated is a major impurity contaminating the ore being recovered as when silica is floated away from phosphates and from iron ore. In the flotation of potash from saturated brines, a cationic collector is used to float a sylvite (KCl) from halite (NaCl). The article examines each of these recovery situations.

**074609 HOLD-UP VOLUME AND MEAN RESIDENCE TIME MEASUREMENTS IN THE AIR-SPARGED HYDROCYCLONE.** In order to provide more information regarding flow characteristics in the air-sparged hydrocyclone, experiments were designed to determine the hold-up volumes of water and air inside the unit under typical operating conditions. The parameters of slurry flow, air flow, annular opening, and frother concentration were varied and the hold-up volumes of water and air and the corresponding residence times were

determined by collection of the cyclone's contents. In addition, the residence time distributions were measured using radioactive tracer and dye tracer techniques. The results indicate that the air-sparged hydrocyclone operates under choked conditions, at least half-filled with water. Such a situation arises when the annular opening is ten percent of the radius which corresponds to the swirl layer thickness developed for unrestricted swirl flow in a right-vertical cylinder. The measured mean residence time of water reporting to the underflow is in the range 0.5 to 1.0 seconds. (Author abstract). 7 Refs.

**074610 DEVELOPMENT IN THE CONTROL OF FLOTATION COLUMNS.** The major deficiency of present methods is that they rely on inaccurate and indirect measurements of the slurry-froth interface level and bias flowrate (the net downward flowrate of water through the froth phase). This generally means that excess wash water is added, with reduction in slurry residence time and column capacity. More accurate measurement of the temperature distribution in the froth phase are described. Control schemes based on these measurements are discussed. (Edited author abstract). 14 Refs.

**074611 COUNTER-FLOW FLOTATION CELLS (FLOTATION COLUMNS) - PRESENT STATE AND CURRENT TRENDS.** Since the beginning of the eighties flotation columns have been increasingly employed in industry, because, in general, the counterflow mode ensures a higher selectivity in comparison with conventional flotation machines. In addition, there are further advantages: the lower specific energy consumption, the lower floor space required, the lower investment and operating costs. In this paper, first of all, the performance and the essential operational parameters are characterized. Next, the present state of process modeling, performance of pilot tests as well as scale-up and process control are briefly discussed. Finally, industrial applications are presented, and new concepts and design variations of the equipment are considered. (Edited author abstract). 36 Refs.

**074612 INCO-VOLTAMMETRIC CELL: A NEW APPROACH TO FLOTATION MODELLING.** A new electrochemical cell was developed so that the impact of conditions during liberation could be related to mineral hydrophobicity. Mineral electrodes were polished in situ in the test electrolyte and allowed to achieve their rest potentials after aeration of the electrolyte. The procedure was designed to represent a grinding-flotation system and the hydrophobicity of chalcopryrite, pentlandite and pyrrhotite electrodes was found to be dependent on the following factors: (1) rate of increase in anodic potential following cleaning of the electrode; (2) presence of iron which causes galvanic coupling effects; and (3) pH variations during electrode cleaning; as well as other relevant variables (e.g. xanthate dosage). The observations made using the new cell favourably compared with flotation data. Mineral selectivity was a function of polarization of the particle surfaces and the rate of increase in the anodic potential of the pulp. (Edited author abstract). 17 refs.

**074613 INFLUENCE OF DIFFERENT GRINDING METHODS ON FLOATABILITY.** Investigations have been in progress since the middle of 1981 to prove and explain differences in the influence of conventional and autogenous grinding on the floatability of sulphide minerals. Techniques for liberation and particle shape studies under the microscope, and measurement of pulp chemistry as to redox potential and contents of free oxygen and

various sulphur-carrying ions were tested on samples from batch tests, pilot plant runs and commercial practice. The phenomena observed can partly be explained in terms of liberation and chemical characteristics of the pulp. (Author abstract) 10 refs.

Heating

**074614 MICROWAVE HEATING CHARACTERISTICS OF SELECTED MINERALS AND COMPOUNDS.** Naturally occurring minerals and reagent-grade compounds were tested to determine their receptivity to microwave heating. The maximum temperature achieved for the samples and the time required to reach temperature are reported. A description of the microwave oven and a thermocouple technique that accurately measures and continuously records the temperature of samples during irradiation are reported. Extractive applications using the generated microwave data were investigated. Stress fracturing at mineral grain boundaries in a gangue matrix was shown. This should affect grinding energy requirements and liberation properties. A method to produce a magnetic phase on pyrite surfaces, a method of using microwave heating to retort cinnabar concentrate, and a roast leaching microwave treatment of chalcopryrite ore are described. (Author abstract) 8 refs.

In Situ See Also COPPER ORE TREATMENT—Leaching.

**074616 ESTIMATING THE VERTICAL FLARING IN IN SITU LEACHING.** Flaring, the vertical excursion of leachant from an ore zone, is an economic and environmental detriment to all in situ leaches. Two measures characterize flaring: the rate of vertical fluid migration from the mineralized or ore zone and the volume of the barren zone swept at a given amount of injection. In this paper we investigate both aspects, the first through an analytical method and the second by numerical solution. The rate of fluid migration outside the ore zone increases with decreasing thickness of the ore zone and with flowpath length. To a lesser extent, it also depends on the location of the ore zone within the hydrologic zone. More centered ore zones show more excursion. The barren zone swept volume, which depends on these quantities, increases with the cumulative volume of leachant injected and with ore zone permeability. From these numerical results we develop a simplified procedure for estimating barren zone swept volume based on a sensitivity coefficient approach. The procedure yields answers that are generally within 10% agreement of numerical simulation, an accuracy that is within the precision of the variables upon which the barren zone swept volume depends. (Author abstract) 7 refs.

**074617 OXIDATION OF Fe(II) BY OXYGEN IN CONCENTRATED NaCl SOLUTIONS: PREDICTION OF STIRRED GAS-LIQUID REACTOR PERFORMANCE FROM HOMOGENEOUS KINETIC DATA.** Two kinds of experimental data have been used to identify separately: the kinetics of homogeneous reaction between the liquid reactant (ferrous chloride) and the dissolved gas (oxygen), the mass-transfer characteristics of a gas-liquid stirred reactor. The first set of data was obtained with a batch single phase reactor and very low ferrous concentrations; the second set, i.e. the product  $k_L a$  (mass-transfer coefficient times specific interfacial area) in the gas-liquid stirred reactor, was inferred from previous work using the same reactor and the system  $\text{Cu(I)/O}_2$ , and checked for our physical and chemical conditions. The results demonstrate that ferrous chloride oxidation by air or pure oxygen flow in a stirred reactor occurs in the regime of very slow or homogeneous reaction, according to the theory of absorption with chemical reaction: oxygen immediately reaches its solubility in the bulk of the aqueous phase, and the oxidation is far slower than the oxygen transfer. Gathering homogeneous and gas-liquid oxidation data lead the authors to propose an expression of the rate of homogeneous reaction. 22 refs.

**074621 OPTIMIZATION TECHNOLOGY FOR LEACH PAD LINER SELECTION.** Minimizing the loss of pregnant solution through the leach pad liner is obviously of paramount importance to the economic efficiency and environmental compliance of the heap leach operation. Losses through the liner are a function of the hydraulic conductivity of the liner material and the hydraulic gradient across the liner. This applies to both natural and synthetic materials. The hydraulic gradient across the liner is a function of the build-up of solution above the liner, which in turn is determined by the permeability of the heap material, the slope of the liner, the drainage path length and the leachate infiltration rate. A relationship incorporating each of these parameters and their effect on the hydraulic head acting on the liner has been developed in terms of the Dupuit criterion, assuming one-dimensional flow with vertical accretion. (Edited author abstract) 2 refs.

**074622 TOMOGRAPHIC COMPUTER PROGRAM WITH CONSTRAINTS TO IMPROVE RECONSTRUCTIONS FOR MONITORING IN SITU MINING LEACHATE.** The Bureau of Mines is investigating possible applications of geophysics to monitor leachate during in situ mining. Tomographic reconstruction of seismic or electromagnetic crosshole data appears applicable. The tomographic program BOMTOM (Bureau of Mines tomography) was used to investigate reconstructions with synthetic travel time data. The calculations confirmed that without constraints, crosshole data do not provide unique solutions. The solution is not determined solely by the data, but is also influenced by the velocity guesses starting the iterative solution procedure. BOMTOM uses the simultaneous iterative reconstruction technique (SIRT) with straight ray paths. The program is efficient in use of memory and can be run on a personal computer. A source code in FORTRAN is listed. A source code in BASICA and compiled executable codes in both languages are available from the Bureau's Twin Cities (MN) Research Center. **074623 STUDY BY SEM-EDS OF THE IN SITU DYNAMIC LEACHING OF MERCURY ORES.** The present work studies the surface evolution of cinnabar, when it is leached with HBr acid for different conditions. The dynamic in situ test has been studied by scanning electron microscopy and EDS techniques. According to the acid condition, time, and temperature, the HgS presents different mechanisms of dissolution, and the results prove that the cinnabar does not present 'memory effect', as proposed by other authors. **074624 PRECIPITATE FORMATION IN THE OXIDATION OF FERROUS IONS IN THE PRESENCE**

**OF THIABACILLUS FERROOXIDANS.** This report discusses the mechanism involved in the process of ferrous sulfate biooxidation in aqueous solutions. The main chemical reactions involved in the production of soluble and insoluble species have been investigated during growth of the culture. The work focuses on the times at which the principal reactions begin, how long they last and the relationship between various precipitates. A material balance has been made to verify the proposed mechanism. (Author abstract) 12 refs.

**074625 MICROBIAL ECOLOGY OF SOME INDIAN SULPHIDIC MINES.** In this paper, the physico-chemical characteristics of various Indian sulphidic mine waters are brought out. Various types of micro-organisms present in different mineral occurrences are discussed. Such microbial associations are discussed from the viewpoint of microbial ecology and the contribution of microbes in the conversion and oxidation of various sulphide minerals. (Author abstract) 33 refs.

**074626 BACTERIAL LEACHING OF A SULFIDE ORE BY THIABACILLUS FERROOXIDANS AND THIABACILLUS THIOOXIDANS: I. SHAKE FLASH STUDIES.** Bacterial leaching of a sulfide ore containing pyrite, chalcopyrite, and sphalerite was studied in shake flask experiments using *Thiobacillus ferrooxidans* and *thiobacillus thiooxidans* strains isolated from mine sites. The  $\text{Fe}^{2+}$ -grown *T. ferrooxidans* isolates solubilized sphalerite preferentially over chalcopyrite leaching 7-10% Cu, 68-76% Zn, and 10-22% Fe from the ore in 18 days. The sulfur-grown *T. thiooxidans* isolates leached Zn much more slowly and very little Fe, with a Cu-Zn extraction ratio twice the value obtained with *T. ferrooxidans*. The ore-adapted *T. ferrooxidans* started solubilizing Cu and Zn without a lag period. The ore-adapted *T. thiooxidans* extracted Cu as well as *T. ferrooxidans*, but the extraction of Zn or Fe was still much slower in the low-phosphate medium, while in the high-phosphate medium it approached the value obtained with *T. ferrooxidans*. A high Cu-Zn extraction ratio of 0.34 was obtained with *T. thiooxidans* in the low-phosphate medium. (Edited author abstract) 8 refs.

**074627 LINER DESIGN FOR HEAP-LEACH PADS.** Heap leaching of low-grade precious metal ores can be profitable. However, although the ore may be friable, the gold-bearing mineral leachable and the heaped ore permeable, if the pad on which the leaching is to take place leaks, sags or slides, there may be no returns. With this in mind, the authors discuss the various factors involved in designing a precious metal heap leach pad. 20 refs.

**074629 RECUPERACION DE COMPUESTOS DE CALCIO Y DE MAGNESIO DE ALTA PUREZA A PARTIR DE DOLOMITAS ARGENTINAS.** [Recovery of High-Purity Calcium and Magnesium Compounds from Argentine Dolomites]. From an Argentine dolomite of average composition  $\text{CaO} = 30.65$  percent;  $\text{MgO} = 20.18$  percent,  $\text{SiO}_2 = 1.97$  percent,  $\text{Fe}_2\text{O}_3 = 1.18$  percent,  $\text{Al}_2\text{O}_3 = 0.42$  percent, loss on ignition = 45.50 percent, calcium and magnesium compounds with a purity higher than 99 percent were produced. An excellent recovery was obtained using a hydrometallurgical route with selective dissolution of calcium with ammonium chloride, and then of magnesium, with carbon dioxide leaching. In practice, the dolomite carrier of calcium and magnesium is the only raw material required by the procedure, inasmuch as the reagents ammonium chloride and carbon dioxide are recovered during the process. **074630 BIOLIXIVIACION DE MENAS NATURALES. POSIBILIDADES ACTUALES DE UTILIZACION.** [Bioleaching of Natural Ores. Present Possibility of Use]. During the last few years, the industry related to metal extraction has been suffering a very important crisis the immediate cause of which lies in growing process costs, in lower metal prices, in problems related to atmospheric pollution, in poorer and poorer ores, in energy problems and in reserve exhaustion. So, in some particular cases, bioleaching may be an alternative to the classical hydrometallurgical process in view of the present difficult situation. A summary of the bioleaching situation is made in the present review. In the first place, the principal microorganisms used in both direct and indirect mechanisms through which reactions occur are described. Among these microorganisms, some mesophiles like *Tiobacillus* genus and some thermophiles like *Sulfolobus* genus stand out. Finally, after mentioning both the advantages and disadvantages of these processes, its more important industrial applications (copper and uranium bioleaching) and the ones with a more promising future (coal desulfurization and pre-oxidation of refractory pyrite ores containing gold and silver) are reviewed. (Edited author abstract). 60 Refs. In Spanish.

**074637 ELECTROCHEMICAL ASPECTS OF BIOLEACHING MULTISULFIDE MINERALS.** This paper deals with the various electro- and biochemical mechanisms involved in the bioleaching of multisulfide

minerals such as those containing copper-lead-zinc and copper-nickel-iron. The galvanic series for sulfide minerals consisting of pyrite, chalcopirite, galena, sphalerite, pentlandite, and pyrrhotite in an acid bacterial leaching system is illustrated and the role of relative electrochemical activity on selective dissolution is discussed. Typical leaching results are shown to illustrate the practical applicability of galvanic effects. Attachment of *Thiobacillus ferrooxidans* onto chalcopirite and sphalerite mineral substrates is illustrated through scanning electron micrographs. The role of high metal tolerant strains in the leaching of multimetal concentrates is also outlined. (Edited author abstract) 6 refs.

**Magnetic Separation** See Also TUNGSTEN ORE TREATMENT—Separation.

**074638 SUPERCONDUCTING MAGNETIC SEPARATOR AND ITS APPLICATIONS IN MINERAL PROCESSING.** In mineral processing, conventional magnetic separators are equipped with magnetic circuits (magnetic iron yoke with copper coils or iron clad solenoid) that develop magnetic fields of less than 2 T. For minerals of low magnetic susceptibility, use of these circuits has disadvantages. This paper describes a magnetic separator having a superconducting magnet with integrated closed circuit for helium liquefaction. The system generator and maintenance are simplified by automation realized by a programmable autocontrol unit. A comparative study of the results on concentration and purification of different raw materials with the new and with conventional separators is described. (Edited author abstract) 12 refs.

**074639 FUNDAMENTALS OF HIGH-INTENSITY MAGNETIC SEPARATION AS APPLIED TO INDUSTRIAL MATERIALS.** Either wet or dry separation has application in both the recovery and concentration of minerals and in removing deleterious mineral constituents. The various types of magnetic separators along with the design and operating parameters relative to separation response are characterized. The characteristics of specific minerals to magnetic collection and the production of high-grade concentrates are described. Laboratory, pilot-scale, and plant studies have demonstrated the effectiveness of magnetic separation as either a primary or a secondary unit operation to achieve product quality. (Edited author abstract) 4 refs.

**074640 FUNDAMENTAL STUDY ON CONTINUOUS HIGH GRADIENT MAGNETIC SEPARATION.** A ferromagnetic wire charged with alternating current in magnetic field ( $H_0$ ) perpendicular to an axis and with the overall gradient along its axis ( $dH/dx$ ) is horizontally vibrated by electromagnet force. The wire and the magnetic particles captured on it move relatively and the friction between them are reduced. The magnetic particles are transported to the place of the strongest magnetic field by magnetic force ( $F_{mx}$ ) and deposited there. When the upward magnetic force ( $F_{my}$ ) acting the particles becomes weaker than gravity ( $F_g$ ), the particles fall apart from the wire. On the basis of the above-mentioned principle, single wire experiments were conducted. The results obtained were as follows: As particles were transported in state of blocks, the moving velocity ( $V_p$ ) was larger than the value calculated about one particle. The moving velocity of particles were proportional to wire amplitude ( $Y$ ). When the wire fixed on both sides, therefore, is vibrated in first mode the particles are

transported more rapidly in central part than in the side. Wire amplitude is proportional to current; therefore the moving velocity of the particles is also proportional to it. The results of calculation indicated that the thickness of deposit layers ( $r$ ) which the particles fall apart from the wire could be predicted by the deposit layer model. (Edited author abstract) 10 refs. In Japanese.

Hasuda, Tetsuhiko (Nat'l Research Inst for Pollution & Resources, Jpn); Ogawa, Katsumi; Kitora, Yoshihisa. *Nippon Kogyo Kaishi* v 104 n 1200 Feb 1988 p 83-88.

**074641 SUPERCONDUCTING HIGH GRADIENT MAGNETIC SEPARATION.** Separation of materials by means of their differing magnetic properties has been used for many years in mineral dressing and waste processing. However, the technique's applicability has been limited by its inability to deal with small particles or weakly magnetic materials. The CSIRO Division of Applied Physics uses magnets operating at a temperature of  $-269^{\circ}\text{C}$  which offer a five-fold increase in magnetic field strength over conventional electromagnets. Such magnets extend the range of magnetic separation into the colloidal size range and to weakly magnetic materials at a reduced operating cost compared to ordinary electromagnets. The technique has been applied to recover fine particles of tantalite  $[(\text{Fe}, \text{Mn})(\text{Ta}, \text{Nb})_2\text{O}_6]$  as a concentrate from feed with a grade below 0.1 percent  $\text{Ta}_2\text{O}_5$ . Other applications are removing colored impurities in kaolin clays, separating blood components and cleaning effluent gases.

Anon. *Aust Min* v 80 n 5 May 1988 p 3p.

**074642 SELECTIVITY AND PRODUCTIVITY OF OGMS WITH ALLOWANCE FOR TWO FLOWS IN THE SEPARATION ZONE.** The separator extraction curves are discussed in the common reduced coordinates, which permits the selectivities of different open gradient magnetic separators (OGMS) to be compared. It is shown that in the real separators  $0.2 \leq S_{10} \leq 0.65$  for OGMS with wet separation process and  $0.2 \leq S_{10} \leq 0.83$  with dry process. The maximum selectivity is reached in the system with the constant of forces (isodynamical). The work also considers operation of the separators with two flows in the separation zone, i.e. when the pulp is introduced not close to the wall nearest to the magnetic system but at some distance from it. 6 refs.

**074643 MODELLING AND SIMULATION OF THE BOND WORK INDEX TEST.** In this paper, the Bond grindability test was systematically analyzed and studied by means of mathematical modelling and computer simulation. A rapid and accurate computer simulation method has been worked out for the determination of the Bond work index. Comparison of the test results of six ore samples showed that the simulation values of the Bond Work index of these ore samples were well approximated to the actual values. The simulation process printed out by the computer was consistent with the actual grindability test process. It generally takes about two minutes to complete the simulation process with the computer. This new method not only improves the accuracy of determination but also reduces a good deal of test time and work load for determining the Bond work index. (Edited author abstract) 10 refs.

## Oxidation

**074644 INFLUENCE OF TEMPERATURE AND MOLAR RATIO OF  $\text{PbSO}_4:\text{ZnS}$  ON THE RATE OF CHEMICAL REACTION BETWEEN LEAD SULPHATE AND ZINC SULPHIDE.** The chemical reaction between  $\text{ZnS}$  and  $\text{PbSO}_4$  at various molar ratios was studied by the thermogravimetric method. It was found that the reaction is multistage. Products of the first stage of the reaction contain mainly  $\text{ZnO}:\text{PbS}$  and  $\text{PbSO}_4$  in different amounts depending on the molar ratio of the substrates. The next stages consist in the action of  $\text{PbS}$  formed in the first stage with  $\text{PbSO}_4$ . It was found that the reaction rate depends on temperatures and on the  $\text{PbSO}_4:\text{ZnS}$  molar ratio (up to 3:1). The activation energy of the reaction was also determined. The value of the activation energy slowly increases with an increase in the  $\text{PbSO}_4:\text{ZnS}$  molar ratio. (Edited author abstract) 11 refs.

## Physical Chemistry

**074645 SOLUBILITIES OF BROMIDE SALTS OF ALUMINUM, COBALT, LEAD, MANGANESE, POTASSIUM, AND SODIUM WHEN SPARGED WITH HYDROGEN BROMIDE.** The effects of HBr concentration and temperature on the solubility and hydration state of  $\text{AlBr}_3$ ,  $\text{CoBr}_2$ ,  $\text{PbBr}_2$ ,  $\text{MnBr}_2$ ,  $\text{KBr}$ , and  $\text{NaBr}$  were investigated by the Bureau of Mines. Saturated aqueous solutions of the Al, Pb, K, and Na bromides were sparged with HBr gas at 20, 40, and  $60^{\circ}\text{C}$ , and saturated solutions of Co and Mn bromides were sparged at  $20^{\circ}\text{C}$ . Increased HBr concentration caused decreased salt solubility because of the common ion effect for all the investigated bromides except  $\text{PbBr}_2$ . Aqueous solubilities at  $20^{\circ}\text{C}$  were, in percent, 51.7 for  $\text{AlBr}_3$ , 53.2 for  $\text{CoBr}_2$ , 1.1 for  $\text{PbBr}_2$ , 59.6 for  $\text{MnBr}_2$ , 39.5 for  $\text{KBr}$ , and 47.4 for  $\text{NaBr}$ . At  $60^{\circ}\text{C}$ , the solubilities were, in percent, 53.3 for  $\text{AlBr}_3$ , 2.2 for  $\text{PbBr}_2$ , 46.0 for  $\text{KBr}$ , and 53.8 for  $\text{NaBr}$ . Solubilities in solutions sparged to HBr saturation at  $20^{\circ}\text{C}$  were in percent, 0.5 for  $\text{AlBr}_3$ , 42.0 for  $\text{Co}_2$ , 32.2 for  $\text{PbBr}_2$ , 21.0 for  $\text{MnBr}_2$ , 0.6 for  $\text{KBr}$ , and 0.3 for  $\text{NaBr}$ . At  $60^{\circ}\text{C}$ , the solubilities at HBr saturation were, percent, 1.8 for  $\text{AlBr}_3$ , 41.4 for  $\text{PbBr}_2$ , 1.3 for  $\text{KBr}$ , and 0.4 for  $\text{NaBr}$ .  $\text{PbBr}_2$  precipitated out to a minimum solubility of 27.2 pct at 28.7-pct-HBr concentration. Further increases in HBr concentration increased  $\text{CoBr}_2$  solubility because of the formation of bromide complexes.  $\text{PbBr}$  increased in solubility as HBr concentration increased. (Author abstract) 9 refs.

**074646 PHYSICAL CHEMISTRY OF THE PRECIPITATION STRIPPING PROCESS FOR REMOVING IRON (III) FROM CARBOXYLATE SOLUTIONS WITH DILUTE SULPHURIC ACID.** Precipitation stripping is a single-stage process for stripping a metal from a loaded liquid cation exchanger with dilute mineral acid while simultaneously precipitating a hydrolyzed phase. Iron(III) can be stripped from carboxylate solutions with dilute  $\text{H}_2\text{SO}_4$  (10-40 g/l) at  $100^{\circ}\text{C}$  under atmospheric pressure to give goethite or basic sulfates. The thermodynamics of the process are examined and equilibrium constants are estimated at  $25^{\circ}\text{C}$  and  $100^{\circ}\text{C}$ . For the formation of goethite and hematite, these constants are high at both temperatures. This indicates that iron(III) can only be extracted in reasonable concentrations by carboxylic acids before precipitates have nucleated or when the metastable phase  $\text{Fe}(\text{OH})_3$  is present. The sluggish kinetics of hydrolysis and precipitation favor extraction at  $25^{\circ}\text{C}$ . At  $100^{\circ}\text{C}$ , goethite and hematite precipitate more rapidly, which drives the precipitation stripping process to near completion. The structure of the iron carboxylate complexes within the organic phase is discussed along with the influence of these structures on the kinetics of stripping and the nature of the hydrolysis products. (Edited author abstract) 40 refs.

## Reduction

**074647 CARBOTHERMIC REDUCTION USING LIQUID METAL SOLVENTS.** The use of liquid metal solvents has broadened the application-potential of carbothermic reduction in the areas of ore reduction reactions and reactive separations. A properly chosen solvent permits pyrometallurgical reductions at temperatures far below those possible with processes that do not employ a solvent metal. Product contamination is inhibited as well. Further, solvated carbothermic reduction appears to consume substantially less energy than conventional electrochemical and metallothermic processes. (Author abstract). 69 refs.

## Screening

**074648 PRINCIPLES OF SCREENING IN THE RANGE 0.5MM TO 20MM.** In spite of numerous attempts to master the complexity of screening machines, the old saying that screening is an art, not a science, still holds very true. However, this does not imply that the correct choice of screen and/or screening media for a screening application is still a matter of guesswork - far from it. To date, so much experience has been gained that it is more a question of how many trials are needed before it performs to specifications than anything else. Today, polymer screen media - rubber or polyurethane - are, with rare exceptions, standard on metal mining screens worldwide, and on hard rock and sand and gravel screens in Western and Eastern Europe, Australia and South Africa. The only major market place yet to realise fully the benefits of polymer screen media is, curiously enough, the United States.

**074649 MODELLING OF SCREENING OPERATIONS.** This paper reviews the Ferrara-Preti screening model and shows that recent laboratory and pilot plant data validate this approach. The model predicts the partition curve (selectivity function) and therefore the product size distributions, given the feed size distribution. Some improvement in the application of the model concerning numerical solution of the equations and parameter estimation are indicated. Information is given on the influence of some operating conditions on screen performance. Some applications of the model to improvement of screening operations, sizing of screens, simulation of screening and integrated plant operations are discussed. (Edited author abstract) 19 refs.

Ferrara, G. (Univ of Trieste, Trieste, Italy); Preti, U.; Schena, G.D. *Int J Miner Process* v 22 n 1-4 Apr 1988, Recent Adv in Comminution, Conf Pap, Salt Lake City, UT, USA, 1987 p 193-222.

## Sedimentation

**074650 NUMERICAL MODELLING OF MULTI-PHASE PARTICULATE FLOW AND ITS APPLICATION TO SEDIMENTATION.** A numerical model has been developed to simulate the batch settling of a suspension of a particulate size distribution initially with a uniform concentration in a host fluid. The various particle size fractions are represented as separate phases with distinct concentration and velocities. This permits the larger particles to move to the bottom of the vessel and pack. As the particles settle, all but the smallest will not

penetrate the lower levels of the vessel. The packing behaviour is represented in detail via the approach of N. Ouchiya and T. Tanaka. The numerical implementation is based upon the control volume techniques elucidated by S.V. Patankar, although the algorithm contains a number of original features. The model is compared favourably with the experimental results of R.G. Holdich. (Author abstract). 28 refs.

**Separation** See Also COPPER ORE TREATMENT—Concentration; ORE ANALYSIS; SEPARATORS—Magnetic.

**074651 DESIGN AND APPLICATION OF A MODERN SOLID/LIQUID SEPARATION PLANT.** The industrial practice of concentration of solids and production of clear solids by gravity sedimentation (thickening) is an old technology and the most widely applied dewatering technique in mineral processing. The authors cover the basic theory of settling as well as the development of thickeners. They indicate applications of the Neyrtex high-rate thickener (Clariflux) and sludge compactor (Tasster) for the Southern African market. 3 refs.

Harries, Gavin (Neyrtex, S Afr); Jones, Colin; Milotte, Gerard. *S Afr Mech Eng* v 37 n 10 Oct 1987 p 481-485.

**074652 INDIUM RECOVERY FROM SULPHURIC SOLUTIONS BY SUPPORTED LIQUID MEMBRANES.** A supported liquid membrane (SLM) process was developed for indium recovery from industrial copper cross leach solutions up to a pre-pilot scale level (0.5 m<sup>2</sup> of membrane surface). The values of the separation factor for In/Cu (10<sup>4</sup>-10<sup>6</sup>) and the concentration factor for indium (400) are high. The order of magnitude of the indium flux through the membrane (g/m<sup>2</sup> h) can be favorably compared to those reported in the literature for other chemical systems. With regard to the life-time of the liquid film, the result relative to a feed solution containing only Cu, In and H<sub>2</sub>SO<sub>4</sub> show that it is stable enough to perform pilot runs of several weeks. In the case that the industrial solution is used, the extraction efficiency decreases with time. Some possible causes for this behavior were investigated; the use of a more selective extractant would probably minimize the problem. (Edited author abstract) 8 refs.

**074653 OPTIMAL DESIGN OF MINERAL SEPARATION CIRCUITS BY USE OF LINEAR PROGRAMMING.** A model is proposed for the simulation of mineral separation plants using linear programming. A mineral separation plant is described here by two linear models, one being a subset of the other. These models are solved in succession, the first producing the total flow rates between the banks and the circuit configuration, and the second the flow rates of mineral species. Circuit configurations produced by the simulation model are similar to those encountered in industry. This suggests the feasibility of applying the model in the design of separation plants in practice. The grades and recoveries obtained also closely resemble those of similar separation plants in industry. The only data required by the simulation models are the separation characteristics, tailings grade constraints and the feed rates. (Author abstract) 13 refs.

## Simulation

**074655 PROCESS AND PROCESS CONTROL DESIGN USING DYNAMIC FLOWSHEET SIMULATION.** The development of a mathematical description of a process plant requires coordination of information from conceptual design to operation management. The activities required to build and operate a process plant are divided into four basic chronological activities or phases. The activities are conceptual and flowsheeting; detailing around the P&ID; building and commissioning; and plant operation. The CAD system described provides a design tool to be used for each of these activities, as well as providing continuity between the activities and the disciplines involved. The heart of the system is dynamic simulation of the flowsheet. As an example, a series of carbon in pulp tanks for the adsorption of gold in solution has been chosen.

**074656 INITIAL TECHNOLOGICAL CONSUMPTION OF IMPERIAL SMELTING PROCESS AT HARIMA WORKS AND ITS LATER DEVELOPMENTS.** Harima Works was commissioned in 1966, introducing the Imperial Smelting Process (simultaneous zinc and lead smelting process) in Japan. Most part of the plant, however, was designed by Sumitomo utilizing accumulated technologies of its long and extensive experience in copper and nickel smelting operations. It was built as a smelter complex consisting of not only a sinter and ISF plant but also a zinc and lead refinery. The SO<sub>2</sub> gas is sent to the acid plant of a neighbouring chemical company. The ISF has a shaft area of 15.3 m<sup>2</sup> which is smaller than the standard one of 17.2 m<sup>2</sup> and the initial capacity was designed to produce 3000 T/M of zinc and 1500 T/M of bullion. The operation has been smooth and stable since the start-up. The production capacity has been stepped up to 6600 T/M of zinc and 2500 T/M of bullion with accumulation of various modifications and improvements through twenty years' operation. As a result, Harima Works has established its position as one of the most successful among the thirteen ISP factories in eleven countries in the world. (Author abstract)

## Solvent Extraction

**074657 EXTRACTION OF METAL IONS FROM AMMONIACAL SOLUTION WITH VARIOUS EXTRACTANTS.** Extraction of Cu, Ni, Co(II) and Co(III) from ammoniacal solution was carried out using Versatic Acid 10, D2EHPA, PC-88A, LIX64N, SME529 and KELEX100 as extractants in order to investigate the difference in extraction suppression by the extractants used. When acidic extractants such as Versatic Acid 10, D2EHPA and PC-88A were applied to the solution containing ammonia at high concentration, the strong extraction suppression was caused by the formation of stable metal-ammine complexes. Metal ions of Cu, Ni and Co were not extracted in the pH region of 7-9.5. On the other hand, the extraction suppression was weak and the extraction of Cu and Co(II) occurred in the pH range over 10 when chelating extractants such as LIX64N, SME529 and KELEX100 were used. (Edited author abstract) In Japanese. 15 refs.

**074658 EFFECTS OF VARIOUS ADDITIVES ON THE EXTRACTION OF Pr AND Nd WITH D2EHPA.** The extraction of Pr and Nd was carried out using D2EHPA as an extractant and by adding the additives TBP, TOPO and amine to the organic phase or the additives dimethylsulfoxide and dimethylformamide to the aqueous phase. The separation factor increases in D2EHPA/LIX63 and D2EHPA/BEHAA systems, while the additives except LIX63 and BEHAA cause a decrease in the separation factor. When the water soluble additives acetonitrile, dimethylformamide and dimethylsulfoxide are added to the aqueous phase, the extraction is strongly affected. The separation factor increases up to 5.06 in the extraction from a feed solution containing 70 vol% acetonitrile. (Edited author abstract) In Japanese. 8 refs.

**074659 SOLVENT EXTRACTION OF METALS WITH CARBOXYLIC ACIDS - THEORETICAL ANALYSIS OF EXTRACTION BEHAVIOUR.** This paper describes a new theoretical method for analyzing the behavior of metals during solvent extraction with carboxylic acids. A general solvent extraction equation which allows for extraction of partially hydrolyzed species solvation of the metal within the carboxylate complex and polymerization of the organic species is used. A general expression for the distribution coefficient is derived, taking into account complexation of the metal in the aqueous phase by inorganic ligands. This general expression is then used to generate sets of theoretical log D/pH curves for different parameters in the extraction equation. For a given set of experimental log D/pH data, the most probable values of the different parameters are deduced by curve-matching. The equilibrium constant for extraction is then found from the position of the experimental curve. Examples of the technique are given for Fe(III), Cu(II) and Zn(II). (Edited author abstract) 45 refs.

Pouillon, D. (Univ of California, Berkeley, CA, USA); Doyle, F.M. *Hydrometallurgy* v 19 n 3 Jan 1988 p 269-288.

**074660 SOLVENT EXTRACTION OF METALS WITH CARBOXYLIC ACIDS - COEXTRACTION OF BASE METALS WITH Fe(III) AND CHARACTERIZATION OF SELECTED CARBOXYLATE COMPLEXES.** The solvent extraction behavior of Fe(III) and various divalent metals with neo-decanoic acid, a tertiary C<sub>10</sub> monocarboxylic acid, has been examined in nitrate, chloride and sulfate solutions at 25°C and 60°C. Ni, Zn and Cu were coextracted with Fe, especially at relatively low pH; this effect was increasingly pronounced on going from nitrate to chloride and sulphate media. Co, Mn and Mg were also coextracted with Fe in sulfate solutions. UV/visible spectrophotometry indicated that Fe(III) forms mixed carboxylate complexes with Mn, Co and Ni, having Fe:M(II) ratios of 3:2, 2:1 and 2:1+3:1, respectively. Infrared spectrophotometry also gave evidence of these complexes along with a mixed Fe-Zn complex. Mass spectrometry suggested the existence of a dimeric Ni carboxylate complex, a trimeric Fe complex and a trinuclear mixed Fe<sub>2</sub>Ni complex. Thus, there appears to be a strong correlation between coextraction and the formation of mixed carboxylate complexes. (Author abstract) 23 refs.

Doyle, F.M. (Univ of California, Berkeley, CA, USA); Pouillon, D.; Villegas, E.A. *Hydrometallurgy* v 19 n 3 Jan 1988 p 289-308.

**074661 SEPARATION OF D2EHPA AND M2EHPA.** D2EHPA and M2EHPA were separated using selective precipitation and solvent extraction. When the precipitation technique was employed, M2EHPA was precipitated as its barium salt from the mixture, followed by regeneration of the alkyl phosphoric acids by contacting each component separately with acid. In the solvent

extraction method, many binary solvent systems were tested; of them, the ethylene glycol-kerosene system was found to be most suitable. The distribution coefficients of D2EHPA and M2EHPA in various solvent systems are reported and the selectivity of solvents for the alkyl phosphoric acids is discussed. (Author abstract) 11 refs.

**074662 VERFAHREN ZUR GEWINNUNG VON TANTAL, NIOB, URAN, YTTRIUM UND SELTENERDEN AUS KOMPLEXEN ERZEN.** [Process for the Recovery of Tantalum, Niobium, Uranium, Yttrium and Rare Earths from Complex Ores]. Using samples with samarskite and uranium containing micro-lite a process has been developed in which tantalum and niobium are dissolved by treatment with hydrofluoric acid under reducing conditions while uranium, thorium, yttrium and the radionuclides are enriched as difficultly soluble fluorides in the solution residues. The residual radium traces in the fluoride solution can be eliminated by barium sulphate collector precipitation. By means of subsequent solvent extraction, radiation-free tantalum and niobium products are obtained. Protactinium traces remain in the raffination residue or in the lime neutralisation product. In order to obtain a largely radiation-free yttrium/rare earth master product from the solution residues enriched with radionuclides, a process has been developed using sulfuric acid digestion, solvent extraction and oxalate precipitation. (Edited author abstract) 9 refs. In German.

Albrecht, Wolf-Wigand (Hermann C. Starck Berlin GmbH & Co, Goslar, West Ger); Schroeder, Klaus; Wolf, Ruediger. *Erzmetall* v 41 n 1 Jan 1988 p 36-39.

**074663 EFFECTS OF NON-AQUEOUS SOLVENTS ON THE EXTRACTION OF METAL ION WITH D2EHPA.** Extraction of metal ions from the aqueous phase containing non-aqueous solvents such as dimethyl formamide (DMF), dimethyl sulfoxide (DMSO) and acetonitrile (AN) was investigated by using di-2-ethylhexylphosphoric acid (D2EHPA) as an extractant. Extraction of Cu, Ni and Co increases by adding DMSO and DMF of less than 50 vol% and then decreases by the addition of more than 50 vol%. Extraction of Ag, Cr and Fe decreases with an increasing addition of DMSO and DMF, irrespective of its amount. Extraction of Mg and Al increases with an increasing addition of DMSO and DMF, regardless of its amount. The addition of AN does not cause a great change in the extraction except for Al and Ag, but extraction of Ag is decreased by the addition of AN. (Edited author abstract) 8 refs.

## Surfaces

**074664 ADVANCES IN CHARACTERIZATION OF ADSORBED LAYERS AND SURFACE COMPOUNDS BY SPECTROSCOPIC TECHNIQUES.** Spectroscopic techniques are becoming increasingly popular for characterizing the interior of adsorbed layers of surfactants and polymers at the solid-liquid interface as well as the identification of compounds on mineral surfaces. This review encompasses the application of fluorescence and ESR spectroscopic techniques to reveal the microscopic environment of the adsorbed layers with special reference to the adsorption of anionic surfactants (sodium dodecyl sulfate) and polyelectrolytes (polyacrylic acid) at positively charged alumina - water interfaces. The utility of XPS and auger techniques to identify the surface elemental composition of different mineral species is related to their flotation efficiency. (Edited author abstract) 33 refs.

**074666 PROFILE PREDICTION OF HYDRAULICALLY DEPOSITED TAILINGS.** An empirical investigation was conducted to formulate a design criteria for predicting the beach profile of hydraulically deposited tailings. Field data were obtained from mining operations producing gold sulfides, silver, molybdenum, copper, platinum, and uranium. Site-specific parameters were collected that included the beach slopes, tailings soil properties, slurry properties, and the slurry distribution system characteristics. Each of the beach profiles were dimensionlessly plotted and regression expressions were computed. It was determined that either a power expression or an exponential expression closely predicted each beach slope. A slope designation chart was developed as a function of the discharge, the tailings critical tractive shear stress, and the inertial forces exerted by the slurry on the beach. (Edited author abstract) 6 refs.

**074667 SIGNIFICANCE OF NATURAL GROUNDWATER RECHARGE IN SITE SELECTION FOR MILL TAILINGS DISPOSAL.** Assessing the occurrence of natural groundwater recharge at mine and mill waste disposal sites may be crucial to addressing regulatory agency concerns regarding the potential impact of waste seepage on groundwater resources. Recharge has been shown to occur even in semi-arid areas where annual lake evaporation exceeds precipitation. Permanent storage of waste seepage in the unsaturated zone is not to be expected if recharge occurs under natural conditions. Establishing the direction and rate of fluid movement in the vadose zone by field measurements is an important element that should be included in the site selection process. (Author abstract) 23 refs.

**074669 ENVIRONMENTAL IMPACTS OF AN OLD MINE TAILINGS DEPOSIT - METAL CONCENTRATIONS AND WATER PATHWAYS.** Variations in metal concentrations in a heavily polluted stream receiving acidic leachates from an old mine tailings deposit are analyzed from a hydrological perspective. From an extensive data material, collected during three years, the variations in concentrations of four metals (copper, zinc, cadmium and lead) are discussed. The deposit is the principal source for these metals in the watershed. The variation in metal concentrations in the vicinity of the deposit can to a large extent be explained by simple dilution of contaminated water with uncontaminated water from the surrounding area. Further downstream the deposit, other processes become increasingly important for the metal concentrations in the water bodies. (Author abstract) 17 refs.

Sanden, P. (Linköping Univ, Sweden); Karlsson, S.; Lohm, U. *Nord Hydrol* v 18 n 4-5 1987 p 301-312.

**074670 ENVIRONMENTAL IMPACTS OF AN OLD MINE TAILINGS DEPOSIT - METAL ADSORPTION BY PARTICULATE MATTER.** The distribution of metals (aluminum, manganese, iron, copper, zinc, cadmium and lead) between suspended particles and solution phase has been studied by analysis of time series data in a stream receiving leachates from a mine tailings deposit. A precipitation of aluminum and iron takes place when the acidic effluents are neutralized by unpolluted groundwater, while the other dissolved elements never reach saturation. The particulate fraction is largely amorphous. A transfer of dissolved elements from the solution phase to the particle phase, increasing in the order zinc < cadmium < copper < lead with increasing pH, is observed. This removal of metals from the aqueous phase appears to be due to sorption processes rather than to coprecipitation. (Edited author abstract) 20 refs.

Karlsson, S. (Linköping Univ, Sweden); Sanden, P.; Allard, B. *Nord Hydrol* v 18 n 4-5 1987 p 301-312.

**074671 BEACH CHARACTERISTICS OF MINE WASTE TAILINGS.** The Bureau of Mines surveyed waste disposal sites at 18 metal and nonmetal mines and conducted laboratory and full-scale field tests to determine the effects of tailings deposition techniques on physical properties of tailings pond beaches. Survey data included measurements of beach slopes, descriptions of deposition techniques, and measurements of beach physical properties taken at various distances from the point of discharge. Laboratory tests involved depositing two types of tailings, each with different grain size distributions, into a settling trough and determining the physical properties of settled materials along the length of the beach. Side confinement and the closeness of the water pool to the point of deposition caused the laboratory results to be inconclusive. Full-scale field deposition tests showed that there were similarities in relationships between exit velocities of tailings slurry and physical properties of the settled tailings. (Edited author abstract) 5 refs.

## Water Supply

**074673 STUDIES ON WATER RECYCLING IN MINERAL PROCESSING (3RD REPORT).** In previous papers, it was reported that a pilot plant was constructed to test for recovery of pure kaolin with a closed water recycling system, using kaolin ore of the Minami-shiraoi mine, Hokkaido. In the present paper, the authors carried out experiments to compare the results between the continuous operations of an open circuit system and operations of approximately 50% and 90% recycling ratio with a closed circuit system. The changes in the accumulated materials in the closed circuit system and the influence of these accumulations on performance was measured and examined. This report proposes simple models of the mass balance of materials and the flow pattern of the flows in each apparatus. (Edited author abstract) In Japanese. 14 refs.

**074674 EQUILIBRIUM ADSORPTION OF CHEMICAL VAPORS ON SURFACE SOILS, LANDFILLS AND LANDFARMS—A REVIEW.** The equilibrium adsorption of Volatile Organic Chemicals (VOCs) onto soils, such as occurring in surface soils, landfills and landfarms, is reviewed. On the basis of moisture content, soils can be classified into the 'dry', 'damp' and 'wet' categories. Increasing moisture content in dry soils is known to lead to displacement of adsorbed nonpolar VOCs. This review addresses adsorption models for the three soil moisture regimes. An extended Brunauer, Emmet, Teller (BET) adsorption theory is used and simplified isotherms are developed from it that enable the estimation of partial pressures of VOCs above soils. Available experimental data on VOC adsorption in the present context are also reviewed. (Author abstract). 56 Refs.

**074677 MICROBIAL DEGRADATION OF GUANIDINIUM ION.** Degradation of the cation was characterized by long and variable periods prior to enhanced microbial activity and was considerably slower than the degradation of the amino acid arginine. A carbon source could potentiate the degradation of guanidinium ion, in which case its carbon was mineralized and its nitrogen could be used for growth; but at nutrient levels in surface water, only slight mineralization of the cation's carbon was demonstrated and was considerably slower than that of urea carbon. Degradation of guanidinium ion by microorganisms capable of growing on it as a sole carbon source was estimated to be slow relative to two xenobiotic compounds. (Edited author abstract) 25 refs.

## Chemical Reactions

**074679 ACETALDEHYDE/ETHYL-ALCOHOL REACTION FOR A MEDIUM-LEVEL HEAT TRANSPORT SYSTEM.** An acetaldehyde/ethyl-alcohol reversible hydrogenation and dehydrogenation reaction is proposed for a medium-level heat transport system. Under atmospheric pressure the dehydrogenation converts heat at a temperature of 350-400°C to chemical energy. At another location chemical energy may be converted back, by the hydrogenation, to thermal energy at 200-250°C. For both reactions, the same silica-supported copper catalysts, particularly of ion-exchange type, have high activities and selectivities. A small amount of ethyl acetate is produced. However, the reaction producing ethyl acetate is also exothermic, so that the acetate only slightly decreases the amount of heat to be transported with this system. (Author abstract) 10 refs.

**074680 ATMOSPHERIC REACTIONS OF A SERIES OF DIMETHYL PHOSPHOROAMIDATES AND DIMETHYL PHOSPHOROTHIOAMIDATES.**

The kinetics of the atmospherically important gas phase reactions of a series of dimethyl phosphoroamidates and dimethyl phosphorothioamidates with OH and NO<sub>3</sub> radicals and O<sub>3</sub> were investigated at 296±2 K and approximately 740 Torr total pressure of air. Rate constants obtained for the OH radical, NO<sub>3</sub> radical, and O<sub>3</sub> reactions are given. These data show that for the dimethyl phosphorothioamidates both the OH and NO<sub>3</sub> radical reactions are important atmospheric loss processes, with calculated lifetimes ranging from 1 h to 1 day. The mechanistic implications of these data are discussed. (Edited author abstract) 26 refs.

**074681 GENERAL ACID CATALYSIS OF MONOCHLORAMINE DISPROPORTIONATION.** This paper presents experimental results showing that monochloramine disproportionation, which results in the formation of dichloramine, involves a general acid catalyzed reaction pathway. Rate constants characterizing the effect of hydrogen ion, phosphate, and sulfate were determined by measuring the rate of monochloramine disappearance under pH conditions, which simplified interpretation of results. These rate constants were used to develop a linear free energy relationship that was used to predict the effect of carbonate and silicate. Predictions indicate that carbonate, and possibly silicate, may significantly increase the rate of acid-catalyzed disproportionation at concentrations and pH values typical of many drinking waters. Study conclusions are discussed. (Edited author abstract) 17 refs.

**074682 HUMIC ACID COMPLEXATION OF CALCIUM AND COPPER.** High-affinity metal binding by isolated humic acids has been observed for both copper and calcium in metal titration experiments. Results of titrations of humic acids with a single metal (either calcium or copper) are consistent with a discrete ligand site model of humate-metal binding. However, copper titrations in the presence of excess calcium do not show competitive effects predicted excess calcium do not show competitive effects predicted by such a model. Hence, different ligand sites must be involved in calcium and copper binding, or a binding mechanism other than discrete ligand binding must be operative. (Author abstract). 31 Refs.

## Electronic Properties

**074684 CHEMICAL MODIFICATION OF SURFACES.** Bifunctional organic molecules that form bonds with a surface with one functional group give new properties to the surface with the other functional group. Adhesion to a surface or release from a surface can be improved by using this method. Preconditions for such chemical surface modification are the presence of reactive sites at the surface, the absence of impurities at these sites, and the possibility of stress relaxation on expansion and shrinkage. Subjects discussed include improvement of the adhesion between a photosensitive resist based on 'novolac' and silicon with an aminosilane, improved adhesion between noble metals and glass with a mercaptosilane, improved adhesion of silver reflecting coatings on Laser-Vision discs with tannin, an improvement of both adhesion and release in the replication method used for making aspheric lenses, using a methacryloxysilane and a trialkylsilane. The chemical surface modifications described for the replication method have been investigated by IETS and TOF-SIMS. The principles of these methods are discussed and results are presented. (Edited author abstract) 6 refs.

## Environmental Impact See Also MARINE BIOLOGY.

**074685 PREDICTION OF ORGANIC CHEMICAL FATES IN BIOLOGICAL TREATMENT SYSTEMS.** A coupled mechanism equation and related fate equations provide a basis for estimating organic compound fates from a single or a group of biological wastewater treatment systems. This approach can be used to correct existing treatability data for stripping and sorption processes and, in new treatability experiments, can provide for an indirect measure of the biotransformation rate mechanism. Use of existing data in the proposed equations suggests strong ecological subpopulation control and enzyme regulation effects resulting in major variations in biotransformation rates. Biotransformation rates are the most sensitive parameters in the fate prediction model. 14 refs.

**074686 CARCINOGENIC RISK OF SOME ORGANIC VAPORS INDOORS: A THEORETICAL SURVEY.** This exploratory report examines the risk of selected organic air pollutants measured in homes in the United States and the Netherlands. After several theoretical assumptions, estimates are made for the carcinogenic potency of each chemical; combined with the exposure measurements these give estimates of cancer risk. These estimates are compared with risks of these same pollutants outdoors and in drinking water and also with other well known indoor air pollutants: cigarette smoke, radon gas and formaldehyde. These comparisons indicate priorities for action. Some suggestions are made for future studies. (Author abstract) 60 refs.

**074687 DIETHYLHEXYLPHTHALATE AS AN ENVIRONMENTAL CONTAMINANT - A REVIEW.** Di(2-ethylhexyl)phthalate (DEHP) is a priority pollutant in several countries; annual production amounts to 3-4 million tons. Approximately 95% is used as a plasticizer in polyvinylchloride (PVC). DEHP is emitted to the environment during the production of plastics and plastic

products, during their use and after disposal. In the environment, physico-chemical degradation of DEHP is practically non-existent. Biodegradation occurs readily under aerobic conditions ( $t_{1/2} = 2-4$  weeks), but not under anaerobic conditions. The acute toxicity of DEHP to mammals is low. Many subchronic and chronic effects have, however, been identified. With respect to carcinogenicity the situation is uncertain, especially for some risk groups. The ecotoxicology of DEHP is especially relevant for aquatic communities where data are contradictory. Emissions of DEHP can be reduced by the biological treatment of wastewater and waste gas, the use of alternative plasticizers in PVC or the substitution of other plastics for PVC. (Edited author abstract) 89 refs.

**074688 CHEMISTRY AND PHOTOCHEMISTRY OF LOW-VOLATILITY ORGANIC CHEMICALS ON ENVIRONMENTAL SURFACES.** Hydrophobic organic xenobiotics such as polychlorinated dibenzodioxins (PCDDs) and polycyclic aromatic hydrocarbons (PAHs) have strong tendencies to sorb on environmental surfaces. Little is known about the heterogeneous chemistry and physical processes that affect the fate of organics on environmental surfaces. Because chemicals sorbed on soil surfaces or atmospheric particles are strongly exposed to sunlight, photochemical reactions are likely to be an important reaction pathway. This article discusses subjects covered in a recent two-day workshop in Alexandria, Va., on soil or sediment surfaces and on atmospheric particles. The workshop, which was sponsored by the EPA's Environmental Research Laboratory at Athens, Ga., and by the University of Nevada, Reno, brought together 20 scientists to discuss a wide variety of topics with a major emphasis on the environmental fate of chlorinated dioxins. 2 refs.

## Environmental Testing

**074689 DEVELOPMENT OF A METHOD FOR DETERMINATION OF METHYLENE CHLORIDE EMISSIONS AT STATIONARY SOURCES.** Prior to source sampling, laboratory experiments were conducted to determine the best sample container in which to collect an integrated sample. It was found that  $\text{CH}_2\text{Cl}_2$  remained stable in Tedlar bags for at least four weeks. The analytical method selected was gas chromatography with flame ionization detection (GC/FID). The range of concentrations from the sources was 100 ppm to 27,000 ppm  $\text{CH}_2\text{Cl}_2$ . A statistical analysis of samples collected simultaneously showed no difference in the samples, proving good precision in both sampling and analysis. Some of the sample bags returned from the test sites developed leaks indicating that immediate on-site analysis is best. A comparison of results obtained in the field and the two laboratories showed that inter- and intra-laboratory precision was within 10 percent. (Edited author abstract) 8 refs.

**074690 METABOLIC CONVERSION OF TOLUENE AND ETHYLBENZENE BY PACIFIC SALMON MICROSOMAL PREPARATIONS.** The aromatic fraction from crude oil has a substantial solubility in water and as a result makes up the major hydrocarbon components of processed ballast water. The purpose of this study was to investigate the metabolism of several of the major components of this processed water by Chinook salmon, *Oncorhynchus tshawytscha*, liver microsomes. The metabolic products of toluene and ethylbenzene in this microsomal system, as determined by gas chromatography-mass spectrometry, were benzyl alcohol and 1-phenylethanol, respectively. The conditions for the microsomal incubations were 20°C, pH 7.5, and an ionic strength of 0.126. A linear rate of benzyl alcohol and 1-phenylethanol formation is observed during the first 30

to 60 min followed by a decrease in the rate between 60 and 90 min. (Author abstract) 5 refs.

## Health Hazards See Also OCCUPATIONAL DISEASES—Monitoring; PIGMENTS—Chemistry.

**074693 OCCUPATIONAL ASTHMA CAUSED BY HIMIC ANHYDRIDE.** Twenty workers with exposure to himic anhydride power used for the manufacture of a synthetic flame retardant were questioned about respiratory symptoms. Three of the seven symptomatic workers who reported wheezing at work exhibited elevated specific immunoglobulin E (IgE) to two or more acid anhydride-human serum albumin conjugates. Radioallergosorbent inhibition studies performed with sera containing high levels of himic anhydride-human serum albumin specific IgE from a symptomatic worker demonstrated cross-allergenicity between himic anhydride-human serum albumin and hexahydrophthalic anhydride-human serum albumin allergenic determinants. This study demonstrated that himic anhydride can elicit IgE-mediated sensitization in the workplace. (Edited author abstract) 9 refs.

**074694 STATE OF SOME PHYSIOLOGIC INDICES IN THOSE EXPOSED TO DMFA.** Physiologic studies showed that DMFA-exposed practically healthy workers experienced a number of changes as to the central and peripheral nervous systems, some hemodynamic characteristics and elasticity of peripheral vessels. The earliest and most distinct signs of fatigue were noted among the men in charge of apparatus applying outer layers and through skin exposed to DMFA concentrations greatly exceeding MACs. Changes in a number of characteristics were noted earlier in men than in women.

Proceeding from the research results, the recommendations on the work/rest regulations were developed, short-term intervals for rest substantiated, and the sign 'dangerous for skin contact' introduced into normative documents. (Author abstract) In Russian. 3 refs.

## Purification

**074696 PURIFICATION OF ORGANIC CHEMICALS BY ZONE MELTING.** Purification of naphthalene and stearic acid by zone melting was studied. The effects of the crystallization velocity and mixing intensity of the melt on the purity of the crystal were investigated by applying the solution of the diffusion equation where the necessary boundary layer thickness was calculated from correlations in the literature. The calculated values are compared with experimental values. The results can be used for estimation of the optimum mixing intensity and crystallization velocity. (Author abstract). 13 refs.

## Separation

**074697 SEPARATION OF DILUTE AQUEOUS BUTANOL AND ACETONE SOLUTIONS BY PERVAPORATION THROUGH LIQUID MEMBRANES.** A simultaneous extraction-stripping process is proposed for separating volatile products from fermentation broths. It is based on pervaporation through a liquid membrane supported with a hydrophobic porous membrane. The liquid membrane prepared with oleyl alcohol was selected as the most suitable for separating volatile products resulting from acetone-butanol fermentation. Using the oleyl alcohol liquid membrane, the dilute aqueous butanol solutions of around  $4 \text{ g/L}$  obtained in acetone-butanol fermentation could be concentrated up to 100 times. The stability of this liquid membrane was also quite good as long as the surface tension of the feed solution was less than the critical surface tension of the support membrane. (Edited author abstract) 22 refs.

## Solubility

**074698 COMPARISON OF WATER SOLUBILITY ENHANCEMENTS OF ORGANIC SOLUTES BY AQUATIC HUMIC MATERIALS AND COMMERCIAL HUMIC ACIDS.** Water solubility enhancements of 1,1-bis(p-chlorophenyl)-2,2,2-trichloroethane (p,p'-DDT), 2,4,5,2',5'-pentachlorobiphenyl (2,4,5,2',5'-PCB), and 2,4,4'-trichlorobiphenyl (2,4,4'-PCB) by dissolved organic matter have been studied with the following samples: (1) acidic water samples from the Suwannee River, Georgia, and the Sopchoppy River, Florida; (2) a humic extract of a nearly neutral pH water from the Calcasieu River, Louisiana; (3) commercial humic acids from the Aldrich Chemical Co. and Fluka-Tridom Chemical Corp. The calculated partition coefficients on a dissolved organic carbon basis ( $K_{DOC}$ ) for organic solutes with water samples and aquatic humic extracts from this and earlier studies indicate that the enhancement effect varies with the molecular composition of the aquatic humic materials. Additional study results are discussed. (Edited author abstract) 14 refs.

**074699 PREDICTION OF AQUEOUS SOLUBILITY OF ORGANIC CHEMICALS BASED ON MOLECULAR STRUCTURE.** Correlations for aqueous solubility of a range of 200 environmentally relevant chemicals are derived from molecular connectivity indexes and a polarizability factor, calculated solely from molecular structure. The quality and reliability of the correlations are shown to be high enough for environmental applications, even with the minimum number of variables in the equations and without excluding any data to improve the correlations. The robustness and validity of these correlations are demonstrated by use of appropriate statistical techniques. A generalized predictive equation for aqueous solubility is recommended, which employs easily calculable molecular descriptors. (Author abstract) 20 refs.

**Sorption** See Also AQUIFERS—Chemistry.

**074701 SORPTION OF 8-HYDROXYQUINOLINE BY SOME CLAYS AND OXIDES.** The sorption of 8-hydroxyquinoline onto some clays and oxides was studied as a function of concentration, pH, and time. The sorption reaction reached equilibrium in about 5 hr, was irreversible, and reached a maximum at pH 5. The decrease in sorption on both sides of the maximum was attributed to electrostatic interactions of charged molecules with similarly charged surfaces and/or neighbors as well as solvent and proton competition. X-ray powder diffraction of dried clays showed that a one-layer complex formed in which the molecules lay flat between the clay interlayers. The sorption onto the clays included physical

and exchange sorption and was accompanied by exchangeable cation hydrolysis. At high surface coverage the silicate structure deteriorated in the direction of the Z-axis due to chemical aggressiveness of the reagent. (Author abstract) 13 refs.

**074705 IN VITRO AND IN VIVO TOXICITY: A COMPARISON OF ACRYLAMIDE, CYCLOPHOSPHAMIDE, CHLORDECONE, AND DIETHYLSTILBESTROL.** Four chemicals that had been tested in an *in vivo* toxicological screen were tested in a Chinese hamster ovary (CHO) cytotoxicity assay. Cell density, viability, ATP concentration, rate of protein synthesis, and cellular protein concentration were decreased by exposure to acrylamide (AC), chlordane (CHL), cyclophosphamide (CYC), and diethylstilbestrol (DES). Based on the *in vitro* toxicity rankings, DES and CHL were more toxic than AC or CYC. *In vivo*, the four chemicals were toxic following 10 daily treatments. While CYC was the least toxic chemical *in vitro*, it was one of the most toxic *in vivo*. Implications of the study results are discussed. (Edited author abstract) 45 refs.

**074708 EFFECTS OF ETHANOL ON THE HEMATOTOXICITY OF TWELVE PHARMACEUTICAL AND ENVIRONMENTAL AGENTS.** The ability of ethanol (5%) to potentiate the oxidant stressor effects of twelve well-known hematotoxic agents was investigated *in vitro* using human erythrocytes. Human whole blood was incubated with one of the following agents with and without ethanol for one hour at 37°C: o-aminophenol (0.05 mM); p-benzoquinone (4.0 mM); butyl nitrite (1.0 mM); p-hydroxyacetophenone (3.0 mM); hydroxylamine (0.5 mM); O,N-dimethylhydroxylamine (7.0 mM); 1,2-naphthoquinone (0.4 mM); 1,4-naphthoquinone (0.5 mM); p-phenylenediamine (5.0 mM); phenylhydrazine (1.0 mM); potassium nitrite (1.0 mM) and primaquine (8.0 mM). Methemoglobin (METHB) and reduced glutathione (GSH) levels were subsequently measured. Synergistic increases in METHB levels occurred for primaquine, 1,2-naphthoquinone and p-phenylenediamine incubated with ethanol ( $p < 0.05$ ). (Author abstract) 13 refs.

**074709 HYDROGENACE DICYKLOPENTADIEN V TRUBKOVEM REAKTORU SE ZKRAPENYM LOZEM KATALYZATORU.** [Hydrogenation of Dicyclopentadiene in a Tubular Reactor with Sprinkled Catalyst Bed]. Hydrogenation of dicyclopentadiene has been studied in a tubular reactor with sprinkled bed of a nickel-chromium catalyst. Values of the apparent activation energy have been deduced from experimental data. A power-law kinetic equation, supplemented by a correlation formula which respects the efficiency of catalyst wetting, was used in the design of a reactor and development of technology for hydrogenation of dicyclopentadiene to tricyclo-(5,2,1,0<sup>2,6</sup>)decane, an intermediate in the production of adamantane. The developed mathematical model of hydrogenation of dicyclopentadiene in a tubular reactor was used in a design of a plant-scale tubular reactor and in the development of technology for hydrogenation of dicyclopentadiene in the adiabatic regime. (Edited author abstract) In Czech. 29 refs.

**074710 ALUMINOSILOXANE AS A CERAMIC PRECURSOR.** Aluminosiloxane  $Al(OPr)_2(OSiMe_3)$  can be used as an organic precursor of gels and ceramics. Polymerization has been followed by SAXS and <sup>27</sup>Al NMR. The gelation results first from the formation of chain polymeric units with Al-O-Al linkages and secondly from the formation of mass-fractal clusters by aggregation of the chain units. During the ageing of the gel and the removal of the solvent, the chain structure turns into a three-connective polymer network. The heat treatment of the gels leads, after removal of volatile siloxanes, to transparent glass ceramics with a molar composition of about 92Al<sub>2</sub>O<sub>3</sub>-8SiO<sub>2</sub>. (Author abstract) 16 refs.

**074711 ON THE REMOVAL OF METALLIC MIRRORS BY FREE RADICALS.** Large radicals can be formed by passing chlorinated organic compounds at pressures of a few mm., through a furnace containing a pellet of sodium and heated to 350-400°C. It is found that the only radicals that will remove metallic mirrors (of tellurium or antimony, etc., previously deposited beyond the furnace) are those that can decompose into methyl or ethyl radicals plus an unsaturated molecule, without

undergoing any transmigration of atoms. The authors also found, especially in the case of larger monochlorinated molecules, that there was some decomposition, approximately half, even in the absence of metallic sodium. (Edited author abstract)

Rice, Francis Owen (Chemical Research Lab, Mishawaka, IN, USA); Tweedell, Joan. *Ber Bunsenges Phys Chem* v 91 n 10 Oct 1987 p 995-997.

**074712 ELECTRO-ORGANIC REACTIONS - XXX. CLEAVAGE AND COUPLING OF SOME BIOMASS-DERIVED ORGANIC COMPOUNDS.** The oxalate cathodic cleavage reaction has been applied to several biomass-derived organic substrates. Furfuryl alcohols and hydrofuroin undergo the expected deoxygenation reactions, but butane-2,3-diol is only deoxygenated by prior conversion into butane-2,3-dimethanesulfonate. The one-pot cathodic conversion of furfural into hydrofuroin, and thence into 1,2-difurylthene is described. (Author abstract)

**074713 DETERMINATION OF THE IONIC CHARGE OF SEMIQUINONES BY PULSED CONDUCTIVITY AND ESR TECHNIQUES.** Microsecond pulsed conductivity and ESR techniques have been used for unambiguous determination of the ionic charge on semiquinones derived from one-electron reduction of hydroxyquinones such as juglone, naphthazarin, sodium quinizarin-2-sulfonate and adriamycin. Irrespective of the presence of other charges elsewhere in the molecule, the radical centers of all the semiquinones have been shown to be mono-anionic at around neutral pH. The importance and significance of strong intramolecular H-bonding have been highlighted. Results on one-electron oxidation of naphthazarin have also been briefly discussed. (Author abstract) 18 refs.

**074714 EFFECTS OF BENZOTRIAZOLE AND 1,2,4-TRIAZOLE ON THE FORMATION OF ROUGH COPPER DEPOSITS UNDER REPETITIVE DOUBLE-PULSE ELECTRODEPOSITION CONDITIONS.** It was the aim of this work to study the effect of two organic compounds, benzotriazole (BTA) and 1,2,4-triazole (TA), on the surface morphology of copper deposits produced under repetitive double-pulse conditions. Copper adhesion coatings were electrodeposited on flat copper samples obtained by copper electrodeposition from sulfate bath with dc. It is shown that dendritic deposit growth ceases during the even pulses, since under these conditions the deposition rate is practically the same at all microprofile section. In repetitive odd pulses higher-order branching occurs. The rapid growth of the dendrites initially nucleated on top of the substrate microprojections leads to a fast redistribution of the mean rate of copper deposition away from the surface sections screened by dendrites; this is readily seen in transverse sections of the deposits. 1 ref.

**074716 INSERTION REACTIONS OF NITRILES IN CATIONIC ALKYLBI(CYCLOPENTADIENYL) TITANIUM COMPLEXES: THE FACILE SYNTHESIS OF AZAALKENYLIDENE TITANIUM COMPLEXES AND THE CRYSTAL AND MOLECULAR STRUCTURE OF  $[(\text{IDENYL})_2 \text{Ti}(\text{N-CMePh})(\text{NCPb})\text{BPh}_4]$ .** The cationic methylbis(cyclopentadienyl)titanium nitrile complexes are readily converted to the azaalkenylidene complexes as the products of a migratory insertion of nitriles into the Ti-methyl bond. The kinetics of the insertion reactions show a first-order dependence on the titanium alkyl and zero-order in the concentration of free nitrile. The reaction rates increase in the order  $\text{Me} < \text{t-Bu} < \text{Ph} < \text{n-Pr}$ . Bi(idenyl) complexes are more reactive than their cyclopentadienyl analogs, with reaction rates increasing for  $\text{R} = \text{t-Bu} < \text{Me} < \text{Ph}$ . The role of these complexes as models for the mechanism of the  $\text{Cp}_2\text{TiCl}_2/\text{AlR}_3$ -catalyzed polymerization of ethylene is discussed. (Edited author abstract) 42 refs.

**074718 PICOSECOND STUDY ON EXCIMER FORMATION IN PYRENE SINGLE CRYSTALS II. THE EXCIMER PRECURSOR STATE IN THE HIGH-TEMPERATURE PHASE.** Temperature dependent measurements of transient fluorescence spectra and fluorescence rise and decay times were performed in the high temperature phase of pyrene (155-300 K) with experimental response down to 15 ps. These prove the two-step excimer formation process via the precursor B-state as suggested in part I. The residual vibronic substructure in the B-fluorescence spectra indicates moderate electron-phonon coupling and partial self-trapping in the B-state. The B-state can be excited directly. Experiments with variable excess excitation energy show that this is not needed for excimer formation. There are good reasons that the B-state is the S<sub>1</sub>-state of pyrene. A kinetic scheme for the coupled energy relaxation processes has been applied providing kinetic rates and activation energies. (Author abstract). 18 refs.

**074719 ISOMERIC EFFECT OF EXCIPLEX FORMATION.** As well known, Weller proposed that the condition of  $I_A < I_D$  and  $E_A < E_D$  must be satisfied for the formation of exciplex. The interaction between the donor and acceptor are contributed by two parts. One is electrostatic force and the other is dispersion. In the case of  $I_D < I_A$ ,  $E_D < E_A$ , the former is very strong and the latter is weak. In this paper we report how to extract the latter interaction from a very strong electron transfer

system. Only the systems composed of ethylcarbazole-isomers of phthalate and carbazole derivatives-dimethyl-terephthalate are discussed in detail.

**074720 QUALITATIVE IR SPECTRAL ANALYSIS OF PRODUCTS ABSORBED FROM DITOLYLMEthane COOLANT BY SILICA GEL AND THE ABSORPTION ISOTHERMS.** In reactors with an organic coolant, as the energy output increases the pressure drop in the active zone increases as a result of impurities of harmful substances which enter the coolant during uptake and when the first loop is opened as well as because of the formation of harmful substances with the radiation-chemical transformation of the coolant. It is pointed out that the rate at which pressure drop increases decreases substantially when the organic coolant is filtered through a layer of attapulgus - an adsorbent, prepared from aluminosilicate clay. Because of this it was of interest to study qualitatively the products absorbed from an organic fuel. 6 refs.

**074721 REMOVAL OF HUMIC SUBSTANCE DISSOLVED IN WATER - I.** This study is concerned with the absorption properties of a fractionated humic substance at varying pHs on surface-treated carbon adsorbents. Activated carbon fiber (PF) made from phenol resin, Pittsburgh activated carbon (AC), and electronic conductive carbon black (EC) are used. The lower- (mol wt 100 to 1000 as polyethylene glycol (PEG)) and higher- (mol wt 1000 to 5000 as PEG) molecular-weight components are adsorbed well on PF and AC, having a large volume of micropores, and EC, being rich in mesopores, respectively. After the removal of surface polar substances from the adsorbents, we correlate the adsorptive capacity and the pore-size distribution. These results suggest that pore-size distribution is an important factor in removing humic substances effectively. (Edited author abstract) 28 refs.

**074722 INFLUENCE OF POTENTIAL ON THE ADSORPTION PARAMETERS OF ANILINE ON MERCURY.** The parameters for the adsorption of aniline molecules from neutral sodium sulfate solutions were calculated. The adsorption energies of the molecules were estimated for the first time over a wide range of potentials for each of the orientations assumed to be jointly present in the adsorbed layer. The influence of potential on coefficient B<sub>2</sub> of the isotherm for flat orientation can be described satisfactorily in terms of the Frumkin theory. Changes in base-electrolyte concentration could be accounted for, merely by taking into account the change in activity coefficient of the organic material which occurs due to the salting-out effect. (Author abstract) 22 refs.

**074724 INTERACTIONS OF COMPOUNDS ADSORBED ON AN 80%  $\alpha$ -CYCLODEXTRIN-SODIUM CHLORIDE MIXTURE INVESTIGATED BY DIFFUSE REFLECTANCE AND LUMINESCENCE SPECTROMETRY.** The interactions of  $\alpha$ -cyclodextrin-analyte responsible for the luminescence phenomenon observed from compounds adsorbed on an 80%  $\alpha$ -cyclodextrin-sodium chloride mixture were compared with the interactions of the prepared solid-phase  $\alpha$ -cyclodextrin complexes of the compounds. The diffuse reflectance spectra of several compounds adsorbed on an 80%  $\alpha$ -cyclodextrin-sodium chloride mixture and on NaCl were compared. Some of the compounds showed a red shift in their reflectance band maximum, and other compounds showed well-resolved vibronic bands on the 80%  $\alpha$ -cyclodextrin mixture. (Edited author abstract) 28 refs.

Bello, J.M. (Univ of Wyoming, Laramie, WY, USA); Hurtubise, R.J. *Anal Chem* v 59 n 19 Oct 1 1987 p 2395-2400.

**074725 DISCUSSION OF THE BEHAVIOR OF 2-ACETYL-5-BROMOTHIOPHENE AT THE MERCURY/AQUEOUS SOLUTION INTERFACE IN TERMS OF PHASE TRANSITIONS IN MULTISITE ADSORPTION OF FLAT LATTICES.** In the discussion of experimental adsorption isotherms of 2-acetyl-5-bromothiophene on mercury which consist of two steps, model concepts involving a phase transition in an adsorbed layer of molecules in flat positions without reorientation are used. Results obtained when measuring adsorption values, electrode capacitance, and electroreflectance spectra and estimates obtained with the aid of molecular models are in harmony with these concepts. Apparently for the first time we have experimentally detected the transition of organic molecules from a chaotic arrangement to an orderly arrangement in an adsorbed layer at the metal/solution interface. (Edited author abstract) 8 refs.

Ershler, A.B. (Acad of Sciences of the USSR, Moscow, USSR); Levinson, I.M. *Sov Electrochem* v 23 n 3 Mar 1987 p 330-337.

**074726 RELATION BETWEEN ADSORPTION PARAMETERS AND ELECTRONIC STRUCTURE OF ORGANIC ADSORBATES.** The authors have made an attempt to correlate the energy parameters of the molecules with the adsorption properties, and to analyze certain adsorption parameters of organic substances on this basis. The calculations were performed with the Huckel method. It is shown that the acid molecules contain two oxygen atoms, one hydroxylic and one of the ester-type. Here the electron density is more highly concentrated at the ester oxygen atom. It increases with increasing length of the carbon chain, but that at the hydroxylic, oxygen decreases, i.e., the hydrophilicity of

the ester atom increases. The molecules of all the acids considered have an excess of electrons, and this excess decreases with increasing chain length. 7 refs.

**074728 POTENTIAL- AND pH-DEPENDENT ADSORPTION OF ANILINE ON SILVER AS EVIDENCED WITH SURFACE ENHANCED RAMAN SPECTROSCOPY.** The potential- and pH-dependent adsorption of aniline on silver has been studied using Surface Enhanced Raman Spectroscopy. Different orientations of the adsorbed aniline depending on the composition of the electrolyte solution and the potential of the electrode have been identified based upon occurrence and band-shift of characteristic Raman bands corresponding to modes of the adsorbed molecule related to the molecule-electrode interaction. In neutral electrolyte aniline is adsorbed via Ag-N interaction at potentials positive to the potential of zero charge, at potentials negative to the pzc this coordination is changed to a more edge-on one. In acidic solutions the anilinium-cation is adsorbed flat by interaction of the aromatic electron system and the electrode as well as edge-on. (Author abstract) 31 refs.

**074729 UNTERSUCHUNGEN ZUR ADSORPTION BI- UND POLYFUNKTIONELLER ORGANISCHER SAEUREN AN ALUMINIUMOXID.** [Investigation of the Adsorption of Bi- and Polybasic Organic Acids by Alumina]. This paper deals with the adsorption of citric acid, tartaric acid, lactic acid and oxalic acid, resp. as well as malic acid and hydrochloric acid on  $\gamma$ -Al<sub>2</sub>O<sub>3</sub>. Errors, which arise from the analytical determination of the loading in consequence of the adsorbent porosity are adjusted by a pore correction. The adsorption of the first four acids can be described best by the Langmuir isotherm equation and that of the last two acids by a three-parameter equation. Relations between the parameters of the Langmuir isotherm and the composition of the appropriate aluminium complexes in aqueous solution are discussed and proposals for the structure of the formed complexes are given. (Edited author abstract) In German. 22 refs.

**074731 COMPARISON OF ADSORPTION PARAMETERS IN DIFFERENT ISOTHERMS.** The objective of this work is to provide a method of interconversion for the isotherm parameters and to propose a unified, rational scale for the standard free energies of adsorption. The authors report adsorption parameters for certain compounds on bismuth which were calculated with the use of different isotherms. The method proposed in this work for expressing the free energies of adsorption calculated via different isotherms proves to be a most appropriate method for obtaining comparable data, since the adsorption energies can be compared under the condition of identical standard states. 8 refs.

Past, U. (Tartu State Univ, USSR); Alumaa, A.; Palm, U. *Sov Electrochem* v 23 n 4 Apr 1987 p 527-530.

**074732 ADSORPTION OF THIOPHENE AND THIOPHENYLAMINE ON BISMUTH.** The adsorption of thiourea (TU) and its derivatives is characterized by strong interaction of their molecules with the electrode surface. It is of interest in this connection to elucidate the importance of a sulfur atom in the ring of an organic molecule. To this end we studied the adsorption of thiophene (TP) and thiodiphenylamine (TDPA) on the bismuth electrode in this work. It is shown that the adsorption of TDPA (thiodiphenylamine) from butanol, like that of aromatic hydrocarbons from alcohols is characterized by the presence of two adsorption regions. A comparison of the shape of the (C - C<sub>0</sub>) vs E curves obtained in TDPA and anthracene adsorption reveals a number of differences in their adsorption behavior. On the negatively charged surface where adsorption chiefly occurs on account of a displacement of the adsorbate molecules from the bulk solution, the adsorption effect of the saturated TDPA solution owing to its higher concentration is larger than that of the saturated anthracene solution. 13 refs.

**074734 ADSORPTION OF THIOUREA AT THE POLYCRYSTALLINE SILVER ELECTRODE FROM AQUEOUS KF SOLUTIONS - II.** The Frumkin adsorption isotherm parameters and the virial isotherm parameters are determined from the earlier published experimental data on double layer differential capacity measurements of polycrystalline silver electrode in aqueous KF solutions containing thiourea using the Parsons analysis. Thiourea is also used as the probe dipole to evaluate the electrostatic parameters of the inner layer. (Edited author abstract) 11 refs.

Milkowska, Magdalena (Univ of Warsaw, Warsaw, Pol). *Electrochim Acta* v 33 n 1 Jan 1988 p 161-163.

**074735 ON APPLYING THE IDEAL ADSORBED SOLUTION THEORY ON MULTICOMPONENT ADSORPTION EQUILIBRIA OF DISSOLVED ORGANIC COMPONENTS ON ACTIVATED CARBON.** Multicomponent adsorption equilibria of organic components from aqueous solutions on activated carbons were

measured and the applicability of the ideal adsorbed solution (IAS) theory was tested. Systematic deviations between experiments and theory were observed. Adsorbed phase activity coefficients which account for these deviations proved to be thermodynamically inconsistent. However, the calculation of spreading pressure in the IAS theory requires extrapolation of single solute isotherms to zero concentration. A correction of extrapolation errors was determined by fitting binary equilibrium data to the IAS theory. For a mixture of N components, N-1 constants have to be obtained from binary mixtures of N-1 components with a reference component. This work is pertinent to the treatment of industrial waste-waters and for the purification of the effluents. (Edited author abstract) 25 refs.

Seidel, A. (Acad of Sciences of GDR, Berlin, East Ger); Gelbin, D. *Chem Eng Sci* v 43 n 1 1988 p 79-89.

**074736 ADSORPTION, ORIENTATION, AND POLYMERIZATION OF 1-OCTYNE-3-ol ON IRON. AN ELLIPSOMETRIC STUDY.** The initial adsorption, structural transition, and polymeric growth of 1-octyne-3-ol on iron electrode from sulfuric acid solutions have been examined by using time-resolved in situ automatic ellipsometry. The adsorption occurs in two different configurations, flat and partly upright. The structural transition of the adsorbed octynol molecules is characterized by a large time constant indicating adsorption-reorientation mechanism. The linear growth of the polymer layer together with the current oscillations for hydrogen evolution reaction suggests a thin porous loosely bonded structure. The optical properties are related to the small conjugated units within the compact domains of the film. (Author abstract) 20 refs.

Jovancicevic, V. (Texas A&M Univ, College Station, TX, USA); Yang, B.; Bockris, J.O'M. *J Electrochem Soc* v 135 n 1 Jan 1988 p 94-98.

**074737 SORPTION OF PHOSPHINE FROM ACETYLENE BY ACTIVE CARBONS.** The results of the authors' experiments, in which 11 brands of domestic and foreign active carbons were tested during purification of phosphine, hydrogen sulfide, and arsine from acetylene, are in agreement with the data in the literature on the whole. The experiments were conducted in a dynamic column containing 11 cm<sup>3</sup> of carbon bypassing acetylene through the column at the rate of 0.25-0.71 m/min. It is found that SKT carbons, on contrast to other types of carbons, exhibit elevated adsorption-catalytic activity with respect to phosphine, converting it into nonvolatile and nontoxic phosphoric acid. A high concentration of water in the carbons and preliminary treatment with acids, particularly sulfuric acid, stabilizes the properties of SKT carbons. 8 refs.

**074738 STUDY OF SORPTION OF MONOETHANOLAMINE AND ITS COMPLEXES WITH COPPER(II) AND CADMIUM(II) IONS ON HYDRATED ZIRCONIUM DIOXIDE AND ITS MODIFIED FORMS.** Study of sorption of monoethanolamine on H and Me forms of hydrated zirconium dioxide in relation to the pH of the equilibrium solution and the nature of the modifier cation and of the outer-sphere anion showed that HZD is sorbed on Me forms of HZD both by ion exchange and by ligand-exchange mechanisms. Sorption of MEA is greater on HZD in the Me form than in the H form, and depends on the content and nature of metal ions in the sorbent. Sorption of MEA and of its complexes with copper(II) ions on the CuSO<sub>4</sub>(4) form of HZD was

accompanied by desorption of copper(II); this suggested the possibility of separating monoethanoamine complexes of copper(II) and cadmium(II). 13 refs.

**074740 MODELING ACTIVATED CARBON ADSORPTION OF TARGET ORGANIC COMPOUNDS FROM LEACHATE-CONTAMINATED GROUNDWATERS.** A relatively straightforward mathematical modeling technique employing a modified homogeneous surface diffusion version of the Michigan Adsorption Design and Applications Model was used to simulate and predict fixed-bed adsorber behavior with respect to two target organic compounds in a complex background water contaminated by leachate from a hazardous waste landfill. The unspecified dissolved organic matter in the leachate reduced granular activated carbon adsorption capacities and rates for both target compounds relative to their respective values in waters containing no other organic species. A short-bed adsorber technique was employed for estimation of system-specific rate parameters. (Edited author abstract) 31 refs.

Smith, Edward H. (Univ of Michigan, Ann Arbor, MI, USA); Weber, Walter J. Jr. *Environ Sci Technol* v 22 n 3 Mar 1988 p 313-321.

**074741 INFLUENCE OF AN ELECTRIC FIELD ON ADSORPTION OF ORGANIC SUBSTANCES - II. APPLICATION OF THE MODIFIED MODEL OF TWO PARALLEL CONDENSERS TO ETHYLENE GLYCOL SOLUTIONS.** The data for ethylene glycol (EG) solutions containing normal alcohols recently reported are analyzed in the light of the model presented in recent papers. The effective dipole moment of an adsorbed molecule at vanishing and at maximum coverage is evaluated. The previous assumption of a flat orientation of the adsorbed molecules is strongly supported by a correlation between the variations of the interaction coefficient with potential and other adsorption parameters. Another correlation is found between the effective dipole moment and the dielectric constant of the surface layer at maximum coverage. The results are explained by hydrogen bonding between the polar heads reducing the effective dipole moment. (Edited author abstract) 15 refs.

Schuhmann, D. (CNRS, Montpellier, Fr); Vanel, P. *Electrochim Acta* v 33 n 3 Mar 1988 p 425-432.

**074742 REACTIONS OF ORGANONITROGEN MOLECULES WITH Ni(100).** The adsorption and reaction of a variety of organonitrogen compounds on a Ni(100) surface have been examined with temperature-programmed reaction, Auger electron spectroscopy, and infrared spectroscopy. Monomethylamine adsorbs via the nitrogen lone pair of electrons and then undergoes C-N bond scission yielding adsorbed carbon, dihydrogen, and ammonia. Aniline  $\pi$ -bonds to the surface and polymerizes to form a thermally stable poly(aniline) surface film. Pyridine undergoes a temperature-induced orientational transformation. At low temperatures pyri-

dine adsorbs with its ring parallel to the surface. At higher temperatures it appears to form an  $\alpha$ -pyridyl species with an activation barrier of 85 kJ/mol. Methyl groups on 2,6-lutidine sterically hinder this reaction. (Edited author abstract) 55 refs.

Schoofs, Gregory R. (Princeton Univ, Princeton, NJ, USA); Benziger, Jay B. *J Phys Chem* v 92 n 3 Feb 11 1988 p 741-750.

**074743 COMBINED USE OF POTENTIODYNAMIC METHODS AND OF RADIOTRACER MEASUREMENTS IN EXAMINING THE NATURE OF ADSORPTION OF ORGANIC SUBSTANCES ON PLATINUM.** A method for studying the nature of the adsorption products of organic substances on platinum electrodes which is based on simultaneous radiotracer and electrochemical sweep measurements is proposed and tested with model substances (methanol and formaldehyde). The method is such that adsorption can be studied under steady-state conditions, i.e., when adsorbate is present in the solution and when electrochemical processes occur, and that assumptions which cannot be verified experimentally need not be used. In the adsorption of methanol on platinum electrodes, the species were shown to have an average composition of COH (or HCO). (Edited author abstract) 26 refs.

Khazova, O.A. (Acad of Sciences of the USSR, Moscow, USSR); Andreev, V.N.; Vasil'ev, Yu.B.; Kazarinov, V.E. *Sov Electrochem* v 23 n 9 Sep 1987 p 1091-1096.

**074744 FTIR STUDY OF THIONOCARBAMATE ADSORPTION ON SULFIDE MINERALS.** The adsorption of O-isopropyl-N-ethylthionocarbamate (IPETC) and O-isobutyl-N-ethoxycarbonylthionocarbamate (IBECTC) on chalcocite, chalcopyrite and pyrite has been studied in situ by FTIR spectroscopy using the ATR technique. Thionocarbamates adsorb most strongly on chalcocite at pH 4-10, while on chalcopyrite and pyrite, adsorption continues to increase with decreasing pH. Except at very low pH values, adsorption on chalcocite is 3-20 times higher than on chalcopyrite and pyrite. IPETC chemisorbs on chalcocite through sulfur below pH 6 and through both sulfur and oxygen above pH 6. (Edited author abstract) 18 refs.

**074745 HEATS OF SORPTION OF ACRYLONITRILE INTO 6-NYLON FIBRES.** The sorption of acrylonitrile into a 6-nylon fibre at 22°C has been studied by calorimetry. It is shown that with change in the concentration of sorbed acrylonitrile from 0.1-1.0 wt.% the integral heat of sorption falls from 52 to 45 kJ/mole for the initial fibre and from 50 to 35 kJ/mole for the fibre modified by radiation grafting of PAN which points to the presence in the fibres studied, as on the surface of solids, of a quite wide distribution of the site of sorption over the heats of sorption. From comparison of the heats of sorption, the equilibrium concentrations and the coefficients of diffusion into the initial and grafted 6-nylon fibres it is concluded that a loose PAN layer forms on the surface of the grafted fibre. **074746 ELECTROSORPTION ON HETEROGENEOUS SURFACES - A STATISTICAL MECHANICAL TREATMENT.** A statistical mechanical treatment for electrosorption of neutral organic compounds on heterogeneous surfaces is presented. A continuous-solvent model and a discrete-solvent one with and without lateral dipolar interactions are developed and discussed within the frame of lattice statistics and under mean field approximation. The adsorption isotherms obtained on the basis of the uniform distribution of the energy of sites may be considered as generalized Temkin isotherms. (Author abstract) 19 refs.

*Electrochim Acta* v 33 n 5 May 1988 p 647-653.

**074747 THEORETICAL APPROACH TO THE ELECTROSORPTION KINETICS.** The kinetics of the adsorption process of neutral organic compounds on electrodes is studied from a theoretical point of view. Adopting simple kinetic arguments and within the frame of lattice statistical thermodynamics rate equations for electrosorption on homogeneous and random heterogeneous surfaces are developed when diffusion effects are negligible. The case where diffusion predominates is also studied. The Fick diffusion equation under constraints corresponding to an initially clean electrode surface is solved numerically. Adopting various adsorption isotherms, the influence on the electrosorption kinetics of a number of parameters, like the lateral particle-particle interactions, the field-dipole ones, as well as the adsorbent heterogeneity is investigated. (Author abstract) 24 refs.

**074749 ADSORPTION THERMODYNAMICS OF CARBOFURAN ON FLY ASH.** Adsorption of carbofuran on fly ash was studied at 25 and 50°C. The data were analyzed in terms of isotherm, Freundlich equation and various thermodynamic parameters. The data fit in close agreement with the Freundlich equation and yield 'S' type isotherms. The degree of adsorption of carbofuran was determined and found to be in accordance with the partial molar free energies and  $K_d$  values. The thermodynamic constants ( $K_d$ ) and standard free energy ( $\Delta G^\circ$ ), enthalpy ( $\Delta H^\circ$ ) and entropy changes ( $\Delta S^\circ$ ) were calculated for predicting the nature of adsorption. (Author abstract).

**074750 ADSORPTION OF NONIONIC POLYACRYLAMIDE ON SODIUM MONTMORILLONITE: RELATION BETWEEN ADSORPTION,  $\zeta$  POTENTIAL, TURBIDITY, ENTHALPY OF ADSORPTION DATA AND  $^{13}\text{C}$ -NMR IN AQUEOUS SOLUTION.** The adsorption of nonionic polyacrylamide on sodium montmorillonite is studied using different molecular weight macromolecules (mol wt =  $4.40 \times 10^4$ ,  $1.20 \times 10^5$ ,  $3.70 \times 10^5$ ,  $3 \times 10^6$ ), with the monomeric unit represented by the isobutyramide molecule. All of the adsorption runs are completed by turbidimetric, electrokinetic, X-ray scattering, and calorimetric data. The adsorption of isobutyramide reveals the nature of the different adsorption sites (broke edge faces and external basal faces). The  $^{13}\text{C}$ -nuclear magnetic resonance of the C=O groups in the adsorbed phase and in aqueous solution corroborate the conformation variations along the isotherms. It is demonstrated that the broadening is due to a chemical shift dispersion arising from the surface site heterogeneity or the rotational isomerism hindrance accompanying a change of macromolecular structure near the surface. (Edited author abstract). 43 Refs.

Bottero, J.Y. (CNRS, Vandoeuvre, Fr); Bruant, M.; Cases, J.M.; Canet, D.; Fiessinger, F. *J Colloid Interface Sci* v 124 n 2 Aug 1988 p 515-527.

**074751 FOURIER TRANSFORM INFRARED AND RAMAN SPECTRA OF DIMETHYL METHYLPHOSPHONATE ADSORBED ON MONTMORILLONITE.** FTIR and Raman spectroscopic analyses were used to determine the adsorption interaction between the highly polar organophosphonate dimethyl methylphosphonate (DMMP) and a standard montmorillonite clay (SAZ-1). The polar DMMP molecular appears to interact with the interlamellar exchangeable cation in the montmorillonite clay and to displace water from the clay mineral interlamellar spaces. This was confirmed by XRD observation of a primary lattice distance expansion of about 3.3 Å during the adsorption process. Some evidence for a secondary interaction of DMMP with the natural organic matter associated with the clay mineral was obtained. (Author abstract). 24 Refs.

**074752 LANGMUIR-BLODGETT FILMS OF D-NOR-URETHANE-TCNQ AND RELATED MOLECULES.** New molecules of the type D- $\sigma$ -A have been shown to form Pockels-Langmuir monolayers at the air-water interface and Langmuir-Blodgett films over glass or Al substrates (D, one-electron donor;  $\sigma$ , covalent bridge (urethane); A, strong one-electron acceptor BHTCNQ or weak two-electron acceptor HMTCAQ). Assemblies  $M_1$  | D- $\sigma$ -A |  $M_2$  ( $M_1$ ,  $M_2$ , conventional metallic thin films; D, strong one-electron donor; A, strong one-electron acceptor) had been predicted to be one-molecule-thick rectifiers of electrical current. Greasy tails are found to be generally helpful in orienting D- $\sigma$ -A molecules in monolayers (even though they may slow down electron conduction through the molecules). (Edited author abstract) 51 refs.

**074754 MONOLAYER FILMS PREPARED BY THE SPONTANEOUS SELF-ASSEMBLY OF SYMMETRICAL AND UNSYMMETRICAL DIALKYL SULFIDES FROM SOLUTION ONTO GOLD SUBSTRATES: STRUCTURE, PROPERTIES, AND REACTIVITY OF CONSTITUENT FUNCTIONAL GROUPS.** Exposure of evaporated gold films supported on silicon wafers to solutions of dialkyl sulfides or alkanethiols in methanol or ethanol results in rapid formation of a monolayer of the organosulfur compound adsorbed onto the gold. The resulting films have been characterized by using a number of techniques, including X-ray photoelectron spectroscopy, infrared spectroscopy, ellipsometry, and wetting. These self-assembled, supported organic monolayer films are systems that can be used to study problems in the physical-organic chemistry

and materials science of organic surfaces, especially the relation between the molecular-level structure of the film constituents and the macroscopic properties of the assembled monolayers. The films are relatively robust: examples formed from both dialkyl sulfides and alkanethiols withstand washing and prolonged soaking in neutral water, but films containing dialkyl sulfides are destroyed by contact with aqueous base at pH 8-13. (Edited author abstract) 68 refs.

**074755 ORIENTATION OF MOLECULAR MONOLAYERS AT THE LIQUID-LIQUID INTERFACE AS STUDIED BY OPTICAL SECOND HARMONIC GENERATION.** The study of molecular monolayers at the liquid-liquid interface has attracted attention from researchers in a variety of disciplines. Interface-active monolayers are of interest in studying interfacial mass transfer and micellar structure, and as model membrane structures. In this paper we report the use of optical second harmonic generation to determine the orientation of monolayers of sodium 1-dodecylphthalene-4-sulfonate at the aqueous/decane and aqueous/carbon tetrachloride interfaces. The results show that the molecular orientation depends on the nature of the nonaqueous phase. 18 refs.

**Alkylation** See Also DYES AND DYEING—Synthesis.

**074756 ALKYLATION OF PHTHALIMIDE WITH HIGHER ALKYL BROMIDES UNDER CONDITIONS OF PHASE-TRANSFER CATALYSIS.** N-alkylphthalimides, used as intermediates for synthesis of primary amines, are obtained in good yields by heating potassium phthalimide with alkyl halides in dimethylformamide (DMFA) and other polar solvents. Phthalimide is alkylated by higher alkyl bromides, RBr, where R = C<sub>4</sub>H<sub>9</sub>, C<sub>12</sub>H<sub>25</sub>, C<sub>16</sub>H<sub>33</sub>, in toluene (at 95°) in high yields in presence of solid K<sub>2</sub>CO<sub>3</sub> and a phase-transfer catalyst, methyl triethylammonium sulfate. The reaction of phthalimide with dodecyl bromide under the usual conditions of phase-transfer catalysis (organic phase-50% NaOH) is accompanied by hydrolysis of phthalimide and formation of a complex mixture of products, from which N-dodecylphthalimide, dodecylamine, 1-dodecanol, dodecyl ether, and 1-dodecene were isolated. 10 refs.

**074757 ALKYLATION OF p-CRESOL WITH ISOBUTENE CATALYZED BY CATION-EXCHANGE RESINS: A KINETIC STUDY.** In this paper the kinetics of the reactions occurring in the alkylation of p-cresol with isobutene, catalyzed by cation-exchange resins, have been studied. These reactions are the monoalkylation, the successive dialkylation, and the dimerization and trimerization of isobutene. The kinetics have been studied in a slurry reactor, completely mixed and operating under batch conditions for the liquid phase and continuous conditions for the gas phase. The influence of mass transfer on reaction rates has been carefully considered with experiments independent of kinetic runs. Vapor-liquid equilibrium of isobutene, in the reaction mixture, has also been studied for determining the gas-liquid interface concentration of this reagent. A second-order kinetic law has been found suitable to describe the behavior of all mentioned reactions. (Edited author abstract) 16 refs.

**074758 ALKYLATION OF AZOLES USING  $\beta$ -FUNCTIONAL ALKYL HALIDES UNDER CONDITIONS OF PHASE TRANSFER CATALYSIS.** The objective of this study was to develop a convenient synthetic method for direct N-alkylation of pyrazole (I), 3(5)-methylpyrazole (II), 3,5-dimethylpyrazole (III), 1,2,4-triazole (IV), and tetrazole (V) using  $\beta$ -functional alkyl halides under conditions of two-phase catalysis and with high product yields. This investigation was stimulated by the fact that the desired reaction products are intermediates in the synthesis of an important class of compounds, vinylazoles, as well as of various pharmaceutical agents. It is found that depending on the acidity of the azole, alkylation with dichloroethane can be accompanied by  $\beta$ -elimination. The effect of solvent on the course of alkylation reactions using dichloroethane has also been studied, and revealed that the reactions occur via the intermediacy of ion pairs rather than free anions. 21 refs.

**074759 DETERMINATION OF AVIDIN AND BIOTIN BY FLUORESCENCE POLARIZATION.** Assays for avidin and biotin are presented which combine high sensitivity with short assay times. Minimum detectable concentrations are 5 ng/mL avidin and 100 pg/mL biotin and assay time is under 10 min. The fluorescence polarization of a biotin-fluorescein conjugate is monitored. Polarization varies as a function of avidin concentration and, at fixed avidin levels, as a function of competing biotin concentrations. This simple, rapid assay has a detection limit about 1000-fold lower than the commonly used 4-hydroxyazobenzene-2-carboxylic acid dye binding method. (Author abstract) 23 refs.

**074761 CONVERSION OF ORGANIC OXYGEN COMPOUNDS AND THEIR MIXTURES ON H-ZSM-5.** The conversion of a number of alcohols, ethers, ketones, aldehydes, carboxylic acids, esters, and cyclic compounds and their mixtures on H-ZSM-5 at 673 K was investigated. These compounds can be easily converted to aromatic hydrocarbons if the C/H ratio of the molecule fragment, remaining after elimination of oxygen as water, is less than 0.62. At higher C/H ratios, coking of the catalyst increases, thus reducing its lifetime, a difficulty which can be overcome by hydrogenation of these compounds prior to their conversion over H-ZSM-5. A procedure is proposed for converting at least a part of organic waste chemicals to valuable products instead of burning them. (Author abstract) 30 refs.

**074762 EFFECT OF CULTURE HISTORY ON THE DETERMINATION OF BIODEGRADATION KINETICS BY BATCH AND FED-BATCH TECHNIQUES.** A pure bacterial culture was grown in continuous culture at four dilution rates with 2-chlorophenol (2-CP) as the carbon source. During the steady state the Monod kinetic parameters ( $\mu_m$  and  $K_S$ ) characterizing 2-CP biodegradation were determined under batch and fed-batch conditions. The values of both parameters were influenced by the dilution rate: the higher the dilution rate the larger the value of  $\mu_m$  and the smaller the value of  $K_S$ . Parameter values determined under batch conditions were influenced more than those determined under fed-batch conditions. These effects were consistent with the physiological adaptation of cells to their previous growth environment. (Author abstract) 26 refs.

**Biosynthesis** See Also BIOLOGICAL MATERIALS—Chromatographic Analysis.

**074764 ENZYMATIC SYNTHESIS OF L-CYSTEINE.** For L-cysteine production, the authors chose a reaction catalyzed by O-acetylserine sulphydrase (OASS). An enzymatic process to synthesize L-serine from glycine and formaldehyde has recently been described. L-O-Acetylserine (OAS) can be produced in high yield by reacting L-serine with acetic anhydride under acidic conditions. The second substrate, sulfide, is widely available. Therefore, the availability and cost of the substrates, which are normally the limiting factors for the successful development of enzymatic production processes, are under control. However, OAS was known to be readily isomerized to N-acetylserine (NAS) at alkaline pH. This article reports on the study of the OASS reaction and the development of an automatic feeding system to control the addition of substrates that gives a high concentration of L-cysteine with a good yield. 18 refs.

**074768 HAZARDOUS ORGANIC COMPOUND ANALYSIS.** The assessment of the source, extent, and nature of hazardous-waste contamination relies on sophisticated chemical analyses to identify and quantify a wide range of pollutants. For organic compounds, these analyses are most often performed using combined gas chromatography/mass spectroscopy (GC/MS). In an effort to obtain high-quality chemical data on a national scale, regulatory agencies have developed standardized methods for sample handling and preparation as well as standardized instrument-operating conditions. Elaborate quality assurance and quality control (QA/QC) procedures specify and require the use of field blanks, laboratory blanks, surrogate spikes, matrix spikes, duplicate samples, and internal standards to assure that performance standards are met (quality control). In addition, comprehensive documentation and scientific review are required. This article discusses fundamentals of analysis, analysis problems, quantitation, and other aspects of the subject. 9 refs.

**074770 INTERCOMPARISON STUDY OF LIQUID-LIQUID EXTRACTION AND ADSORPTION ON POLYURETHANE AND AMBERLITE XAD-2 FOR THE ANALYSIS OF HYDROCARBONS, POLYCHLOROBIPHENYLS, AND FATTY ACIDS DISSOLVED IN SEAWATER.** The application of these methods sampling in parallel the same body of water has resulted in significant differences related to the proportion of higher molecular weight components in the complex mixtures of aliphatic and aromatic hydrocarbons. These

occur irrespective of the operating conditions and are attributed to selective interactions of these hydrophobic species with macromolecular organic matter such as fulvic and humic acids and to the resulting effects on adsorbent properties. In contrast, the quantitative results for most hydrocarbons and fatty acids depend on the total sampled volume, resulting in major losses when volumes larger than 300-400 L are collected with the adsorption systems (3000 bed volumes for the Amberlite XAD-2. Additional study results are discussed. (Edited author abstract) 65 refs.

Gomez-Belinchon, Josep I. (CSIC, Barcelona, Spain); Grimalt, Joan O.; Albaiges, Joan. *Environ Sci Technol* v 22 n 6 Jun 1988 p 677-685.

**074771 EVALUATION OF METHOD 25 NONMETHANE ORGANIC ANALYZER DESIGN.** Under contract to the U.S. Environmental Protection Agency, Research Triangle Institute has been conducting research to improve the precision, accuracy and limit of detection attainable with the EPA Method 25 nonmethane organic (NMO) analyzer. In Method 25, volatile organic carbon (VOC) samples are collected by drawing gas from an emitting source through a dry ice cooled sample trap and into an evacuated collection tank. The hydrocarbon concentration emitted from the source is determined on a per-carbon basis by catalytically converting the trap and tank sample fractions to CO<sub>2</sub> and quantitating the amount of CO<sub>2</sub> produced using the NMO analyzer. A reduction catalyst evaluation led to the selection of an NMO analyzer reduction catalyst which operates at a moderate temperature and displays no appreciable effect on peak shape. A gas chromatographic column system which provides better permanent gas separation and hydrocarbon quantitation was also selected for use in the NMO analyzer. (Author abstract) 3 Refs.

**074776 EFFECT OF ELECTROLYTE CONCENTRATION ON THE INTERACTION OF HUMIC ACID AND HUMATE WITH MONTMORILLONITE.** The present study examines the dependence of the interaction of montmorillonite with a brown-coal humic acid on the pH and electrolyte concentration. The effects of these two factors were studied separately. The interaction was always measured by decrease of concentration of humic substances in the solution. The adsorption isotherms of humic acid on H-montmorillonite and of Na-humate on Na-montmorillonite were measured, and results based on electrolyte and pH variations are given. To interpret these effects, the surface charge, potential and the interaction energy of montmorillonite and humic substances were calculated on the basis of a simple model concerning two, mostly different, intrinsic dissociation constants. As a result of these calculations, it is most likely that joint coagulation, i.e., coaggregation, of the components takes place. (Edited author abstract) 40 refs.

**074777 AIR-WATER PARTITIONING COEFFICIENTS OF ORGANICS IN DILUTE AQUEOUS SOLUTIONS.** Henry's Law constants were measured for 45 chemicals spanning a wide range of chemical structures and volatilities. A static headspace method, Equilibrium Partitioning in Closed Systems (EPICS), was used to measure Henry's Law constant, and the batch air stripping method was used as a check. Measurements were conducted over a temperature range of 10-30°C, and the data were correlated with a temperature regression equation. An average precision of 10% was obtained for the EPICS runs, and the Henry's constants agreed well with the batch air stripping results and other reported values. (Author abstract) 14 refs.

**074778 PRODUCTION OF TOXIC EQUIVALENTS TO 2, 3, 7, 8-TCDD IN MUNICIPAL-WASTE INCINERATORS (MWIS).** We have modified the model of W.M. Shaub and W. Tsang to calculate dioxin formation from precursors in the gas phase and on fly ash,

by estimating congener-specific parameters from measurements of dioxin production over 2 h time periods on fly ash performed by H. Vogt et al. The resulting kinetic data have been combined with a previously determined temperature-time history in a municipal waste incinerator (MWI) and with relative EPA toxicity estimates to determine toxic equivalents to 2,3,7,8-TCDD obtained in a representative MWI. If toxic inputs producing precursors were measured, together with the toxic equivalents of the outputs, then our model could be used to define furnace destruction factors for the inputs. (Edited author abstract) 9 refs.

Li, C.P. (Univ of California, La Jolla, CA, USA); Wiesenbahn, F.; Penner, S.S. *Energy (Oxford)* v 13 n 3 Mar 1988 p 217-223.

**074779 SIMPLIFIED MODEL FOR DIOXIN AND FURAN FORMATION IN MUNICIPAL-WASTE INCINERATORS.** The authors have used the temperature-time profile derived from a one-dimensional energy-balance model, in conjunction with the kinetic estimates of W.M. Shaub and W. Tsang, to estimate the production of dioxins from chlorinated precursors in the gas phase and on fly ash. In agreement with earlier studies, it is found that dioxin production on particulates is much larger than gas-phase formation. The scaling relation for dioxin production on fly ash shows that the absorbed concentration in ng/g is proportional to the square of the gas-phase precursor concentration and inversely proportional to the particulate radius. Calculated dioxin outputs for flue-gas-fly-ash mixtures and for bottom ash fall in the general range observed for some of the available municipal-waste incinerator data. Modifications needed in the model parameters are suggested to obtain agreement with the best of the new incinerators. Additional study results are discussed. (Edited author abstract) 28 refs.

**074780 SOLID-STATE REACTION BETWEEN p-PHENYLENEDIAMINE AND p-BENZOQUINONE.** p-Phenylenediamine reacts with p-benzoquinone in solution as well as in the solid state forming a 1:1 molecular complex which may be polymeric or agglomeric in nature. When the two components are mixed in the solid state in an agate mortar first a blue color develops which ultimately (after a few minutes) changes to dark brown. Differential scanning calorimetric studies show that the reaction products obtained from solution and by solid-state reactions are the same. Spectroscopic studies reveal that charge transfer stabilized by hydrogen bonding is involved in the formation of the complex. UV and visible spectroscopic studies in solution show that the complex either is unstable in solution or requires some time for stabilization. Magnetic measurements and ESR spectroscopy show the presence of an unpaired electron in the complex. (Author abstract) 25 refs.

**074781 INTERACTION OF XENOBIOTICS WITH MERCURY-ADSORBED PHOSPHOLIPID MONOLAYERS.** This study examines the following groups of toxic compounds: polycyclic aromatic hydrocarbons (PAH), DDT and other chlorinated pesticides, and the phenothiazines. The effect of these substances on the monolayer is measured by monitoring the capacitance-potential curves of the adsorbed phospholipid. The response to these compounds is manifested as a change in the potential and height of two capacitance peaks. PAH penetrate the film without disrupting its fundamental structure. The extent of interaction is dependent on the hydrophobicity and aromaticity of the PAH. DDT interacts with the layer depressing the capacitance peaks. The heterocyclic 3-ringed phenothiazines also affect the membrane; the response depends on the N- and ring substituents on these compounds. (Edited author abstract) 10 refs.

## Chemical Vapor Deposition

**074782 CONSTRUCTION OF AN ADIABATIC CALORIMETER FOR A VAPOR-DEPOSITED SAMPLE AND THERMAL CHARACTERIZATION OF AMORPHOUS BUTYRONITRILE.** An adiabatic calorimeter for a vapor-deposited sample was newly constructed, and thermal properties of amorphous butyronitrile were studied in detail. The cryostat was cooled down to 10 K with a built-in refrigerator. The sample vapor was introduced through a filling tube into a calorimeter cell. A special device was made in order to minimize the heat flow from the tube to the cell. Butyronitrile vapor was deposited at 67 and 40 K in the first and the second experiments, respectively. Another kind of vitreous sample was prepared by rapidly cooling the liquid in comparison with the vapor-deposited vitreous samples. Heat capacities of the samples were measured in the temperature range from 15 to 175 K with an imprecision of about  $\pm 0.5\%$ . Both the vapor-deposited and the liquid-quenched samples exhibited heat capacity jump characteristic of the glass transition of the same temperature, viz. 97 K. (Edited author abstract) 20 refs.

**074783 REVERSED-PHASE HIGH-PERFORMANCE LIQUID CHROMATOGRAPHY OF SUBSTITUTED ANILINES UTILIZING MOLECULAR-RECOGNIZING ABILITY OF CROWN ETHER: COMPARISON WITH ION-PAIR CHROMATOGRAPHY.** Host-guest interaction between crown ether and protonated amino group has been applied to the specific separation of positional isomers of mono- and disubstituted anilines by reversed-phase high-performance liquid chromatography with mobile phase containing 18-crown-6. The retention of these amines on a hydrophobic stationary ligand was enhanced by association with 18-crown-6, and the degree of the enhancement reflected the molecular structure of the guest. (Edited author abstract) 22 refs.

**074784 DIRECT LIQUID CHROMATOGRAPHIC SEPARATION OF RACEMATES WITH AN  $\alpha$ -CYCLODEXTRIN BONDED PHASE.** To date there have been no reports on the resolution of any enantiomers on  $\alpha$ -cyclodextrin bonded liquid chromatography phases. In this work 22 compounds, including racemic tryptophan, phenylalanine, tyrosine, and analogues are quickly separated with aqueous or hydroorganic mobile phases. The  $\alpha$ -cyclodextrin bonded phase linkage is hydrolytically stable and completely analogous to that of the successful  $\beta$ -cyclodextrin bonded phase. The retention behavior and

the effect of structure on chiral recognition are discussed. None of the compounds reported in this work can be resolved easily with the  $\beta$ -cyclodextrin bonded phase. (Edited author abstract) 27 refs.

**074785 INFRARED EMISSION FROM A FLAME AS THE BASIS FOR CHROMATOGRAPHIC DETECTION OF ORGANIC COMPOUNDS.** The feasibility of using infrared emission from a combustion flame as a means of detection for chromatography was investigated. Over the wavelength interval from 1 to 5  $\mu$ m, two strong emission bands were observed with a PbSe detector when organic compounds were introduced into an hydrogen/air flame. The band at 4.3  $\mu$ m ( $2326\text{ cm}^{-1}$ ) was due to the asymmetric stretch of carbon dioxide while the band at 2.7  $\mu$ m was due to both water and carbon dioxide emission. The carbon dioxide emission at 4.3  $\mu$ m was found to be most intense at the tip of the flame and to increase with the amount of organic compound introduced into the flame. (Edited author abstract) 16 refs.

**074786 APPLICATION OF FAST LC TO PHARMACEUTICAL ANALYSIS: DOPAMINE · HCl.** A reversed-phase HPLC method for the determination of the dopamine hydrochloride content of pharmaceutical intravenous solutions is developed using short (3-cm) columns packed with 3- $\mu$ m particles. Total analysis time for the stability indicating assay, which is capable of separating the analyte from all its common degradates and formulation matrix components, is 2 min. The assay is equivalent in performance (accuracy, precision, separation behavior, ruggedness) to a standard method recommended by the United States Pharmacopeia (USP). Common components of conventional HPLC systems are evaluated with respect to their utility for this application of fast LC. (Author abstract) 12 refs.

Brown, David S. (Travenol Lab Inc, Morton Grove, IL, USA); Jenke, Dennis R. *J Chromatogr Sci* v 25 n 11 Nov 1987 p 494-500.

**074787 DETERMINATION OF OXALATE IN PHARMACEUTICAL MATRICES BY INDIRECT PHOTOMETRIC CHROMATOGRAPHY.** An indirect photometric ion chromatography method is developed for the quantitation of oxalate in typical pharmaceutical matrices. The column/mobile phase conditions used represent a trade off between resolving power and sensitivity and results in an assay with a total analysis time of less than 9 minutes. Method response is linear between concentrations of 10 to 80 ppm oxalate. The limit of quantitation is roughly 5 ppm. Precision in the range of 30 to 80 ppm is better than 1.0% RSD of replicate injections, and the accuracy in a variety of matrices is  $100 \pm 2\%$ . The method is quite rugged and meets rigorous suitability requirements even after 500 injections. (Edited author abstract) 11 refs.

Downey, Brian P. (Travenol Lab Inc, Morton Grove, IL, USA); Jenke, Dennis R. *J Chromatogr Sci* v 25 n 11 Nov 1987 p 519-527.

**074788 REVERSED-PHASE LIQUID CHROMATOGRAPHY WITH MIXED ELUENTS: PARTITION MODEL OF RETENTION FOR IONOGENIC SOLUTES.** Based on the pure partition model of solute retention new theoretical equations for ionogenic solutes are discussed. These equations define dependence of the capacity ratio on the mobile phase composition, which is characteristic for the reversed-phase liquid chromatography. The treatment presented in this paper facilitates the description of solute dissociation effects in the RPLC with mixed eluents and forms a background for further studies in this field. 21 refs.

**074792 MICELLAR LIQUID CHROMATOGRAPHY OF ADENOSINE IN CACAO.** A rapid isocratic micellar HPLC procedure for the separation of adenosine from theobromine in cacao was developed. The adenosine peak was identified by using the enzymatic peak shift technique with adenosine deaminase (ADA). Separation was performed on a polyvinyl alcohol (PVA) column using a mobile phase containing 0.012 M sodium dodecyl sulfate (SDS) and 0.005 M phosphate buffer (pH 11.5). Quantitation and detection limits were determined. In addition the separations obtained on a PVA column with the micellar mobile phase were compared to separations obtained on a C<sub>18</sub> column using both isocratic and gradient elution. (Author abstract) 18 refs.

**074795 LIQUID CHROMATOGRAPHY-PHOTOLYSIS-ELECTROCHEMICAL DETECTION FOR ORGANOIODIDES. 1. OPTIMIZATION AND APPLICATION.** An improved high-performance liquid chromatographic detection method has been applied for the trace determination of iodinated organic compounds. The method, which incorporates postcolumn, on-line UV irradiation prior to oxidative electrochemical (EC) detection, exploits the facile photochemical dissociation of the C-I bond to form anionic iodide and a number of solvolyzed products. Following bond cleavage, iodide is readily detected amperometrically at moderate oxidative potentials, allowing for the determination of a number of organoiodides at the 25-75 pg level. (Edited author abstract) 30 refs.

**074799 CHROMATO-MASS SPECTROMETRY OF HEAVY PYRIDINE BASES.** Crude heavy pyridine bases (CHPB) constitute a complex mixture of heterocyclic nitrogen-containing compounds, isolated from coal tar fractions. The data presented in the literature on the composition of heavy pyridine bases from coal are very limited. For analysis of the CHPB we used a Finnigan-4021 chromat-mass spectrometer equipped with a computer. The separation of the bases was carried out on a quartz capillary column with OV-101. The carrier gas was hydrogen. The results of quantitative analysis of the CHPB showed that the proportion of the basic components (quinoline, isoquinoline, quinaldine, and lepidine) was about 60%. In addition, the CHPB contain more than 10 components with a concentration of over 1%. Thus over 70 components were found in the CHPB, most of which were identified. 20 refs.

**074800 LIGAND EXCHANGE CHROMATOGRAPHY SEPARATIONS OF SOME PHENOLIC COMPOUNDS ON ZINC SILICATE IN Fe(III) FORM.** The high sorption capacity of zinc silicate for Fe(III) has been utilized for the separation of phenolic compounds on the basis of ligand exchange. The coordination of ligands with the central metal ion occurs through oxygen. Ligand sorption capacity, rate of sorption and break-through capacity have been studied. The distribution coefficients ( $K_d$  values) of 21 phenols have been determined in five different systems. Selectivity has been determined on the basis of  $K_d$  values of these phenols. On the basis of differences in  $K_d$  values various analytically important quantitative binary and ternary separations on columns of zinc silicate in Fe(III) form have been achieved. (Author abstract) 12 refs.

**074809 LARGE SCALE PURIFICATION OF APOCAROTENOIDS FROM COCHLOSPERMUM TINCTORIUM BY COUNTER-CURRENT CHROMATOGRAPHY.** Carotenoids are well-known for their instability so usual analytical methods such as HPLC or preparative TLC applied to the separation of the constituents of *Cochlospermum tinctorium* failed in the isolation of pure pigments for further chemical characterization. Thus high-speed CCC using a horizontal flow-through coil planet centrifuge was used to conveniently and efficiently achieve this separation for quantities up to 500mg of the crude plant extract. (Author abstract) 5 refs.

Diallo, B. (Inst de Pharmacie, Brussels, Belg); Vanhaelen, M. *J Liq Chromatogr* v 11 n 1 Jan 1988 p 227-231.

**074810 SEPARATION OF FLAVONOIDS IN CRUDE EXTRACT FROM SEA BUCKTHORN BY COUNTERCURRENT CHROMATOGRAPHY WITH TWO TYPES OF COIL PLANET CENTRIFUGE.** Flavonoid constituents in a crude ethanol extract from dried fruits of sea buckthorn (*Hippophae rhamnoides*) were subjected to countercurrent chromatography with a two-phase solvent system. Separations were performed with two different types of the coil planet centrifuge: one is called the multilayer coil planet centrifuge and the other, the horizontal flow-through coil planet centrifuge. Although the horizontal flow-through coil

planet centrifuge produced efficient peak resolution for five flavonoid components, the multilayer coil planet centrifuge yielded much superior results in terms of partition efficiency, separation time and sample loading capacity. (Edited author abstract) 10 refs.

**074811 ANALYSIS OF FLAVONOIDS BY HPLC: AN UPDATE.** The innovative technological developments in HPLC use in recent years has provided the researcher with extremely rapid procedures for the qualitative and quantitative analysis of flavonoids. The current sensitivity of this technique allows for the use of extremely small amounts of material—nanogram or picogram quantities that can easily be used. The initial cost of HPLC instrumentation is still high, but small-scale, solid-phase extraction clean-up techniques coupled with inexpensive guard columns have extended the life of expensive analytical columns. As it becomes practical to resolve the more complex phenolic mixtures in plants by various combinations of these rapid, sensitive methods, HPLC may become the technique of choice for flavonoid analysis. 123 refs.

**074812 LIQUID CHROMATOGRAPHIC-ELECTROCHEMICAL TECHNIQUE FOR DETERMINATION OF ETHYLENETHIOREA RESIDUES.** A high performance liquid chromatographic-electrochemical (HPLC-EC) technique was developed to selectively determine ethylenethioarea (ETU) at residue levels without derivatization. ETU was eluted from a C-8 column with water, a phosphoric acid electrolyte solution was added to the column eluate, and the ETU was detected with an electrochemical detector containing a Au/Hg working electrode. The HPLC-EC system produced a sharp chromatographic peak for ETU that was detected by the Au/Hg electrode at an applied potential of  $\pm 36$  v. (Edited author abstract) 22 refs.

**074813 DETERMINATION OF POLYCYCLIC AROMATIC COMPOUNDS BY HIGH-PERFORMANCE LIQUID CHROMATOGRAPHY WITH SIMULTANEOUS MASS SPECTROMETRY AND ULTRAVIOLET DIODE ARRAY DETECTION.** A major problem in the determination of polycyclic aromatic compounds (PACs) in environmental samples is the extreme complexity of the extracts, even after extensive fractionation. The combination of high-performance liquid chromatography (HPLC) with simultaneous mass spectrometry (MS) and ultraviolet diode array detection (DAD) is a powerful tool for the identification and quantitation of such species with a high degree of confidence. HPLC allows the selective separation of a wide variety of PACs, including thermally labile and high molecular weight compounds. Electron ionization MS with the moving belt interface provides high sensitivity and selectivity, as well as structural information such as molecular weight, functional groups, and elemental composition. (Edited author abstract) 17 refs.

**074814 ENHANCED FLUORESCENCE DETECTION OF DANSYL DERIVATIVES OF PHENOLIC COMPOUNDS USING A POSTCOLUMN PHOTO-CHEMICAL REACTOR AND APPLICATION TO CHLOROPHENOLS IN RIVER WATER.** Photochemical decomposition by ultraviolet (UV) irradiation of dansyl derivatives of phenolic compounds in methanol-water mixtures leads to the formation of highly fluorescent dansyl-OH and dansyl-OCH<sub>3</sub>. With substituted phenols as model compounds, it is demonstrated

that inductive effects, caused by the substituents, play a major role in the gain in fluorescence signal (up to 8000-fold) that is obtained after postcolumn UV irradiation of the dansyl derivative, compared to that of the nonirradiated derivative. The optimal irradiation time for the dansyl derivatives is about 5.5 s. (Edited author abstract) 23 refs.

**074815 GLASS CAPILLARY GAS CHROMATOGRAPHY-MASS SPECTROMETRY AT HIGH TEMPERATURES. DIRECT ANALYSIS OF FREE BASE PORPHYRINS AND METAL PORPHYRIN COMPLEXES EXTRACTED FROM THE SERPANO OIL SHALE.** This study describes GC/MS analysis of natural petroporphyrin extracts containing alkylporphyrins either as vanadyl complexes or as demetallated free bases. The combination of high temperature glass capillary gas chromatography with mass spectrometry allows, for the first time, direct determination of electron impact mass spectra of separated alkylporphyrins, making additional purification and derivatization unnecessary. The authors also give detailed working directions for the preparation of the high temperature GC/MS-interface, and of the high temperature stable OV-225-OH columns (max. working temperature 390°C). (Edited author abstract) 37 refs.

**074816 SELECTIVE DETERMINATION OF OXYGENATES IN COMPLEX SAMPLES WITH THE O-FID ANALYZER.** A gas-chromatographic analyzer allowing the selective detection of individual oxygenates in complex organic mixtures, such as gasolines, is described. The analyzer is based on the oxygen-specific response flame ionization detection (O-FID) method. The system operates with capillary columns and includes a cracking reactor to convert any oxygenate to carbon monoxide and a special FID equipped with a microreactor for the catalytic hydrogenation of CO and detection as methane. Hydrocarbons give no signal. The selectivity of the method is better than  $1:10^7$  and the linear range approaches  $10^5$ . (Edited author abstract) 9 refs.

**074817 OXYGEN-SELECTIVE MICROWAVE-INDUCED PLASMA GAS CHROMATOGRAPHY DETECTOR FOR PETROLEUM-RELATED SAMPLES.** An atmospheric-pressure, microwave-induced, helium plasma system for oxygen-selective gas-chromatographic detection of petroleum-related samples is presented. Using the various precautions outlined, the authors report that the oxygen-to-carbon selectivity is  $10^3$ . This is the best oxygen selectivity reported in the literature to date for a microwave-induced plasma detector system. The system is sensitive down to 2 ppm<sub>w</sub> (parts per million by weight) oxygen for narrow-boiling range distillates and simple mixtures and 500 ppm<sub>w</sub> oxygen for wide-boiling range, complex samples. (Edited author abstract) 21 refs.

**074818 HYDROPHOBIC SELECTIVITY IN MICELLAR AND HYDRO-ORGANIC REVERSED-PHASE LIQUID CHROMATOGRAPHY.** Selectivity for homologous series in reversed-phase liquid chromatography (RPLC) using micelles and organic solvents as the modifiers for the aqueous mobile phase was studied. Significant differences were observed between micellar and hydro-organic RPLC systems. With hydro-organic mobile phases, methylene group(s) selectivity depends only on the eluant composition for a given stationary phase chain

length. For micellar eluants, however, the selectivity for homologous series is a function of the solute type. (Edited author abstract) 34 refs.

**074819 HIGH PERFORMANCE LIQUID CHROMATOGRAPHIC DETERMINATION OF (-)-N-FORMYLNOREPHEDRINE IN PLASMA.** An HPLC procedure for the detection and quantitative estimation of (-)-N-formylnorephedrine in rabbit plasma has been developed. The procedure involved the extraction of (-)-N-formylnorephedrine from plasma spiked with the internal standard (phenacetin), using ethyl acetate. The ethyl acetate extract is evaporated under nitrogen and the residue is reconstituted in water and injected onto the column. A u-Bondapak-C18 column 30 cm  $\times$  3.9 mm ID was used. The procedure allows the measurement of (-)-formylnorephedrine in concentrations as low as 150 ng/ml of plasma with total procedure time of about 10 min. The applicability of the procedure to pharmacokinetic studies is illustrated and metabolites are shown not to interfere with the assay procedure. (Edited author abstract) 5 refs.

**074825 PENTACHLORODIBENZO-p-DIOXIN ISOMER DIFFERENTIATION BY CAPILLARY GAS CHROMATOGRAPHY FOURIER TRANSFORM INFRARED SPECTROSCOPY.** Reference infrared vapor-phase spectra of the 14 pentachlorodibenzo-p-dioxin (PnCDD) isomers were recorded at low microgram concentrations. A unique infrared spectrum corresponding to each chromatographically separated or spectrally subtracted mixture component was observed. The structures for individual isomers in each isomer pair were assigned by qualitative valence-bond evaluations and empirically derived quantitative estimations of ether linkage asymmetric stretching frequencies [ $\nu_{\text{COC(asy)}}$ ]. Correlations between calculated linkage (C-O-C) bond angles and  $\nu_{\text{COC(asy)}}$  indicate existence of buttressed 1,6 and 1,9 nonbonded interactions not observed in tetrachlorodibenzo-p-dioxin (TCDD) isomers. (Author abstract) 21 refs.

**074830 SYNCHRONIZED TEMPERATURE/DENSITY PROGRAMMING IN CAPILLARY SUPERCRITICAL FLUID CHROMATOGRAPHY.** The theoretical and practical implications of simultaneous temperature/pressure and synchronized density/temperature programming are considered. Examples are shown for separations of dimethylpolysiloxanes where these tech-

niques provide superior separation over their analogous isothermal programming methods. From the theoretical considerations presented in this paper, it is evident that density, pressure and temperature influence separations performed by capillary SFC. The route by which these parameters effect the chromatographic process is through modulation of the diffusion properties of the mobile phase as expressed by the binary diffusion coefficient,  $D_m$ , terms of the Golay equation. 12 refs.

## Coagulation

**074833 HETEROGENEOUS COAGULATION OF ORGANIC COLLOID AND POWDERED ACTIVATED CARBON.** For the treatment of wastewaters containing both dissolved and suspended organics, powdered activated carbon may well be applied to remove dissolved organics by adsorption, and suspended solid organics by heterogeneous coagulation, at the same time. The condition for this heterogeneous coagulation was studied here. First, control of surface charge of activated carbon by heat treatment was examined. It was found that it is possible to shift the surface charge of the powdered activated carbon in a positive direction. Secondly, heterogeneous coagulation of organic colloid by heat-treated carbon or carbon black was attempted. Coagulation was found to be successful. Stoichiometry of the coagulation was well explained by charge neutralization using surface charge density determined by colloid titration. (Author abstract) 6 refs.

**074835 THERMAL CONVERSIONS OF  $\alpha$ -PROPYLENE CHLOROHYDRIN.** The purpose of the authors' work was to determine the principal relationships of thermal decomposition of anhydrous PCH in the liquid phase. Preliminary experiments showed that appreciable decomposition of PCH begins only at 130°. Therefore thermal conversions of PCH were studied at higher temperatures than in the case of ethylene chlorohydrin in the range 140-170°. It is shown that acetone, 1-(1-chloroisopropoxy)-2-propanol, 2-chloro-1-propanol, hydrogen chloride, and 1,2-dichloropropane are formed during liquid-phase thermal decomposition of 1-chloro-2-propanol in the temperature range 140-170°. Isomerization of 1-chloro-2-propanol to 2-chloro-1-propanol is accelerated by the hydrogen chloride formed during its thermal decomposition. 10 refs.

Silver Spring, MD, USA). *Combust Flame* v 70 n 3 Dec 1987 p 343-347.

**074838 PHOTODECOMPOSITION OF N-ARYL N',N'-DIMETHYLUREA IN AQUEOUS SOLUTIONS.** The photodecomposition process of N-aryl-N',N'-dimethylurea was investigated in aqueous solutions in the presence of oxidizing and reducing additives. Quantum yields of photodecomposition of herbicides were found, and it was shown that monuron undergoes photoreduction more easily; the herbicide diuron is most easily oxidized. (Author abstract) 6 refs.

Svezhentsova, A.A.; Krasnova, V.A.; Vysotskaya, N.A. *Sov Prog Chem* v 53 n 2 1987 p 103-106.

**074839 PHOTODEGRADATION OF TRICHLOROETHYLENE IN MICROHETEROGENEOUS AQUEOUS SYSTEMS.** Hydrogen generated in situ from a water-splitting process was used to reduce trichloroethylene (TCE) to ethane in water. Two hundred and eighty-five  $\mu$ mol of TCE were reduced to less than 8.96  $\mu$ mol within 12 hours of irradiation in a platinum catalyzed water-photolysis system. Zinc was added to the system to enhance the degradation rate. The degradation of 285  $\mu$ mol TCE was completed within 2 and 5 hours with 2 and 1 g. of zinc added, respectively. The hydrogen molecule is not an effective reactive reagent for the degradation of TCE. By the addition of a catalyst such as platinum particle, the hydrogen molecule may be transformed into active hydrogen atoms or the metal bonded hydride form. The hydrogen atoms are then able to reduce TCE to hydrocarbons. (Author abstract) 15 refs.

**074842 THERMAL DECOMPOSITION OF ENERGETIC MATERIALS 27. SYNTHESIS, CHARACTERIZATION, AND THERMOLYSIS OF Cu(II)-DOPED 'BLUE RDX'.** A Cu(II) complex was incorporated in RDX with copper at about the 400 ppm level giving distinctly blue crystals of RDX. Despite exhaustive attempts to determine the identity of the Cu(II)

species, we were able to conclude only that RDX or an RDX fragment is present in the coordination sphere of the metal. By DSC copper-doped RDX exhibits a small exotherm at 175°C which is below the decomposition temperature of pure RDX. By using high-rate thermolysis and rapid-scan FTIR spectroscopy we found that copper-doped RDX liberates more N<sub>2</sub>O and CH<sub>2</sub>O and less NO<sub>2</sub> than does pure RDX suggesting that, consistent with the DSC data, the extent of condensed phase chemistry is enhanced when the lattice is doped with this Cu(II) species. (Author abstract) 18 refs.

**074843 DECOMPOSITION OF 1-PHENYLETHYL HYDROPEROXIDE BY METHYL(PYRIDINE)-BIS(DIMETHYLGLYOXIMATE)-COBALT(III).** The decomposition of 1-phenylethyl hydroperoxide (HROOH) catalyzed by methylcobaloxime (Co(III)) at 70°C has been investigated in oxygen-free chlorobenzene-acetonitrile solvent. A simple mechanism has been suggested which describes the kinetics of the overall reaction and explains (i) the linear dependence of the maximal decomposition rate of the hydroperoxide on the initial substrate concentration, (ii) the relation between  $d[\text{Co(III)}]/dt$  and  $[\text{HROOH}]_0$ , as well as between  $(d[\text{HROOH}]/dt)_{\text{max}}$  and  $[\text{Co(III)}]_0$ , observed experimentally. Deactivation of the catalytically active species takes place with participation of the hydroperoxide. (Edited author abstract) 11 refs.

**074844 THERMAL DECOMPOSITION OF CYCLOHEXANE AT APPROXIMATELY 810°C.** In order to determine the behavior of cycloparaffins in steam cracking reactions, a study of the thermal decomposition of cyclohexane in the presence of n-decane has been carried out at ca. 810°C by using the technique of plug flow reactor. Cyclohexane chiefly decomposes into ethylene, hydrogen, 1,3-butadiene, and small amounts of cyclohexene. We propose a primary mechanism of the decomposition of cyclohexane initiated by n-decane. This mechanism leads to three main primary stoichiometries which account for the whole range of reaction products. (Author abstract) 45 refs.

**074845 'REAL' SINGLE CRYSTALS OF THE ORGANIC CONDUCTOR (FLUORANTHENE)<sub>2</sub> PF<sub>6</sub>: AN N.M.R. STUDY.** A report is presented on extensive n.m.r. investigations of the quasi-one-dimensional organic conductor (fluoranthene)<sub>2</sub>PF<sub>6</sub>. N.m.r. signatures of sample aging and decomposition were established. The authors analyzed the frequency dependence of proton spin-lattice relaxation of individual, well-characterized single crystals. These data could be described quantitatively based on parameters that were independently derived earlier. It is concluded that the intrinsic anisotropy of the conduction electron scattering times  $\tau_{1\parallel}/\tau_{1\perp}$  for (fluoranthene)<sub>2</sub>PF<sub>6</sub> must be larger than  $3 \times 10^4$ , i.e., more than one order of magnitude larger than for TTF-TCNQ and its derivatives. (Edited author abstract) 19 Refs.

Sachs, Gunter (Univ Bayreuth, Bayreuth, West Ger); Dormann, Elmar. *Synth Met* v 25 n 2 Aug 1988 p 157-170.

**074846 KINETICS OF DECOMPOSITION OF HCHO, HCOOH, CH<sub>3</sub>OH, AND N<sub>2</sub>H<sub>4</sub> ON Pt AND Rh SURFACES.** The decomposition kinetics of formaldehyde, formic acid, methanol, and hydrazine on polycrystalline Pt and Rh wires are examined and compared in a differential flow reactor for reactant pressures between

0.02 and 1.0 Torr and temperatures between 400 and 1800 K. HCHO decomposes mostly to CO and H<sub>2</sub> with less than 2% CH<sub>4</sub> formed. Formic acid decomposes CO, CO<sub>2</sub>, H<sub>2</sub>, and H<sub>2</sub>O with identical rates of CO and CO<sub>2</sub> formation on both metals. Methanol decomposes primarily to CO and H<sub>2</sub> although a few percent of HCHO and traces of CH<sub>4</sub> and H<sub>2</sub>O are also formed. Hydrazine decomposes to N<sub>2</sub>, NH<sub>3</sub>, and H<sub>2</sub>. Below 800 K rates of nitrogen and ammonia formation are comparable, while nitrogen predominates above 800 K. It is shown that all rates of formation can be fit quantitatively with simple Langmuir-Hinshelwood (LH) unimolecular rate expressions with an accuracy of  $\pm 30\%$ . These reactions are compared with decomposition of NO, N<sub>2</sub>O, NO<sub>2</sub>, and NH<sub>3</sub>, which were reported previously. (Edited author abstract) 32 refs.

**074847 DECOMPOSITION OF METHANOL, ACETALDEHYDE, AND ACETONE ON SUPPORTED RHODIUM CATALYSTS.** The decomposition processes for methanol, acetaldehyde, and acetone over supported rhodium catalytic films have been investigated by infrared spectroscopy. An interesting support effect was observed for methanol decomposition with methane being the primary product over Rh/TiO<sub>2</sub> and dimethyl ether being formed over Rh/Al<sub>2</sub>O<sub>3</sub>. In the latter case the Al<sub>2</sub>O<sub>3</sub> support was the active catalyst. For acetaldehyde decomposition the principal products were methane and acetone for both supported rhodium catalysts. Acetone decomposition produced only inactive carbon with no other infrared-detectable surface species. It is possible that a metallic rhodium gem-dicarbonyl adsorbate was produced during the decomposition of acetaldehyde over Rh/Al<sub>2</sub>O<sub>3</sub>. Previous observations of the rhodium gem-dicarbonyl species have referred to dispersed Rh<sup>+</sup> ions. (Author abstract) 22 refs.

**074851 CATALYTIC DEHYDROGENATION OF CYCLOHEXENE ON SILICA OVERLAYER FILMS.** The preparation of noble-metal catalysts resistant to poisoning is a possibility opened up by the following experiment: On SiO<sub>2</sub>/Pt/Si layer catalysts (shown schematically below) in the presence of H<sub>2</sub>, cyclohexene undergoes reaction to give benzene and cyclohexane. The same is true when Pt/Si catalysts are used except that the activity is lower by a factor of 100. SiO<sub>2</sub> overlayers of 0 to 30 nm lower the activity exponentially, after which the value remains constant up to 2200 nm. The results indicate that, instead of the transition-metal surface, 'active hydrogen' (atomic hydrogen) is the true catalytic species. (Author abstract) 14 refs.

## Desorption

**074852 DYNAMICS OF DESORPTION OF CYANOCOBALAMIN FROM MACROPOROUS STYRENE-DIVINYLBENZENE COPOLYMER AND FROM THE CARBOXYLIC CATION-EXCHANGERS SG-1 AND KMT.** In this paper we report the results of studies of desorption of cyanocobalamin from macroporous styrene-divinylbenzene copolymer and from SG-1 and KMT carboxylic cation-exchangers in relation to the grain size of the sorbent, flow rate of the eluant, and the height of the sorbent bed in the column. Cyanocobalamin was desorbed from the macroporous copolymer by percolation in a column of the usual type by dilute solutions of an organic solvent in sorbent beds of various heights and at various eluant flow rates. The results were presented in the form of breakthrough curves for the dependence of the cyanocobalamin concentration in the eluate fractions on the volume of solution passed. Study of the influence of the grain size of the sorbent on desorption of cyanocobalamin from the macroporous copolymer showed that the effectiveness of the process increases substantially with decrease of the grain size. 8 refs.

**074853 DESORPTION OF BENZOPHENONE OXIME MONOLAYERS AT THE AIR/WATER INTERFACE.** The interfacial behavior of 2-hydroxy-5-nonylbenzophenone oxime (HBPO) at the air/water interface has been investigated with Langmuir trough techniques. The dissolution kinetics of HBPO followed a diffusion-controlled model from which the aqueous solubility of HBPO was estimated. Because of deprotonation of the hydroxyoxime group, the aqueous solubility of HBPO was pH dependent. At pH 2.0, the solubility was 0.1  $\mu\text{mole dm}^{-3}$  and increased to 4.0  $\mu\text{mole dm}^{-3}$  at pH 12. From the influence of pH on the dissolution rate, the surface pK<sub>a</sub> for HBPO was estimated to be 11.5. At surface pressures greater than the equilibrium spreading pressure of HBPO (23 mN m<sup>-1</sup>), simultaneous dissolution and monolayer collapse were observed. (Author abstract) 38 refs.

**Diffusion** See Also POLYELECTROLYTES—Chemical Reactions.

**074857 BIDIRECTIONAL COUPLED DIFFUSION OF GLYCINE DRIVEN BY pH GRADIENTS.** Stokes magnetically-stirred diaphragm cells have been used to determine multicomponent diffusion coefficients for aqueous glycine + hydrochloric acid + sodium hydroxide solutions at 25°C. In acidic solutions, pH gradients drive coupled flows of glycine toward the low-pH region of the solution, countercurrent to the flow of H<sup>+</sup> ions. In alkaline solutions, the coupled flow of glycine travels in the opposite direction, 'up' the pH gradient. The diffusion measurements also show that gradients in concentration of glycine can produce large coupled flows of H<sup>+</sup> and OH<sup>-</sup> ions. Equations are developed to predict multicomponent transport coefficients for glycine and related ampholytes in acid-base solutions. (Author abstract) 19 refs.

**074858 BINARY GASEOUS DIFFUSION COEFFICIENTS. 7. TETRACHLOROETHENE AND 1,1,1-TRICHLOROETHANE WITH METHANE AND TETRAFLUOROMETHANE AT 100 kPa AND 283-343 K.** Binary gaseous diffusion coefficients  $D_{12}$  for tetrachloroethene diffusing in methane and tetrafluoroethane and for 1,1,1-trichloroethane diffusing in tetrafluoroethane were measured at about 283, 298, 313, 328, and 343 K and at 100 kPa by the capillary-tube method of Stefan. In addition,  $D_{12}$  for tetrachloroethane in methane and in tetrafluoroethane were determined at 283 and 298 K, respectively. The experimental results are compared with diffusion coefficients calculated via the first-order Chapman-Enskog approximation. For the gases, effective Lennard-Jones [6, 12] pair potential parameters were taken from recent literature; for the heavy chlorinated hydrocarbons the parameters were obtained from semitheoretical extended-corresponding-states correlations. Agreement is satisfactory throughout. (Author abstract) 31 refs.

## Distillation

**074859 ANALYSIS OF THE DISTILLATION RESIDUE FROM DITOLYLEMETHANE COOLANT.** Ditolylemethane (DTM) is used in heat exchangers as a transmitting liquid. DTM is subject to radiolysis, pyrolysis, and oxidation, and carbonaceous deposits appear on the transfer surfaces, which shorten the working life. The components capable of forming deposits in the transmitting surfaces in the core have been identified and the optimum purification technology has been selected from measurements on the compositions of the high-molecular and non-volatile products from DTM. These substances are usually identified by liquid chromatography and molecular spectroscopy, where the mixtures are first separated into fractions having simple compositions. Here the authors give methods of separating the residue into narrow fractions and determination of the main components of these by IR spectroscopy and liquid adsorption chromatography at high pressures. 15 refs.

**074863 VERY SHORT MEAN FREE PATH IN ORGANIC METALS.** Organic metals exhibit relatively high resistivity at ambient temperature and the mean free path  $l$  may be less than the molecular spacing. In one-dimensional metals like TTF-TCNQ, TMTSF $_2$ X, and even doped polyacetylene, a symmetry argument prevents linear coupling between the low-frequency librations and the electrons. In the two-dimensional organic metal NBEDT-TTF $_2$ I $_3$  linear coupling with the librations is possible, resulting in much greater resistivity. A very strong coupling with a very soft phonon of frequency meV has been observed experimentally. The conductivity of the metallic state can be considerably less than N.F. Mott's minimum value, because of interband scattering. (Author abstract) 30 refs.

## Electrochemistry

**074867 ELECTROCHEMICAL BEHAVIOUR OF POTASSIUM FERRICYANIDE, HYDROQUINONE, CATECHOL AND p-AMINOPHENOL AT POLYPYRROLE FILM ELECTRODES.** The electrochemical behavior of potassium ferricyanide, hydroquinone, catechol and p-aminophenol was investigated on a polypyrrole (PPy) film electrode in H $_2$ SO $_4$  electrolyte solution. The voltammograms of these electroactive materials at the PPy film electrode are not controlled by the doping and redoping processes of electrolytes, but by mass transfer or reaction, and their electrochemical reversibility increases to a certain extent on the PPy film electrode compared with that on platinum electrodes. The experiment implies that the PPy film functions as the electron transfer medium in the electrode reaction process of the materials; in this case, PPy acts as both a mediator and an electron conductor. (Author abstract) 19 refs.

**074873 CONCENTRATIONS OF DDT, PCBs, HCB, AND HCH ISOMERS IN THE LIVER AND ADIPOSE TISSUE OF NEWBORN MICE RECEIVING AN EXTRACT OF HUMAN MILK.** Persistent organic chlorine compounds, such as DDT and its metabolites, hexachlorobenzene (HCB) and polychlorinated biphenyls (PCBs) circulate in the food chain of the ecosystems. The purpose of the present study was to investigate the degree

of accumulation of these compounds in the liver and adipose tissue after long-standing feeding them with an extract of human milk with added organic chlorine compounds in doses received by human newborns with milk. In the assessment of the relationship between the degree of accumulation of various compounds in the tissues of newborn mice and the daily dose concentrations were used similar to those found in human milk. 8 refs.

**074874 FIELD STUDY OF THE URINARY EXCRETION OF ETHOXYACETIC ACID DURING REPEATED DAILY EXPOSURE TO THE ETHYL ETHER OF ETHYLENE GLYCOL AND THE ETHYL ETHER OF ETHYLENE GLYCOL ACETATE.** The urinary excretion of ethoxyacetic acid (EAA) was studied in a group of five women daily exposed to the ethyl ether of ethylene glycol (EGEE) and the ethyl ether of ethylene glycol acetate (EGEE-Ac) during 5 d of normal production and 7 d after a 12-d production stop. The mean combined exposure concentration of EGEE and EGEE-Ac (expressed in equivalent weight of EGEE) was 14.0 mg/m<sup>3</sup> with occasional slight excursions above the current Belgian occupational exposure limit. The daily combined exposure profiles for EGEE and EGEE-Ac were rather constant during the first observation period, but they tended to decrease during the last week. The urinary EAA excretion clearly increased during the work week. Over the weekends the elimination was far from complete. Additional study results are discussed. (Edited author abstract) 15 refs.

**074875 HUMAN EXPOSURE TO VOLATILE ORGANIC COMPOUNDS IN HOUSEHOLD TAP WATER: THE INDOOR INHALATION PATHWAY.** This paper addresses the quantification of human exposure to volatile organic compounds (VOC's) as a result of mass transfer from tap water to indoor air. A three-compartment model is developed and used to simulate the 24-h concentration profile within the shower, bathroom, and remaining household volumes of a dwelling. Mass transfers from water to air are derived from measured data for radon and adjusted to account for the difference in mass-transfer properties for VOC's. A preliminary data base for household parameters is used to calculate a range of concentrations and human exposures in U.S. dwellings. The model is used to estimate exposure factors for seven compounds - chloroform, ethylene dibromide, dibromochloropropane, methylchloroform, perchloroethylene, trichloroethylene, and carbon tetrachloride. **074876 NEW SOLVENT-RECOVERY TECHNOLOGY.** The Environmental Protection Agency's EPA's volatile-organic-compound emission standards are becoming stiffer, and smaller sources are expected to come under increasing scrutiny. This article reviews conventional removal processes. It also describes a new system that recovers a wide variety of organic compounds, including single and mixed solvents, at high levels of collection efficiencies.

**074878 EVALUATION OF POTENTIAL MECHANISMS GOVERNING DIOXIN CONGENER PROFILES IN SOILS NEAR COMBUSTION SOURCES.** Non isomer-specific photochemical attack and thermal equilibration are identified as plausible dioxin removal mechanisms from the surface of flyash. A first-order congener ratio decay model is used to generate tentative removal rates that range from 41 h<sup>-1</sup> for T<sub>4</sub>CDD/OCDD to 5 h<sup>-1</sup> for H<sub>7</sub>CDD/OCDD. These rates may be compared against predictions of candidate removal mechanisms. Differential settling of particulates of various sizes may also contribute to the shift in congener ratios observed in the vicinity of combustion sources, and it is likely that a combination of processes should be considered in future work. **074879 CHLORINATED DIOXINS AND DIBENZOFURANS IN PERSPECTIVE (PAPERS PRESENTED AT THE 189TH NATIONAL MEETING OF THE AMERICAN CHEMICAL SOCIETY).** This conference proceedings contains 37 papers which are organized into six sections with the following areas of interest: human exposure; incineration emissions; soil contamination; bioassays; analytical methods; and synthesis and destruction. Some of the topics discussed by the papers are here cited as examples; chlorinated dioxin and dibenzofuran levels in human adipose tissues from exposed and control populations; thermal combustion of octachlorodibenzofuran to form lower PCDFs; solubility of 2,3,7,8-TCDD in contaminated soils; studies on the molecular basis of TCDD-caused changes in proteins associated with the liver plasma membrane; dioxin residues in fish and other foods; mathematical and statistical methods in modeling the Seveso dioxin episode; preparation of dioxin standards for chemical analysis; and destruction of dioxin-containing wastes in a mobile incinerator system. Technical and professional papers from this conference are indexed and abstracted with the conference code no. 11077 in the Ei Engineering Meetings (TM) database produced by Engineering Information, Inc.

**074880 ISOMER-SPECIFIC DETERMINATION OF POLYCHLORINATED DIBENZO-p-DIOXINS AND DIBENZOFURANS IN INCINERATOR-RELATED ENVIRONMENTAL SAMPLES.** Polychlorinated dibenzo-p-dioxins (PCDDs) and dibenzofurans (PCDFs) ranging from tetra- to octachloro congeners in ash and fly ash from incinerators, river water, effluent water from incinerators, groundwater, soil, and sediment were determined isomer specifically by high-resolution gas chromatography-mass spectrometry in order to manifest an environmental situation polluted with those compounds in Japan. The most toxic 2,3,7,8-tetrachlorodibenzo-p-dioxin was detected only in fly ash. In many samples, octachlorodibenzo-p-dioxin had the highest abundance in PCDDs, and heptachlorodibenzofurans had the highest abundance in PCDFs. Gas chromatography-mass spectrometry was used to identify the

graphic patterns of PCDDs and PCDFs in all samples were compared with each other, and results are discussed. (Edited author abstract) 33 refs.

**074881 MUTAGENIC ACTIVITY OF PARTICULATE ORGANIC MATTER COLLECTED WITH A DILUTION SAMPLER AT COAL-FIRED POWER PLANTS.** Stack and ambient samples of particulate matter were collected with a dilution sampler at three coal-fired power plants in West Virginia. Samples were sequentially extracted with cyclohexane (CX), dichloromethane (DCM) and acetone (ACE) and tested for mutagenicity in the Ames Salmonella/microsome assay using TA98 (-S9). The cyclohexane- and dichloromethane-soluble fractions of the stack samples from all locations exhibited mutagenicity when tested in the plate incorporation assay. No significant response was observed with the acetone fraction. When tested with Kado's modification of the preincubation assay, the acetone-soluble fraction did exhibit mutagenic activity comparable to that of the other fractions when expressed in units of revertants per milligram of particulate matter. Chemical analyses of one of the acetone-soluble fractions indicated that half of the mass was sulfuric acid while the remainder consisted of C, H and O. Additional aspects of the study are discussed. (Edited author abstract) 39 refs.

**074882 PERFORMANCE AUDIT RESULTS FOR VOLATILE POHC MEASUREMENTS.** Audit materials containing principal organic hazardous constituents (POHCs) have been developed by EPA for use by federal, state, and local agencies or their contractors to assess the accuracy of measurement methods used during RCRA trial burn tests. Audit materials are currently available for 27 gaseous organics in five, six, seven, and nine-component mixtures at parts-per-billion levels in compressed gas cylinders in a balance gas of nitrogen. Subsequent to completion of the stability studies, 89 performance audits have been conducted with the audit materials to assess the accuracy of the Volatile Organic Sampling Train (VOST) and bag measurement methods during or prior to RCRA trial burn tests. A summary of the audits conducted for each POHC and the measurement system audited is shown in this paper. (Edited author abstract) 5 refs.

**074883 SEASONAL AND TEMPORAL CHANGES OF ORGANIC COMPOUNDS IN RAIN AND SNOW.** Alkylbenzenes, polycyclic aromatic hydrocarbons and chlorinated hydrocarbons were determined in rain and snow collected during 1985 at an urban site in Switzerland. Although great variations in concentrations were found for each season and type of precipitation event, concentrations and wet depositions of the investigated compounds were significantly lower in summer than in winter precipitation. Snow contained the highest concentrations of alkylbenzenes, i.e. total concentrations of up to  $10 \mu\text{g l}^{-1}$ . Non-polar organic chemicals, measured sequentially during three rain events, exhibited a variety of temporal trends which can best be explained by changing sources and moving air masses. (Author abstract) 25 refs.

**074884 DEVELOPMENT AND EVALUATION OF A NOVEL GAS AND PARTICLE SAMPLER FOR SEMIVOLATILE CHLORINATED ORGANIC COMPOUNDS IN AMBIENT AIR.** A prototype annular diffusion denuder inlet has been adapted to a dichot-

mous sampler for the collection of organic compounds which occur in both the gas and particulate phase. The inlet selectivity removes and efficiently preconcentrates atmospheric vapor-phase components by molecular diffusion prior to the collection of the particulate phase (coarse and fine fractions) by filtration. Backup adsorbent cartridges collect any vapor-phase constituents which might volatilize from the collected particulate matter and submicron particles which might penetrate the filter media. Special techniques were developed for coating the annular denuder with solid adsorbents. Laboratory tests with lindane and hexachlorobenzene have demonstrated better than 98 percent trapping efficiency over a 24-h sampling period at contaminant concentrations representative of ambient air and under most simulated atmospheric conditions. (Author abstract) 36 refs.

## Esterification

**074885 INFLUENCE OF REACTION CONDITIONS ON MAIN AND SIDE REACTIONS DURING THE TRANSESTERIFICATION OF DIMETHYL TEREPHTHALATE WITH 1, 4-BUTANEDIOL.** The transesterification of dimethyl terephthalate (DMT) with 1, 4-butanediol (BD) has been studied by measuring the amount of methanol and tetrahydrofuran formed during the reaction. Investigation of various catalyst systems revealed that titanium isopropoxide was a better catalyst than conventional transesterification catalysts such as manganese and cobalt acetates. Increases in the temperature, BD/DMT ratio, and catalyst concentration led to higher production of methanol. (Edited author abstract) 4 refs.

## Etching

**074886 Ar<sup>+</sup> PLASMA ETCHING OF PALMITIC ACID MULTILAYERS: DIFFERENTIAL EROSION RATES OF EXPOSED AND PROTECTED LAYERS.** The degree of spatial resolution obtainable by ion etching was examined by analyzing palmitic acid multilayers, of the type originally described by Langmuir and Blodgett, after erosion in a low-energy Ar<sup>+</sup> plasma. Etching of multilayers revealed that the rate of loss (by sputtering) of the reference bilayer depended critically on the number of protecting, nonradioactive layers. More protection was afforded by four than by two bilayers and more by two than by one. Similar experiments involving multilayers containing a reference (radioactive) monolayer revealed significant protection when the reference layer was covered by a single palmitic acid monolayer. Chemical analysis after etching of exposed and covered bilayers demonstrated that a single bilayer was able to protect a reference layer from significant covalent chemical damage by the Ar<sup>+</sup>-beam. Together the results indicate that plasma etching techniques may be employed to resolve structures in biological materials if they are separated by distances comparable to one to two palmitic acid monolayers. (Edited author abstract) 15 refs.

## Evaluation

**074887 COMPUTATIONAL EVALUATION AND COMPARISON OF SOME NITRAMINE PROPERTIES.** A computational study of six nitramines, R<sub>1</sub>R<sub>2</sub>NNO<sub>2</sub>, has been carried out with the objective of gaining a better understanding of how the properties of the NNO<sub>2</sub> group are affected by the natures of R<sub>1</sub> and R<sub>2</sub>. An ab initio SCF procedure was used, with the initial step being the determination of each molecule's optimized geometry. This was subsequently used to compute its bond orders,

dipole moment, and electrostatic potential. In most instances, the NNO<sub>2</sub> portions of the molecules are planar, due to the strong electron-withdrawing effect of the nitro group; the amino-type nitrogen can better respond to this when in a planar configuration. (Edited author abstract) 31 refs.

**074888 ORGANICS IN WATER: SOLID PHASE EXTRACTION ON A SMALL SCALE.** Octadecyl (C-18) bonded to porous silica has been evaluated for the solid-phase extraction (SPE) of organic compounds from water. Excellent performance was deduced from average recovery of >85% for pesticides and polycyclic organic materials present in contrived water samples at 1-10 ng/mL. Extraction results showed effective performance of the SPE when 1-100 mL of water was passed through small columns containing 40-100 mg of 40- $\mu\text{m}$  C-18 bonded porous silica at flow rates as high as 250 bed volumes/min. (Edited author abstract) 23 refs.

**074889 EXTRACTION OF RESORCINOL BY SULFOXIDES.** Extraction by alcohols has received the greatest amount of attention [2-7]. Information on the extraction of resorcinol by neutral organophosphorus extractants is scanty, and there have been no reports of the extraction of resorcinol by sulfoxides. The authors have examined the extraction of resorcinol by sulfoxides, and obtained information on the mechanism of extraction. It is shown that sulfoxides are efficient extractants for resorcinol. It is found that under the conditions of extraction by sulfoxides a nonhydrated disolvate and a monosolvate-monohydrate of resorcinol are formed. 13 refs.

**074891 FLUORESCENCE QUENCHING AND COPPER COMPLEXATION BY A CHESTNUT LEAF LITTER EXTRACT: SPECTROSCOPIC EVIDENCE.** Fluorescence quenching on addition of Cu(II) to aqueous solutions of chestnut (*Castanea sativa* L.) leaf litter extract (LLE) has been interpreted previously in terms of Cu complexation by LLE organic ligands. In order to provide direct evidence for the existence of these complexes, as well as information about their coordination structures, infrared (IR) and electron spin resonance

(ESR) spectroscopy were applied to investigate Cu/LLE mixtures that showed increasing fluorescence quenching with increasing pH. The Cu/LLE mixtures were prepared with approximately equimolar concentrations of Cu and LLE binding sites (200 mmol m<sup>-3</sup>) at pH values in the range 4 to 7. The IR spectra indicated the existence of Cu complexes involving carboxylate groups, even at pH 4. (Edited author abstract) 19 refs.

**074893 SUPERCRITICAL EXTRACTION OF CROTALARIA SPECTABILIS IN THE CROSS-OVER REGION.** Previous experimental results indicated that a single-stage supercritical extraction process could not be used to isolate monocrotaline since the lipid material is always extracted with the monocrotaline. A study was conducted to examine the feasibility of isolating pure monocrotaline from a complex extract using cross-over phenomena. It differs from the work of E.H. Chimowitz and K.J. Pennisi in that the solute is a multicomponent system consisting of the polar monocrotaline and a series of nonpolar lipids. It is shown that utilization of the temperature-solubility cross-over region exhibited by solutes in supercritical fluids is a promising isolation technique in multicomponent separations. However, when the substrate is a complex biological material consisting of a large number of components, multiple separations may be necessary to isolate pure components. 3 refs.

**074894 PERVAPORATION: IMPORTANCE OF CONCENTRATION POLARIZATION IN THE EXTRACTION OF TRACE ORGANICS FROM WATER.** The extraction of trichloroethylene in dilute aqueous solutions by pervaporation was studied using silicone tubing as a membrane. In this process, the feed water solution flows over the surface of the membrane while a portion of the solution, enriched in contaminant, is transported through the membrane and emerges as vapor. The vapor is then condensed in a cold trap. The aqueous feed solution was fed through the fiber bores of a hollow fiber membrane module. Analysis at the inlet and the outlet of the bundle was performed with a gas chromatograph using an electron capture detector. The reduction in contaminant level at outlet of the module was evaluated as a function of different inlet feed concentrations and axial Reynolds numbers. (Edited author abstract) 13 refs.

**Forming** See Also CATALYSTS—Aluminum Compounds; CHEMICAL EQUIPMENT—Reactors; OLEFINS—Forming; POLYSTYRENES—Oxidation.

**074896 KINETICS OF FORMATION OF METHANE AND ETHANE GAS HYDRATES.** An intrinsic kinetic model with only one adjustable parameter is proposed for the formation of methane and ethane gas hydrates. Experimental formation data were obtained in a semi-batch stirred tank reactor. The experiments were conducted at four temperatures from 274 to 282 K and at pressures ranging from 0.636 to 8.903 MPa. The kinetic model is based on the crystallization theory, while the two-film theory model is adopted for the interfacial mass transfer. Experiments were performed at various stirring rates to define the kinetic regime. The study reveals that the formation rate is proportional to the difference in the fugacity of the dissolved gas and the three-phase equilibrium fugacity at the experimental temperature. This difference defines the driving force which incorporates the pressure effects. (Edited author abstract) 24 refs.

Englezos, P. (Univ of Calgary, Calgary, Alberta, Can); Kalogerakis, N.; Dholabhai, P.D.; Bishnoi, P.R. *Chem Eng Sci* v 42 n 11 1987 p 2647-2658.

**074897 KINETICS OF GAS HYDRATE FORMATION FROM MIXTURES OF METHANE AND ETHANE.** Experimental data on the kinetics of formation of gas hydrates from three mixtures of gaseous methane and ethane are reported. The experiments were conducted in a semi-batch stirred tank reactor at temperatures from 273 to 284 K and of pressures from 0.68 to 5.60 MPa. An intrinsic kinetic model for the growth of the gas hydrate is proposed. It is extension of the model for pure component hydrate formation. The model is based on the crystallization theory coupled with the two-film theory for the gas absorption into the liquid phase. The model does not contain any adjustable parameters. The kinetic rate constants which appear in the model are those obtained previously from pure component formation data. The results indicate that the formation rate is proportional to a linear combination of the differences in the fugacities of the dissolved gases and their three-phase equilibrium fugacities at the experimental temperature. (Edited author abstract) 27 refs.

Englezos, P. (Univ of Calgary, Calgary, Alberta, Can); Kalogerakis, N.; Dholabhai, P.D.; Bishnoi, P.R. *Chem Eng Sci* v 42 n 11 1987 p 2659-2666.

**074898 DIOXINS SOURCES, COMBUSTION THEORIES AND EFFECTS.** The author explains what dioxins (PCDDs) and the closely related furans (PCDFs) are, their dangers, where they are principally found and how they can be controlled. Of particular concern are the emissions from incinerator plants, especially those burning household, industrial and clinical waste. It is shown that from a regulatory viewpoint, greater attention must be directed towards the standardisation of methods used for sampling and analysis of gaseous and particulate emissions, especially when relating the results obtained to

the incinerator operation. (Edited author abstract) 13 refs.

Oakland, D. (London Scientific Services, Engl). *Filtr Sep* v 25 n 1 Jan-Feb 1988 p 39-41.

**074899 FORMATION OF 2-ETHYL ACRYLEIN BY GAS PHASE ALDOL CONDENSATION.** The gas phase aldol condensation between n-butyraldehyde and formaldehyde to give 2-ethyl acrolein, CH<sub>2</sub>=C(C<sub>2</sub>H<sub>5</sub>)-CHO, over a silica supported tungsten oxide catalyst, by feeding formaldehyde as hemiformal or trioxane, over a wide range of operating conditions has been studied. A maximum selectivity of about 95% to 2-ethyl acrolein based on n-butyraldehyde at 275-300°C, by using a feeding molar ratio of formaldehyde (supplied as hemiformal) to n-butyraldehyde of about 2 to 1, with 50% n-butyraldehyde conversion, was found. The reaction studied could provide a viable alternative to the usual liquid phase process for the synthesis of 2-ethyl acrolein. (Author abstract) 22 refs.

Albanesi, Giancarlo (Parma Univ, Parma, Italy); Moggi, Pietro. *Appl Catal* v 37 n 1-2 Feb 15 1988 p 315-322.

**074900 FORMATION OF HCN AND ACETYLENE OLIGOMERS BY PHOTOLYSIS OF AMMONIA IN THE PRESENCE OF ACETYLENE: APPLICATIONS TO THE ATMOSPHERIC CHEMISTRY OF JUPITER.** HCN is formed by the photolysis of ammonia in the presence of acetylene at room temperature. There is a 70% decrease in the yield of HCN when the temperature is lowered to 178 K and two new reaction products, acetonitrile and acetaldehyde ethylenedihydrazide (6), are formed. Photolysis of 6 yields acetonitrile, and the hydrogen atom initiated decomposition of acetonitrile yields HCN. Aziridine, a predicted reaction intermediate, was not detected at 298 or 178 K. Oligomers of acetylene are also formed. Oligomers formed by the photolysis of ammonia in the presence of acetylene were shown by Fourier transform infrared spectroscopy to contain NH groupings and to differ from those produced by the direct photolysis of acetylene. The possible role of these photochemical processes on the formation of HCN and chromophores on Jupiter, Titan, and comets is discussed. (Author abstract) 70 refs.

**074901 FORMATION OF ANISOTROPIC MESOPHASE OF PHOSPHATIDYLCHOLINE IN ALKANE/ WATER SYSTEM BY THE ACTION OF ELECTRIC FIELD.** The formation of a phosphatidylcholine anisotropic mesophase in n-heptane induced by the action of weak electric fields has been observed. It is shown that the produced phase is homogeneous and differs in refractive index from the environmental solution. The phase bears a close resemblance to a gel. With the electric field switched-off, the gel is no longer retained in the interelectrode space and is seen to deposit on the immiscible liquid interface and to gradually dissipate therefrom. (Edited author abstract). 10 Refs.

## Grafting

**074902 GRAFTING OF MALEIC ANHYDRIDE TO n-EICOSANE.** Maleic anhydride was grafted to the linear hydrocarbon, n-eicosane, at 165°C in the presence of the free radical initiator, 2,5-dimethyl-2,5-di(t-butylperoxy)-3-hexyne. The anhydride has a low solubility in eicosane and a multiple addition procedure was adopted. Grafted product which separated from the reaction mixture was fractionated and analyzed. The fractions contained on average 2-5.5 anhydride units/eicosane residue. <sup>1</sup>H- and <sup>13</sup>C-NMR studies show that the grafts consist of single succinic anhydride rings. At the concentrations of maleic anhydride chosen for homogeneous reaction (<0.02 M) and at 165°C, poly(maleic anhydride) is above its ceiling

temperature, so that succinic anhydride radicals cannot add maleic anhydride to form polymer side chains. (Edited author abstract). 11 refs.

**074903 HYDRATION OF p-ALKOXY- $\alpha$ - $\alpha$ -TRIFLUOROACETOPHENONE AND WATER ACTIVITY AT A MICELLAR SURFACE.** Equilibrium hydration of p-methoxy- $\alpha$ - $\alpha$ -trifluoroacetophenone (MTFA) in water and anionic micelles of sodium dodecyl sulfate (SDS) has been followed by  $^{19}\text{F}$  NMR and UV spectrometry. Comparison of hydration equilibria obtained by UV and NMR measurements provides a test of the assumptions about extinction coefficients which are involved in the estimation of hydration equilibria by UV spectrometry. Attainment of hydration equilibria can be followed by UV spectrometry without making assumptions regarding extinction coefficients. We also examined hydration in aqueous MeCN and compared effects of micelles and organic solvents. (Edited author abstract) 14 refs.

**074904 REACTION ANALYSIS OF CATALYTIC HYDROGENATION OF 1,4-BUTYNE-2,3-DIOL.** The hydrogenation of 1,4-butyne-2,3-diol over Raney nickel catalyst for butynediol synthesis has been investigated. The optimum operating conditions with proper catalyst concentrations, agitation intensities, hydrogen pressures and reaction temperature sequences have been verified under the guidance of the basic reaction engineering principles. It has been proved that the reaction rates and the selectives are greatly influenced by the concentration of hydrogen on catalyst surface. (Author abstract) 8 refs. In Chinese.

**074905 COPPER-CATALYZED DECHLORINATION/HYDROGENATION OF POLYCHLORINATED DIBENZO-P-DIOXINS, POLYCHLORINATED DIBENZOFURANS, AND OTHER CHLORINATED AROMATIC COMPOUNDS.** The recent discovery that fly ash samples from different waste incineration facilities catalyze a dechlorination/hydrogenation of polychlorinated dibenzo-p-dioxins (PCDD) and polychlorinated dibenzofurans (PCDF) at temperatures below 300°C prompted the authors to test metals and metal oxides for such a catalytic activity. Copper was found to catalyze the dechlorination/hydrogenation of octaCDD and octaCDF at low temperatures, leading either to mixtures of chlorinated dibenzodioxin or dibenzofuran congeners or to the disappearance of PCDD or PCDF below limits of detection. The time dependence and temperature dependence of the copper-catalyzed dechlori-

nation of octaCDD and octaCDF were studied in detail, and results are discussed. Polychlorinated biphenyls (PCBs) and chlorobenzenes as well as brominated dibenzo-p-dioxins and brominated dibenzofurans were found to undergo decomposition in the presence of copper powder. (Edited author abstract) 7 refs.

**074906 HYDROGENATION OF ANILINE IN PRESENCE OF  $\text{Ru}(\text{OH})\text{Cl}_3$ .** Hydrogenation of aniline in the presence of  $\text{Ru}(\text{OH})\text{Cl}_3$  was carried out without preliminary saturation of the catalyst with hydrogen. The solvent, ruthenium salt, aniline, and oxide (if added) were put into the reaction vessel simultaneously. Experimental evidence indicates that during hydrogenation of aniline in the presence of  $\text{Ru}(\text{OH})\text{Cl}_3$  the reaction order with respect to hydrogen decreases from close to 1 to zero with increase of pressure to 10 MPa. The reaction order with respect to the substrate is fractional. The total apparent activation energy is 66.1 kJ/mole and remains unchanged with increase of the hydrogen pressure from 2 to 8 Pa. Conversion of aniline is complete; the catalyze consists of a mixture of only two products, cyclohexylamine and cyclohexanol. The cyclohexylamine yield increases with increase of the hydrogen pressure from 2 to 10 MPa, and of the temperature from 363 to 393 K. The catalyst obtained from  $\text{Ru}(\text{OH})\text{Cl}_3$  is more stable in the course of the reaction than metallic or supported catalysts prepared by the usual methods. 4 refs.

**074907 CORRELATION OF RATES OF ALKENE HYDROGENATION CATALYZED BY RHODIUM COMPLEXES.** The application of linear free energy relationships (LFER) to rate and equilibrium data of organic reactions yields important information on the mechanism and allows prediction of the reactivity of related compounds. It has been shown that the LFER are useful also in the field of heterogeneous catalysis. As substituent parameters for the LFER, the  $\sigma$  constants for polar effects and various constants for steric effects have been tested; their numerical values were taken from a critical compilation. The most successful correlation, based on standard steric  $E_s$  constants, is given. It confirms quantitatively and specifies the qualitative conclusion of the authors that the predominant structural influence upon reactivity is steric hindrance. All the correlations mentioned establish a link between homogeneous and heterogeneous catalysis; the common features of alkene hydrogenation are thus manifested. 10 refs.

**074909 SPECIFICITY OF THE CATALYTIC ACTION OF Pt AND Ni IN THE HYDROGENATION OF p-BENZOQUINONE.** It was shown for the first time that in the presence of Ni and Pt, p-benzoquinone is hydrogenated with the formation not only of hydroquinone but also of 1,4-cyclohexanediol. The rate of formation of 1,4-cyclohexanediol is approximately 1/20 of the

rate of formation of hydroquinone. Small additions of alkali (0.001 M) to the reaction system lead to a change in the selectivity of the process on Pt; the only hydrogenation product is hydroquinone; in the case of Ni, the direction of the reaction is unchanged. (Author abstract) 7 refs.

**074910 EFFECT OF CHEMICAL COMPOSITION OF SUPPORTED METAL CATALYSTS ON THEIR ACTIVITY AND SELECTIVITY IN THE HYDROGENATION REACTION OF ACETONITRILE.** The catalytic properties of transition metals on various supports in the gas phase hydrogenation reaction of acetonitrile have been studied at atmospheric pressure. The specific catalytic activity with respect to the total process is determined mainly by the chemical nature of M and decreases as the energies of the M-nitrile and M-H bonds increase. The selectivity with respect to primary amine decreases as the surface acidity of the catalyst increases, while the selectivity increases for secondary amine and reaches a maximum for tertiary amine. (Author abstract) 15 refs.

Golodets, G.I. (Acad of Sciences of the Ukrainian SSR, Kiev, USSR); Pavlenko, N.V.; Prokhorenko, E.V. *Kinet Catal* v 28 n 3 pt 1 May-Jun 1987 p 544-550.

**074911 SELECTIVITY IN NITRILE HYDROGENATION CATALYZED BY GROUP VII METALS.** This work is devoted to an analysis of the factors which affect the selectivity of this process in the direction of obtaining primary amines and which are connected primarily with the strength of adsorption of intermediate reaction products on transition metals. Experimental data on the hydrogenation of acetonitrile over various catalysts are given. They show that both the activity of metals of group VIII and also the proportion of hydrogenation products observed for them vary within a wide range. Thus, over cobalt, a more than 90% yield of primary amine is attained, while on Pd it is not formed at all. This difference may be caused by a different ability of the metals to adsorb the intermediate reaction products. Although the results of the calculations performed and the conclusions drawn from them relate primarily to the catalytic hydrogenation of aliphatic nitriles, it may be assumed that the same catalyst properties determined their selectivity in the other process of aldehyde hydrogenation, which is related to hydrogenation in mechanism also. 12 refs.

**074912 ELEMENTARY MODELLING OF HYDROGENATION KINETICS ON THE WORKING CATALYST SURFACE: A STUDY OF GAS PHASE AND LIQUID PHASE HYDROGENATION IN THE PRESENCE OF SUPPORTED Ni, NiS AND Pd CATALYSTS.** The hydrogenation of 2-ethyl-hexenal to observed products has been extensively studied. The hydrogenation kinetics were examined at low pressure gas phase conditions as well as intermediate pressure liquid phase conditions, in the presence of commercial as well as model catalysts with Pd, Ni or NiS as active components. In addition, the kinetics of aldehyde (2-ethyl-hexenal and 2-ethyl-hexanal) adsorption and desorption in presence and absence of hydrogen have been investigated. Qualitative aspects concerning the structures of adsorbed aldehydes and kinetics of hydrogen adsorption were studied and the kinetics of liquid phase hydrogenation of 2-ethyl-hexenal and 2-ethyl-hexanal were examined. An extraordinarily high selectivity for 2-ethyl-hexanal formation was observed when Pd or NiS catalysts were employed. On nickel catalysts, on the other hand, the

further hydrogenation of 2-ethyl-hexanal to 2-ethyl-hexanol was readily catalyzed. (Edited author abstract) Refs. Smedler, Gudmund (Chalmers Univ of Technology, Goteborg, Sweden). *Chalmers Tek Hogsk Doktorsavh* 646 1987 265p.

**074913 EFFECT OF SOLVENT AND REACTION MEDIUM ON THE KINETICS AND MECHANISM OF THE CATALYTIC HYDROGENATION OF VARIOUS AROMATIC COMPOUNDS ON GROUP VIII METALS. VIII. HYDROGENATION OF BENZYLIDENEACETONES ON RHODIUM BLACK AT DIFFERENT pH VALUES.** The catalytic hydrogenation of benzylideneacetone and its derivatives has been studied on rhodium black catalyst in aqueous alcohol buffer solutions in the pH range 2-11. The pH dependence of the hydrogenation rate constants has been found to consist of two separate lines which intersect at pH = ca. 7.5, for all compounds studied. The data obtained in this paper are thus in excellent agreement with the electrochemical model for the catalytic hydrogenation of organic compounds in electrolyte solutions. (Edited author abstract) 6 refs.

Finkel'shtein, A.V. (Siberian Technological Inst, Krasnoyarsk, USSR); Rybintsev, V.V. *Kinet Catal* v 28 n 4 pt 2 Jul-Aug 1987 p 875-877.

**074914 HYDROGENATION OF 2-ETHYL-1,4-DIHYDROANTHRAQUINONE IN THE PRESENCE OF PALLADIUM CATALYST.** The hydrogenation reaction of 2-ethyltetrahydroanthraquinone has been studied in a slurry reactor, in the presence of a palladium-supported catalyst. This chemical reaction is very fast, and a mass-transfer regime is always operative. Gas-liquid and liquid-solid mass-transfer coefficients have been determined by experiments performed both in the presence and in the absence of the reaction. The values obtained are quite the same in both cases. Kinetic runs show that, if the catalyst holdup is changed, a critical catalyst concentration exists at which any additional amount of catalyst is ineffective in promoting the reaction rate. (Edited author abstract) 16 refs.

Santacesaria, E. (Univ di Napoli, Naples, Italy); Wilkinson, P.; Babini, P.; Carra, S. *Ind Eng Chem Res* v 27 n 5 May 1988 p 780-784.

**074915 STOICHIOMETRIC HYDROGENATION AND HYDROFORMYLATION OF CYCLOPENTENE WITH COBALT TETRACARBONYL HYDRIDE IN THE PRESENCE OF HYDROGEN OR DEUTERIUM.** The authors investigated the transformation of  $\text{HCo}(\text{CO})_4$  (1) to  $\text{Co}_2(\text{CO})_8$  (2) and  $\text{H}_2$  under 100 bar  $\text{D}_2$  at 25°C in n-heptane. By carrying out the same experiment in the presence of equimolar amounts of  $\text{HCo}(\text{CO})_4$  (1) and cyclopentene, the following facts were established. (1) The rate of disappearance of 1 is much faster in the presence than in the absence of the olefin. (2) The rate of formation of 2 is much faster in the presence than in the absence of cyclopentene, and the amount of 2 formed is greater than that predicted by equilibrium (1). (3) Both cyclopentane and formylcyclopentane are formed. (4) Deuterium is partially incorporated into the reaction products, showing that, under the conditions used, activation of  $\text{D}_2$  takes place. 12 refs.

**074916 SELECTIVE HYDROGENATION OF NEAT ISOQUINOLINE I. ACTIVITIES OF SOME COMMERCIAL CATALYSTS AND EFFECTS OF COEXISTING SULPHUR-CONTAINING COMPOUNDS IN THE SUBSTRATE.** Isoquinoline obtained from coal-tar was hydrogenated over several commercial catalysts to tetrahydroisoquinolines and decahydroisoquinolines without any solvent or acid. 1,2,3,4-Tetrahydroisoquinoline exclusively is obtained with Raney nickel and ruthenium on carbon from isoquinoline containing a sulphur compound which is identified as thieno [3,2-b]pyridine. The same compound was also obtained

with copper-chromite or platinum on carbon from sulphur-free isoquinoline. When Raney nickel was employed with sulphur-free isoquinoline under relatively high temperature and low pressure (205-210°C and 15-25 kg/cm<sup>2</sup>), 5,6,7,8-tetrahydroisoquinoline and trans-decahydroisoquinoline could be selectively prepared at 90 percent and 80 percent yields, respectively, by adjusting the reaction time. **074917 INTERACTION OF MOLECULES WITH MOLYBDENUM DISULPHIDE CATALYSTS: AN EXPERIMENTAL AND MOLECULAR GRAPHICS STUDY. ISOPRENE.** The interaction of isoprene with molybdenum disulphide has been studied by computer-assisted modelling of the binding of the molecule at active sites. Possible structures of intermediate-active-site complexes were evaluated by the method of molecular mechanics. For isoprene hydrogenation the preferred catalytic sites, according to energy minimisation calculations, proved to be corner molybdenum atoms having threefold unsaturation. This conclusion agrees with deductions from experimental studies of isoprene hydrogenation. The modelling studies are valuable for revealing the steric relationships between active sites and substrate molecules, for calculating the most likely structures, and for revealing non-bonded interactions. (Author abstract) 7 refs.

**074918 HYDROLYSIS OF ACRYLONITRILE TO ACRYLAMIDE OVER AN ION-EXCHANGED COPPER ON SILICA CATALYST.** The deactivation of a copper on silica catalyst prepared by the ion-exchange technique for the hydrolysis of acrylonitrile (AN) to acrylamide (AA) has been studied at temperatures below 350 K. Initial deactivation is attributed to a polymer network coating the outer particle surface and originating from the product. Due to the nature of the polymer and the fine catalyst support pore structure, a major part of the active copper sites remains accessible and the catalyst retains its activity over a long time and broad range of reactant and product concentrations, but undergoes very slow and constant deactivation by copper oxidation from oxygen dissolved in the reactant mixture. (Edited author abstract) 25 refs.

**074921 KINETIC MODEL OF THE HYDROLYSIS OF p-NITROPHENYL ACETATE IN FROZEN SUSPENSIONS OF SILICA GEL.** A kinetic model of the hydrolysis of p-nitrophenyl acetate in frozen suspensions of silica gel based on the experimental results of a study of the reaction kinetics, the phase state of the frozen suspensions, and the absorption of p-nitrophenyl acetate on the surface of silica gel has been proposed. Theories concerning the existence in frozen multicomponent heterogeneous systems of reaction zones differing in composition and with respect to the concentrations of the components of the mixture have been introduced. It has been shown that highly dispersed insoluble additions influence the rates of chemical reactions in frozen systems, altering not only their phase state, but also the properties of the reaction medium, particularly the ionic composition. (Author abstract) 4 refs.

Sergeev, G.B. (M.V. Lomonosov Moscow State Univ, USSR); Sergeev, B.M.; Konstantinova, N.R. *Kinet Catal* v 28 n 4 pt 1 Jul-Aug 1987 p 716-722.

**074922 EFFECT OF A SUBSURFACE SEDIMENT ON HYDROLYSIS OF HALOALKANES AND EP-OXIDES.** Neutral and base-catalyzed hydrolyses of isopropyl bromide, 1,1,2,2-tetrachloroethane, 1,1,1-trichloroethane, and ethylene dibromide were studied in pure water and in barely saturated subsurface sediment at 25-60°C. Half-lives in sediment at 25°C were 2.1, 29, 450 (measured), and 1500 days (calculated), respectively. No significant differences in the kinetics or products were observed in the sediment pores compared to those in water at the same pH, indicating that the effects of ionic strength, surface catalysis, and adsorption are unimportant for the low-carbon sediment studied. Thus, kinetic and product data for haloalkanes obtained in pure water are applicable to such groundwater systems. On the other hand, epoxide hydrolysis can be affected by the presence of sediments; styrene oxide (acid catalyzed below pH 7) hydrolyzed 4 times faster in sediment than in buffered water and also formed benzaldehyde by oxidation. (Author abstract) 27 refs.

Haag, Werner R. (SRI, Menlo Park, CA, USA); Mill, Theodore. *Environ Sci Technol* v 22 n 6 Jun 1988 p 658-663.

**074923 KINETICS OF THE HYDROLYSIS OF TRICHLOROMETHYLBENZENE IN WATER-ACETONE MIXED SOLVENTS.** The kinetics of the hydrolysis of trichloromethylbenzene in water-acetone solutions have been studied over the temperature range 30-45°C. The rate of the reaction have been followed by conductance measurements. The rate is first order with respect to the trichloromethylbenzene and is independent of the concentration of water. When the concentration of water in the solvent is increased, the hydrolysis rate constant first decreases to a minimum at about 0.5 water mol fraction, then increases. The influence of solvent variation on reaction rates has been examined in terms of changes in activation parameters. The results are discussed in terms of the electrostatic theory, polarity of the medium and on the change in the solvent structure. (Author abstract) 22 refs.

## Ignition

**074924 STUDIES ON THE SYNERGISTIC HYPERGOLIC IGNITION OF HYBRID SYSTEMS.** A variety of solid organic compounds, such as Schiff bases, azines, hydrazones, thiocarbonohydrazones, thiosemicarbazones, and hydroxy compounds, on mixing with metal powders, especially with magnesium, become synergistic

cally hypergolic with white fuming nitric acid (WFNA). In the absence of magnesium powder, these compounds are either nonhypergolic or have longer ignition delays, when WFNA is used as oxidizer. The synergistic ignition behavior has been explained in terms of increased exothermicity of the system, primarily due to the heat evolving chemical reactions occurring between the fuels (organic compound and magnesium) and the oxidizer in the preignition stage. (Author abstract) 21 refs.

## Impurities

**074925 EFFECTS OF SELECTED ALCOHOLS ON CYCLODEXTRIN INCLUSION COMPLEXES OF PYRENE USING FLUORESCENCE LIFETIME MEASUREMENTS.** This study focuses on the inclusion complexes of  $\gamma$ -cyclodextrin with pyrene as indicated by fluorescence lifetime measurements and the effects of alcohols on these systems. The pyrene complex has a longer lifetime than free pyrene, yet quenching is observed in the presence of  $\gamma$ -cyclodextrin. This apparent conflict is discussed. Also, short-chain alcohols participate in the pyrene/ $\gamma$ -cyclodextrin inclusion complexes producing a longer lifetime of the pyrene complex. This participation is described through evaluation of the lifetime data. (Edited author abstract) 22 refs.

Nelson, Gregory (Emory Univ, Atlanta, GA, USA); Patony, Gabor; Warner, Isiah M. *Anal Chem* v 60 n 3 Feb 1 1988 p 274-279.

## Ionization See Also PLATINUM COMPOUNDS—Adsorption.

**074926 IONIZATION EFFICIENCIES OF  $C_3H_6$ ,  $C_4H_8$ ,  $C_5H_{12}$ ,  $C_2H_6O$ , AND  $C_3H_8O$  ISOMERS.** Ionization efficiencies of 14 organic compounds have been measured in the wavelength region from 105 to 134 nm using an ionization chamber. The compounds examined are cyclopropane, propylene, 1-butene, isobutene, cis- and trans-2-butenes, cyclohexane, 1-hexane, tetramethylethylene, ethyl alcohol, dimethyl ether, n-, and iso-propyl alcohol, and ethyl methyl ether. The ionization efficiencies of cyclopropane and cyclohexane monotonically increase with increasing photon energy, but those for the others show a peak or a shoulder in the wavelength region of the present work. (Author abstract) 16 refs.

## Isomerization See Also CATALYSTS—Evaluation; ION EXCHANGE RESINS—Chemical Reactions.

**074929 PHOTSENSITIZED ISOMERIZATION OF NORBORNADIENE FOR SOLAR ENERGY STORAGE AND SUPPRESSION OF SIDE REACTION.** Photosensitized isomerization of norbornadiene to quadricyclene was investigated by using several photosensitizers such as toluene, acetone, acetophenone, benzophenone and  $\alpha$ -naphthoquinone. The effect of wavelength on the quantum yield of quadricyclene and on the energy conversion efficiency was measured by using spectroirradiator. The formation of byproduct polymer in the presence of photosensitizers was also studied. The formation of polymers during irradiation, which prevents the repeated use of energy storage material, was effectively suppressed by the addition of several phenolic substances into norbornadiene. (Author abstract) 32 refs.

Taoda, Hiroshi (Government Industrial Research Inst, Nagoya, Jpn); Hayakawa, Kiyoshi; Kawase, Kaoru. *J Chem Eng Jpn* v 20 n 4 Aug 1987 P 335-338.

**074930 HYDROFORMYLATION AND ISOMERIZATION REACTIONS OF HEX-1-ENE CATALYZED BY RHODIUM COMPLEXES.** The hydroformylation of hex-1-ene (at 1 atm and 40°C) with various rhodium compounds as catalysts has been studied. Catalytic activity of both catalysts is comparable with that found for the  $Rh(acac)[(OPh)_3]_2 + nP(OPh)_3$  systems, however, an induction time was not observed. The effect of  $H_2/CO$  ratio on the yield of hydroformylation reaction products was investigated.  $HRh[P(OPh)_3]_4$  as well as  $Rh(acac)[P(OPh)_3]_2 + nP(OPh)_3$  gave optimal yields of aldehyde (ca. 70%) when  $H_2/CO = 1$ . (Author abstract) 9 refs.

Trzeciak, A.M. (Univ of Wroclaw, Wroclaw, Pol); Ziolkowski, J.J. *J Mol Catal* v 43 n 3 Jan 1988 p 335-341.

**074931 ISOMERIZATION OF METHYL LINOLEATE ON SUPPORTED RUTHENIUM-NICKEL CATALYST.** Isomerization of methyl linoleate on supported ruthenium catalyst is studied with the aid of an unsteady-state mathematical model. The model developed is found to describe the observed behavior well. The rate constants and the activation parameters in the model are estimated by fitting the simulation to the experimental data. The effects of the ruthenium-nickel ratio, support, catalyst activation temperature, and preparation conditions on the selectivity for conjugation, polymerization, hydrogenation, and geometric isomer distribution are discussed in detail. It is noted that isomerization precedes hydrogenation, while polymerization is a competing parallel reaction. (Edited author abstract) 20 refs.

## Labeling See SURFACES—Spectroscopic Analysis.

## Low Temperature Effects

**074932 LOW-TEMPERATURE (23 K) STUDY OF L-ALANINE.** From a spherical crystal of L-alanine an extensive set of X-ray diffraction data has been measured at 23 (1) K. No phase transition has been observed on cooling, and the cell parameters of the orthorhombic crystals (space group  $P2_12_12_1$ ) are, at the temperature of data collection,  $a = 5.928$  (1) Angstrom,  $b = 12.260$  (2) Angstrom,  $c = 5.794$  (1) Angstrom. The contraction of the cell volume, with respect to the room temperature

value, amounts to 2.2%. Intensity data, carefully corrected for scan-truncation losses, have been analyzed with various models. The best fit was reached by interpreting the electron density function in terms of pseudatoms (multipoles). The analysis of the correlation coefficients has shown that the quality and quantity of the data set allowed a reliable deconvolution of thermal motion from the charge density. (Edited author abstract) 36 refs.

## Low Temperature Properties

**074933 ANALYSIS OF THE LOW-TEMPERATURE PHASE OF THE ORGANIC CONDUCTOR (FLUORANTHENE) $_2PF_6$  WITH MAGNETIC RESONANCE.** In order to clear up the electronic structure of the low-temperature phase of the organic conductor (fluoranthene) $_2PF_6$ , we combined the knowledge available from the electrical conductivity and the static magnetic susceptibility with the information accessible by different magnetic resonance techniques: ESR of defects and conduction electrons (intensity, g-tensor, linewidth,  $T_2$ , diffusion constant and  $T_1$ ) and proton-NMR (linewidth), all measured for different qualities of (FA) $_2PF_6$ -single crystals in dependence of the sample orientation, the temperature and the Larmor frequency. Thus we report on comprehensive results for a model system of the organic conductor. (Author abstract) 27 refs.

Sachs, G. (Univ Bayreuth, Bayreuth, West Ger); Poehlmann, E.; Dormann, E. *J Magn Magn Mater* v 69 n 2 Oct II 1987, Sel Pap from the 1987 Arbeitsgem Magn Meet, Freudenstadt, West Ger, Mar 9-13 1987 p 131-143.

## Magnetic Field Effects

**074934 DIFFERENTIAL THERMAL ANALYSIS OF THE FIELD INDUCED PHASE TRANSITIONS OF (TMTSF) $_2ClO_4$  ABOVE 1.2 K.** We present results of a differential thermal analysis of the magnetic field induced phase transitions in the organic conductor (TMTSF) $_2ClO_4$  above 1.2 K. This study shows that transitions between different spin density wave states are first order and that the total entropy change involved in the two detected transitions (in the temperature range 1.2-2 K) is close to that of the quasi-one-dimensional electron gas. Above 2 and 4.2 K, only a single transition has been detected in our measurements. The entropy of that transition decreases and extrapolates to zero near 5 K. We present some arguments suggesting that if longitudinal nesting ( $2k_F$ , 0, 0) is to take place in the semi-metallic SDW phase at high fields it exists only above 2 K or so. (Edited author abstract) 26 refs.

## Magnetic Properties See Also POLYMERS—Conductive.

**074935 C\*-MAGNETORESISTANCE OF  $\beta$ -(BEDT-TTF) $_2I_3$  IN THE HIGH- $T_c$  STATE: KOHLER'S RULE.** We report a study of Kohler's rule for  $\beta$ -(BEDT-TTF) $_2I_3$  in the high- $T_c$  state (obtained by pressure cycling, i.e. cooling under pressure and removing the pressure at low temperature) in the temperature range 8-22 K and fields up to 9.4 T for  $c^*$  current flow, perpendicular to the highly conducting ab plane. It is observed that magnetoresistance  $\Delta\rho/\rho_0$  is a universal function of  $H/\rho_0$  (Kohler's rule), and we give an estimation of the interchain overlap integral, the mean free paths in the chain direction ( $l_{||}$ ) and along  $c^*$  ( $l_{||}$ ), as well as the relaxation time  $\tau$ . (Author abstract) 15 refs.

Hamzic, B. (Univ de Paris-Sud, Orsay, Fr); Creuzet, G.; Lenoir, C. *J Phys F Met Phys* v 17 n 11 Nov 1987 p 2267-2272.

**074936 MAGNETIC AND SPECTROSCOPIC PROPERTIES OF**  $[\text{Co}(\text{AGIH})_{2\text{py}2}][\text{Cr}(\text{NH}_3)_2\text{NCS}]_4$  AND  $[\text{Co}(\text{AGIH})_{2\text{py}2}][\text{Co}(\text{NH}_3)_2(\text{NO}_2)_4]\text{COMPLEXES}$ . The magnetic and spectroscopic (UV, visible-IR and electron paramagnetic resonance spectra) properties of the molecular complexes  $[\text{Co}(\text{AGIH})_{2\text{py}2}][\text{Cr}(\text{NH}_3)_2\text{NCS}]_4$  and  $[\text{Co}(\text{AGIH})_{2\text{py}2}][\text{Co}(\text{NH}_3)_2(\text{NO}_2)_4]$  (where  $\text{AGIH}_2$  is diamonoloxoyne) have been examined in solid state. The molecular structure of the complexes and the nature of the interaction in the crystals has been considered. (Author abstract) 13 refs.

**074937 ELECTRIC-FIELD-DEPENDENCE OF THE SMALL-PERIOD OSCILLATION OF THE MAGNETORESISTANCE IN  $(\text{TMTSF})_2\text{ClO}_4$** . The electric field effects on the small-period oscillation of the magnetoresistance in  $(\text{TMTSF})_2\text{ClO}_4$  were investigated in high magnetic fields. It was found that the oscillation amplitude decreased with increasing electric fields and was smeared out at sufficiently high electric fields. The present results suggest a possibility of some kind of tunneling effect as the mechanism of the small-period oscillation and are analyzed on the basis of the recent tunneling theory by Yamaji. (Author abstract) 18 refs.

**074938 PARTIALLY DEUTERATED TETRAMETHOXYDIBENZOFURAN-HEXAFLUOROPHOSPHATE: AN ELECTRON SPIN RESONANCE STUDY**. The susceptibility of the compound is large,  $\chi(300\text{ K}) = 3.8 \times 10^{-4}$  emu/mol, and the temperature dependence of the susceptibility is explained by the random exchange Heisenberg antiferromagnetic chain model. The localization of the electrons in an antiferromagnetic order is proved by the angular dependence of the ESR linewidth, which corresponds to dipole-dipole interaction. A comparison of the spin properties between the title compound and a non-deuterated compound exhibits only minor differences. 11. AA Refs.

**074939 HIGH FIELD MAGNETIC SUSCEPTIBILITY OF INDIVIDUAL SINGLE CRYSTALS OF THE ORGANIC CONDUCTOR (FLUORANTHENE) $_2\text{PF}_6$** . Using single crystals of a sufficient size (4-7 mg) and a high quality (about  $5 \times 10^{-4}$  paramagnetic defects per formula unit) we measured the anisotropic static magnetic properties of the quasi-1d organic conductor  $(\text{FA})_2\text{PF}_6$  in external fields of up to 70 kOe. Thus the strong anisotropy of the molecular diamagnetism was determined for the first time. The contribution of the conduction electrons to the static susceptibility of  $(\text{FA})_2\text{PF}_6$  was separated. We analyzed the influence of fluctuations (pseudogaps) in the metallic high temperature phase and we derived the temperature dependence of the energy gap in the low-temperature ( $T > 185\text{ K}$ ) semiconducting phase of  $(\text{FA})_2\text{PF}_6$ . **074940 FLUORESCENCE LIFETIME STUDY OF CYCLODEXTRIN COMPLEXES OF SUBSTITUTED NAPHTHALENES**. The interactions of  $\alpha$ ,  $\beta$ , and  $\gamma$ -cyclodextrins and selected naphthalene derivatives as observed through fluorescence lifetime measurements are discussed in detail. These systems can be quickly

characterized with the use of the parameters obtained from experimental fluorescence decay curves. The formation of inclusion complexes can be followed with the appearance of a long-lived fluorophore which contributes to the total fluorescence according to the cyclodextrin concentration. This fluorophore is determined to be an inclusion complex between a naphthalene and cyclodextrin. (Author abstract) 15 refs.

**074941 FLUORESCENCE-DETECTED LOW FIELD RESONANCES IN T-T ANNIHILATION IN THE A-TCNB SINGLE CRYSTAL: LINESHAPE AND DYNAMIC PARAMETERS**. An investigation is made of the line shape of the low field resonances observed in the dependence of the fluorescence of a single A-TCNB CT crystal on the external magnetic field. It is shown that the resonance is caused by avoided crossing of magnetic sublevels of a single T-exciton arising when the direction of the field is close to the axis of the fine interaction tensor. An analytic expression for the resonance line shape is obtained. The spin-lattice relaxation rate of T-excitons,  $\tau^{-1} = (1.0 \pm 0.3) \times 10^7\text{ s}^{-1}$  as well as the rate of jumps between the planes of fast exciton migrations,  $\omega_1 = (5 \pm 2) \times 10^7\text{ s}^{-1}$ , are determined. (Author abstract) 15 refs.

**074942 TIME-DEPENDENCE OF THE GROWTH OF THIN ORGANIC LIQUID LAYERS ON A GOLD SURFACE, STUDIED BY SURFACE-PLASMON POLARITON TECHNIQUES**. The novel use of surface-plasmon polaritons to study the build-up thin organic liquid films onto a planar gold surface by vapor deposition has recently been reported. We extend the work here by studying the time-dependent nature of this process in greater detail. We report, for the first time, the coexistence of two SPP features at the same interface; the first corresponding to a SPP between the gold and a thin organic film; and the second to a SPP between the gold and bulk-liquid. This observation is reconciled with the model to thin fluid films on a solid planar surface attached by van der Waals bonding. (Author abstract) 2 refs.

## Melting

**074944 ULTRASONIC METHOD FOR THE ACCURATE DETERMINATION OF THE MELTING LINE: DATA FOR CYCLOHEXANE AND BENZENE**. The p-T melting curves of cyclohexane and benzene were measured accurately at pressures up to 85 MPa and 175 MPa respectively using an ultrasonic method. Important features of this new method are that the phase transition is studied by monitoring changes in the attenuation of ultrasonic echoes and that the measurements start in a non-equilibrium two-phase region, the partially solidified liquid, created by superpressing the liquid sample. The accuracy of the experimental melting temperatures for both liquids is about 0.03 K. The

Simon-Glatzel equation, fitted to the experimental data, can be extrapolated to 500 MPa without introducing large errors. (Author abstract) 12 refs.

## Microscopic Examination

**074945 RESULTS OF LASER-INDUCED FLUORESCENCE OF ORGANIC MATERIALS**. A new laser-induced fluorescence microscopy system has been developed to significantly broaden the analytical scope of the characterization of organic materials. The system uses a pulsed tunable dye laser interfaced to a Leitz MPV3 fluorescence microscope. The fluorescence of the organic materials is excited with ultraviolet radiation in the range of 260-450 nm and analyzed between 300 and 800 nm. The temporal decay of the fluorescence induced by the pulsed laser is studied. The anode pulses from a fast photomultiplier detecting the fluorescence are digitized by a fast waveform digitizer, and the information is then processed by a desk-top computer to obtain the decay curves and the corresponding decay times. The technique of pulse counting is employed for greater sensitivity in detecting weakly fluorescing materials. Results of this technique from the fluorescence of coal macerals and dispersed organic material in sedimentary rocks indicate that characterization in the time domain is an expansion of conventional fluorescence analysis.

## Mixing

**074946 ELECTROLYTIC PROPERTIES OF  $\text{LiClO}_4$ -PROPYLENE CARBONATE MIXED WITH AMIDE-SOLVENTS FOR LITHIUM BATTERIES**. The electrolytic properties of propylene carbonate (PC) mixed with amide-solvents incorporating  $\text{LiClO}_4$  as the solute were examined for application to lithium (Li) batteries. The amide-solvents used were N,N-dimethylformamide (DMF), N,N-dimethylacetamide (DMA) and N,N-dimethylacetamide (DMAA). Conductivities for PC mixed with amide-solvents were higher than that for PC alone. For example, 1M  $\text{LiClO}_4$ -PC/DMA (mixing volume ratio = 1/1) showed 2.7 times higher conductivity of  $1.64 \times 10^{-2}\text{ Scm}^{-1}$  at 25°C than PC. This higher conductivity is due mainly to the lowered viscosity which results from mixing amide-solvent with PC. The selective solvation of DMA with  $\text{Li}^+$  ion in  $\text{LiClO}_4$ -PC/DMA was clearly apparent in  $^{13}\text{C}$ -NMR spectra. (Edited author abstract) 19 refs.

## Molecular Weight

**074951 SOLUTION AND SOLID-STATE STRUCTURES OF Di-n-BUTYLtin 3-THIOPROPIONATE. X-RAY CRYSTAL STRUCTURE DETERMINATION OF THE CYCLIC HEXAMER.** Molecular weight and  $^{13}\text{C}$  and  $^{119}\text{Sn}$  NMR data for di-n-butyltin 3-thiopropionate indicate that monomer and at least two oligomers are in equilibrium in solution. The  $^{119}\text{Sn}$  chemical shift and tin-carbon coupling constants indicate that the associative interaction gives rise to five-coordinate tin. Complicated concentration and temperature effects on the  $^{119}\text{Sn}$  NMR spectra are rationalized by postulating the existence of a third oligomeric form at high concentration; solution viscosity measurements suggest that this species may be a linear polymer. Full structural analysis of the monoclinic modification reveal the presence in the unit cell of two crystallographically independent cyclic hexamers in which the carboxylate group bridges between tin atoms. (Edited author abstract) 26 refs.

Lockhart, Thomas (DuPont, Wilmington, DE, USA). *Organometallics* v 7 n 6 Jun 1988 p 1438-1443.

**074952 ON THE MOLECULAR WEIGHT OF PECTIC SUBSTANCES AND ITS RELATION TO THEIR GEL STRENGTHS.** A study has been made on the possibility of determining the molecular weight  $M_w$ , the second virial coefficient  $A_2$  and the radius of gyration by measuring the light scattering of pectin aqueous solutions.

The experimental data were processed on a computer by using an algorithm, accounting for the effect of microgel formations in the pectic solution. A tendency towards a decrease in  $M_w$  when decreasing the degree of esterification for a certain type of pectin was established and was confirmed by the change in the intrinsic viscosity. This fact is explained by degradation during deesterification. (Edited author abstract). 32 Refs.

**074954 COMPARISON OF THE ELECTRONIC STRUCTURE OF DISUBSTITUTED FERROCENES.** We have measured the optical absorption of gaseous ferrocene, 1,1'-dimethylferrocene, 1,1'-dibromoferrocene, and 1,1'-dichloroferrocene using synchrotron radiation. From these data we have estimated the ligand field parameters and noted increasing  $e_2(d)$  to  $\text{Cp}(\pi)$  overlap with increasing charge transfer from the Cp ring to the substitution. The optical absorption spectra for ferrocene, dibromoferrocene, and dichloroferrocene are remarkably similar. The halogen substitutions result in greater  $\text{Cp}(\pi)$  to  $e_2(d(x^2-y^2))$  hybridization. The  $e_2g$  orbitals become more bonding while the  $a_{1g}$  and  $e_{1g}$  orbitals become more non-bonding or antibonding. This change is reflected in a change of the ligand field parameters. **074958 ELECTRO-OXIDATION BEHAVIOUR OF SOME METHOXYANTHRACENES IN BENZONITRILE.** Electro-oxidation behavior of 9,10-dimethoxy- and 9-cyano-10-methoxyanthracenes on a Pt electrode was investigated in benzonitrile containing tetra-n-butylammonium perchlorate using controlled potential electrolysis, cyclic voltammetry and ESR spectroscopy. The concentration of protons produced during electro-oxidation was determined spectroscopically. Anthraquinone was found to be the major product of electro-oxidation of these two compounds. (Author abstract) 18 refs.

Ozyoruk, Haluk (Hacettepe Univ, Ankara, Turk); Yildiz, Atilla. *Electrochim Acta* v 32 n 9 Sep 1987 p 1311-1314.

**074959 OLIGOMERIZATION OF 4-CHLOROANILINE BY OXIDOREDUCTASES.** Oxidation of aromatic amines by oxidoreductases can result in the formation of polyaromatic products. We incubated 4-chloroaniline with horseradish peroxidase and with a laccase from the fungus *Trametes versicolor*. Qualitative and quantitative analyses were performed on the oligomeric products. Both enzymes generated eight oligomers, which were isolated and identified. On the basis of their structures and rates of formation, a reaction scheme for the oxidative oligomerization of 4-chloroaniline was proposed. The scheme shows that, once the substrate was enzymatically oxidized, free-radical coupling followed, and three dimeric intermediates were produced. Each of the dimers initiated a nonenzymatic reaction pathway, and the combined pathways accounted for the formation of the first eight stable 4-chloroaniline-derived oligomers. (Author abstract) 16 refs.

**074960 LIQUID PHASE OXIDATION OF CYCLOHEXENE WITH ALCOHOLIC PALLADIUM(II) SALTS.** The oxidation of cyclohexene to cyclohexanone with alcoholic palladium(II) salts has been investigated. The best result in the catalyst system studied was obtained with the  $\text{PdCl}_2\text{-CuCl}_2\text{-2H}_2\text{O}$  couple. However, further oxidations of cyclohexanone significantly occurred, i.e., cyclohexanone was oxidatively dehydrogenated to 2-cyclohexen-1-one, which then afforded 3-ethoxy-2-cyclohexen-1-one by an oxipalladation mechanism, resulting in a decrease in the cyclohexanone selectivity. (Author abstract) 11 refs.

Takehira, Katsuomi (Tsukuba Research Cent, Yatabe, Jpn); In Hwan Oh; Martinez, Victor C.; Chavira, Rodolfo S.; Hayakawa, Takashi; Orita, Hideo; Shimidzu, Masao; Ishikawa, Toshio. *J Mol Catal* v 42 n 2 Oct 1987 p 237-246.

**074961 PALLADIUM(II)-CATALYZED OXIDATION OF CYCLOPENTENE IN THE PRESENCE OF COPPER(II) CHLORIDE AND MOLECULAR OXYGEN.** The oxidation of cyclopentene to cyclopentanone with alcoholic palladium(II) salt has been investigated. PdCl<sub>2</sub> coupled with CuCl<sub>2</sub> or FeCl<sub>3</sub> as co-catalyst afforded cyclopentanone with high yield in alcoholic solvents at moderate temperatures. Under atmospheric pressure of oxygen, use of FeCl<sub>3</sub> as co-catalyst resulted in high selectivity to cyclopentanone, >90%, at approx. 50% cyclopentene conversion. An increase in oxygen pressure to 490.3 kPa favored the selective oxidation with PdCl<sub>2</sub>-CuCl<sub>2</sub> catalyst, to afford the almost complete conversion of cyclopentene to cyclopentanone. The PdCl<sub>2</sub>-CuCl<sub>2</sub> couple catalyzed the mono-oxygenation of cyclopentene to cyclopentanone with dioxygen, the reaction rate depending greatly on the oxygen pressure. These results cannot be accounted for by the conventional Wacker-type catalysis; a hydroperoxopalladium(II) species coupled with Cu(II) is most likely the active species. (Author abstract) 10 refs.

**074962 DETERMINATION OF THE PARAMETERS OF ELECTROCHEMICAL FURFURAL OXIDATION AT A CARBON ELECTRODE IN A CONTINUOUS CELL.** It was the task of this investigation to find the optimum conditions of electrochemical furfural oxidation to  $\beta$ -formylacrylic acid in the cell proposed. The solution concentration of furfural and the qualitative and quantitative composition of the reaction products were determined in these investigations by the procedures developed previously. The results obtained when investigating the influence on the FAA yields of current density, furfural starting concentration, and contact time between anode and solution to be oxidized are reported. It is shown that at the different starting concentrations and current densities, a certain time of contact between anolyte and electrode must not be exceeded for maximum FAA yields, since otherwise the FAA is oxidized to maleic acid. At a given current density, the contact times required for maximum FAA yield increased when the furfural starting concentration is increased. 7 refs.

**074963 PREPARATION OF 2-SUBSTITUTED BENZOXAZOLES FROM PHENOLIC SCHIFF BASES BY COPPER(II) CHLORIDE-CATALYZED OXIDATION WITH DIOXYGEN IN PYRIDINE.** N-alkylidene-2-hydroxyanilines are oxidized by dioxygen to 2-substituted benzoxazoles in good yields when initiated by copper(I) chloride in pyridine. The overall rate of dioxygen consumption obeys second-order kinetics. The reaction rate is independent of the substrate concentration, indicating that the oxidation of Cu(I) is rate-limiting. (Author abstract) 39 refs.

**074964 ELECTROCHEMICAL OXIDATION OF 1,3-CYCLOHEXADIENE.** The electroinitiated cation radical Diels-Alder reaction was attempted for 1,3-cyclohexadiene in methylene chloride with tetrabutylammonium tetrakisfluoroborate as the supporting electrolyte. The expected end o/exo adducts (4:1) were formed in very low yields. The major product was characterized by <sup>1</sup>H and <sup>13</sup>C NMR as polycyclohexadiene with mainly 1,4-addition mode segments. Different voltages, supporting electrolytes, electrode materials, and concentrations were used in an effort to optimize reaction results. Polymerization was still a major competing reaction, but the use of tetrabutylammonium hexafluorophosphate as supporting electrolyte was still a major competing reaction, but the use of tetrabutylammonium hexafluorophos-

phate as supporting electrolyte and of graphite electrodes instead of platinum, improved the Diels-Alder adduct yield. (Edited author abstract) 24 refs.

**074966 VAPOUR PHASE OXIDATION OF 2,6-LUTIDINE TO 2,6-PYRIDINEDICARBOXYALDEHYDE. III: KINETIC STUDY.** The oxidation reaction of lutidine (LUT) was carried out at 390-450°C over V-Mo-oxide catalyst, in presence of excess steam. A much simplified, but still significant kinetic model was obtained, useful for the design of a pilot plant, in view of a possible practical development of the process. The apparent  $\Delta E_a$  for the main reactions of the model range from ca. 111 to ca. 198 kJ mol<sup>-1</sup>, except for the formation of the heterocyclic byproducts from the lutidine-mono- and di-carboxaldehydes, for which a  $\Delta E_a$  of only 54 kJ mol<sup>-1</sup>, was found. LUT seems to absorb on the catalyst more strongly than the partially oxidised products. (Author abstract) 13 refs.

**074967 COMPLETE CATALYTIC OXIDATION OF VOLATILE ORGANICS.** Heterogeneous catalytic oxidation of organic compounds is an important and intensely studied area. However, most reported research deals with the partial oxidation of petrochemical feedstocks to make products of economic value (e.g., ethylene oxide from ethylene), automotive exhaust catalysts, or CO oxidation. Complete (or —deep—) catalytic oxidation of low molecular weight volatile organic compounds (VOCs) in air has received relatively little attention. This review of heterogeneous catalytic oxidation focuses on its application to control of VOCs at operating conditions typical of field applications. The parameters for this review are low to moderate temperatures (25-400°C), atmospheric pressure, high space velocity (10<sup>3</sup>—10<sup>5</sup> h<sup>-1</sup>), and low organic reactant concentration (roughly 10<sup>2</sup>—10<sup>3</sup> ppm) in air. (Author abstract) 125 refs.

**074968 PARALLEL AND SERIAL NETWORKS IN THE MECHANISM OF THE OSCILLATING BELOUSOV-ZHABOTINSKY REACTION. THE TANDEM OSCILLATOR.** After some historical introduction the problem of non-bromide controlled oscillations is discussed. An experimental proof for a fast  $\text{Ag}^+ + \text{Br}^- \rightarrow \text{AgBr}$  precipitation reaction is presented. This proves that in the presence of silver ions bromide cannot play the role of the control intermediate; it must be another chemical species. For the role of the second control intermediate an organic free radical is proposed. It is shown that while bromide is a part of a serial (Explosor type) network the organic free radical is a part of a parallel (Oregonator type) network. Finally, a combination of the two networks the Tandem oscillator is presented. (Author abstract) 61 refs.

**074969 KINETICS AND MECHANISM OF THE OXIDATION OF N,N-DIETHYL-P-PHENYLENE-**

**DIAMINE BY 12-TUNGSTOCOBALTATE(III).** The almost irreversible oxidation of N,N-diethyl-p-phenylenediamine by 12-tungstocobaltate(III) was studied by means of a multi-mixing, stopped-flow apparatus with optical detection. Both unprotonated and simple protonated p-phenylenediamine are oxidized rapidly to form p-semiquinonediimine. The reaction rate is dependent on the concentration of all ions present in the solution, as well as on the choice and concentration of the buffer. The rate constant varies from  $3 \cdot 10^4 \text{ M}^{-1} \text{ s}^{-1}$  to  $1.4 \cdot 10^6 \text{ M}^{-1} \text{ s}^{-1}$  at 25°C. The activation energy in all cases is very small. (Author abstract) 39 refs.

**074970 SYNTHESIS OF AROMATIC NITRILES BY VAPOUR PHASE CATALYTIC AMMOXIDATION.** V/Ti/O catalysts, active for the mild oxidation of o-xylene, were tested in the ammoxidation of different alkylaromatics. The presence of substituents on the aromatic ring was found to slightly influence the reactivity of the hydrocarbon; both electron donor and acceptor groups showed an activating effect with respect to toluene. This was taken as an indication that the slow step of the reaction consists in a homolytic scission of the C-H bond, thus involving a radical intermediate species. (Edited author abstract) 30 refs.

Cavani, Fabrizio (Dep of Industrial Chemistry & Materials, Bologna, Italy); Parrinello, Fiorenzo; Trifiro, Ferruccio. *J Mol Catal* v 43 n 1 Nov 2 1987 p 117-125.

**074971 KINETICS AND MECHANISM OF Ru(III)-EDTA CATALYZED OXIDATION OF cis-CYCLOOCTENE BY MOLECULAR OXYGEN.** The homogeneous oxidation of cis-cyclooctene with molecular oxygen catalyzed by potassium chloro(ethylene)diaminetetraacetato)ruthenium(III),  $\text{K}[\text{Ru}(\text{H}_2\text{EDTA})\text{Cl}] \cdot 2\text{H}_2\text{O}$ , was investigated in the temperature range 310-335 K,  $\mu = 0.1 \text{ M KCl}$  in 1:1 water-dioxane mixture. The rate of oxidation of cis-cyclooctene was found to be first order with respect to catalyst and cyclooctene concentrations, and one-half order in molecular oxygen concentration. Based on the kinetic data, a  $\mu$ -peroxoruthenium(IV) cyclooctene complex is suggested as an active intermediate for the formation of cyclooctene oxide as a major product. (Edited author abstract) 23 refs.

**074972 CATALYZED OXIDATION KINETICS OF ANTHRACENE WITH OXYGEN IN ETHYLENE GLYCOL.** The kinetics of liquid-phase oxidation of anthracene to anthraquinone by gaseous oxygen, with  $\text{CuBr}_2$  as a catalyst and ethylene glycol as the solvent, has been studied. The oxidation kinetics, without an induction period, is interpreted by considering an analyzed intermediate compound, and the kinetic constants are evaluated over the temperature range 120-160°C. One mechanism for the reaction which conforms with the experimental results is also proposed. (Author abstract) 16 refs.

Cepeda, Emilio A. (Colegio Universitario de Alava, Vitoria, Spain); Diaz, Mario. *Ind Eng Chem Res* v 26 n 12 Dec 1987 p 2401-2403.

**074973 ASSESSMENT OF CONDITIONS UNDER WHICH THE OXIDATION OF FERROCENE CAN BE USED AS A STANDARD VOLTAMMETRIC REFERENCE PROCESS IN AQUEOUS MEDIA.** The one-electron oxidation process for ferrocene (Fc),  $\text{Fc} \rightleftharpoons \text{Fc}^+ + e^-$ , has been studied extensively by cyclic, normal pulse, and differential pulse voltammetry and chronocoulometry to determine the conditions under which this reaction can be used as a voltammetric standard in aqueous media. In water, the oxidation of ferrocene is not a simple reversible one-electron process as is the case in organic solvents. Rather, weak reactant

adsorption is exhibited, which is electrode and electrolyte dependent. The oxidation of a saturated solution corresponds to considerably less than a monolayer of coverage. (Edited author abstract) 59 refs.

**074974 CHANGES IN THE STEADY ELECTROOXIDATION RATES OF ORGANIC SUBSTANCES ON PLATINUM AND PALLADIUM INDUCED BY THALLIUM MONOLAYER FORMATION ON THESE METALS.** The data show that an accelerating effect of thallium adatoms is displayed at Pt/Pt, only in the oxidation of HCOOH and HCHO at  $E_c$  which are not too high, i.e., precisely in those cases where the contribution of currents due to the oxidation of products of a catalytic decomposition ( $i_c$ ) to the measured values of  $i_a$  is quite large. Two reasons for an increase of  $i_c$  are possible: an acceleration of catalytic decompositions itself and (or) a more difficult removal of the decomposition products from the surface without consumption of charge. The results obtained also show, at the time, that thallium adatoms influence not only  $i_c$  but also - directly - the electrooxidation rate of the chemisorbed species; it follows directly from the data for CH<sub>3</sub>OH that they lower it. Tin adatoms accelerate this process. The data obtained in the polarization measurements of this work allow the basic tasks in mechanistic studies of electrocatalysis by adatoms to be defined, and optimum systems and processes for their experimental accomplishment to be selected. 15 refs.

**074975 CATALYTIC OXIDATION OF THIOCYANATES AND CYANIDES WITH OZONE.** Oxidation of thiocyanates and cyanides with ozone can be used to purify wastewaters from metallurgical plants. To investigate the effect of catalysts of oxidation of thiocyanates and cyanides we used industrial catalysts based on metal oxides. Data are presented that show the relation between concentration of thiocyanate and the cyanide formed during ozonation without a catalyst and with a catalyst. During oxidation of thiocyanate without a catalyst accumulation of cyanide occurs first in the solution. The amount of cyanide then diminishes, since its oxidation to cyanate begins to predominate. In the presence of catalysts SNM-1 and NTK the rate of cyanide oxidation increases sharply. We also investigated the effect of temperature on catalytic oxidation of cyanides. It was found that when catalyst SNK-1 was used with increasing temperature from 25 to 37°C, the rate of oxidation of cyanides increases. These investigations enable us to significantly improve the industrial method for purifying wastewaters from metallurgical plants. This study enables us also to propose an effective and economical catalyst (copper oxide) during oxidation of thiocyanates and cyanides with ozone. The principles of this process will be of assistance in designing new industrial facilities for wastewater purification. 4 refs.

**074977 FORMATION MECHANISM FOR A CATALYST FOR THE SELECTIVE OXIDATION OF ETHYLBENZENE IN THE PRESENCE OF NICKEL BIS-ACETYLACETONATE AND AN ELECTRON-DONOR LIGAND. 1. OXIDATION OPTIMIZATION.** It has been found that there is a considerable increase in the degree of oxidation of ethylbenzene to hydroperoxide as catalyzed by Ni(AcAc)<sub>2</sub>-D complexes (D is hexamethylphosphoramide) when Ni(AcAc)<sub>2</sub> is added. It is suggested that the mechanism involves an increase in the concentration of the oxidation product from the initial Ni(AcAc)<sub>2</sub>-D, which is responsible for the selectivity. Experimental evidence has been obtained that the O<sub>2</sub> is attached in the oxidation of Ni(AcAc)<sub>2</sub>-D on the C-H methine bond in the acetylacetonate ligand. (Author abstract) 13 refs.

Mosolova, L.A. (Acad of Sciences of the USSR, Moscow, USSR); Matienko, L.I.; Skibida, I.P. *Kinet Catal* v 28 n 2 pt 2 Mar-Apr 1987 p 421-425.

**074978 FORMATION MECHANISM FOR A CATALYST FOR THE SELECTIVE OXIDATION OF ETHYLBENZENE IN THE PRESENCE OF NICKEL BIS-ACETYLACETONATE AND AN ELECTRON-DONOR LIGAND. 2. COMPOSITION OF THE CATALYTICALLY ACTIVE COMPLEX.** This study concerns the structure of the oxidation product from Ni(AcAc)<sub>2</sub>-D. Various physicochemical methods have been used together with elemental analysis to show that the oxidation of Ni(AcAc)<sub>2</sub>-MP (MP is N-methylpyrrolid-2-one) gives rise to a binuclear complex of composition Ni<sub>2</sub>(AcAc)(AcO)<sub>3</sub>-MP·2H<sub>2</sub>O (P). Kinetic methods show that this complex P catalyzes the selective oxidation of ethylbenzene to 1-phenylethylhydroperoxide. (Edited author abstract) 9 refs.

**074979 MASS TRANSFER AND SOLUBILITY IN AUTOCATALYTIC OXIDATION OF CYCLOHEXANE.** Mass transfer coefficients for the solution, without reaction, of oxygen in cyclohexane over a wide range of temperature and pressure have been measured in a flat interface reactor (FIR) and a gas sparged stirred-tank reactor (STR). Solubilities have also been measured and it is suggested that a modified Henry's law coefficient of  $1.09 \times 10^{-2}$  kmol/m<sup>3</sup>·bar can be regarded as constant over the temperature range 293-435 K. The physical mass transfer coefficient in the STR shows very little variation over this temperature range and a value of  $3.5 \times 10^{-4}$  m/s can be assumed for 423-435 K. (Edited author abstract) 50 refs.

**074980 AUTOCATALYTIC OXIDATION OF CYCLOHEXANE - MODELING REACTION KINETICS.** Liquid phase oxidation of hydrocarbons is a major source of organic chemicals. This paper concerns itself with the oxidation of cyclohexane. In this paper attention is given to the kinetics and to the interaction of kinetics and mass transfer, showing that in this autocatalytic system the dissolved oxygen level rises to saturation and falls as the rate of reaction increases. Initially zero order in oxygen, the reaction becomes first order at low oxygen levels. (Edited author abstract) 10 refs.

Suresh, A.K. (Monash Univ, Clayton, Aust); Sridhar, T.; Potter, O.E. *AIChE J* v 34 n 1 Jan 1988 p 69-80.

**074981 AUTOCATALYTIC OXIDATION OF CYCLOHEXANE-MASS TRANSFER AND CHEMICAL REACTION.** In an industrial gas-liquid reactor both mass transfer and kinetics have, in principle, a role to play. This paper describes studies on the oxidation of cyclohexane in two-phase, gas-liquid reactors. Regimes of absorption have been clarified by measurements of dissolved oxygen concentrations. The behavior is found to be complex, arising from the fact that no reaction is autocatalytic kinetics, enhanced physical mass transfer rates arise.

(Edited author abstract) 20 refs.

**074984 CATALYTIC OXIDATION OF 1-OCTENE IN THE PRESENCE OF Mn<sub>2</sub>O<sub>4</sub>.** A study has been made of the initial stages in the liquid-phase oxidation of 1-octene in the presence of Mn<sub>2</sub>O<sub>4</sub>. It has been established that the process is initiated by catalytic decomposition of hydroperoxide. The orders of reaction with respect to olefin, hydroperoxide, and catalyst have been determined. Critical quantities of catalyst have been detected. It is suggested that the catalyst surface contains two kinds of active centers on which hydroperoxide is decomposed through radical and molecular paths. It is shown that critical phenomena set in when the rate of hydroperoxide decomposition is greater than the rate of its formation. (Edited author abstract) 9 refs.

**074985 KINETICS OF OXIDATION OF CYANIDE IONS WITH OZONE IN AN ALKALINE MEDIUM.** The authors investigated the kinetics of oxidation of CN<sup>-</sup> ions in alkaline solutions with ozone. They demonstrated that the process occurs under diffusion conditions. They also determined the factors that influence the rate of oxidation with ozone. They refined the values incorporated in the equation of diffusion kinetics which satisfactorily describes the process. 5 refs.

Medvedev, A.S.; Alibekov, G.Ya.; Kashcheev, I.N. *Coke Chem (USSR)* n 4 1987 p 64-68.

**074986 INTRADIFFUSION INHIBITION IN THE ETHYL CHLORIDE OXIDATION PROCESS ON A COPPER-COBALT-CHROME CATALYST.** A determination of the role of intradiffusion inhibition in the catalytic oxidation process of ethyl chloride, the basis of purification of waste gases from this toxic impurity, was

carried out in the present research. The porous structure was investigated of a copper-cobalt-chrome catalyst, deposited in  $\gamma\text{-Al}_2\text{O}_3$ , used in the ethyl chloride oxidation process. It was established that a bidispersed structure is characteristic for this catalyst with a predominance of micropores and macropores. Degrees of use of the internal surface were calculated from structural characteristics of the catalyst and data on kinetics of reaction and were compared with experimentally determined values. A kinetic equation was obtained, expressing the rate of ethyl chloride oxidation on the copper-cobalt-chrome catalyst in the intradiffusion region. (Edited author abstract) 7 refs.

Chernitskii, O.G.; Vlasenko, V.M.; Chernobrivets, V.L.; Denisov, A.A. *Sov Prog Chem* v 53 n 3 1987 p 34-38.

**074987 OXIDATION OF 1-ACETOXYCYCLOHEXENE CATALYZED BY  $\text{VO}^{2+}$ ,  $\text{MoO}_2^{2+}$ , AND  $\text{Cr}^3$  ACETYLACETONATES.** We studied the possibility of obtaining acetoxyketones more selectively during catalytic oxidation of ACH-1 (1-Acetoxy-cyclohexene) in the presence of metal compounds of varying valence: vanadyl, molybdenyl, chromium, and chromium stearate acetylacetonates, which have been shown to be effective catalysts for hydroperoxide decomposition and olefin epoxidation. It is shown that during oxidation of ACH-1 in the presence of  $\text{MoO}_2(\text{acac})_2$ , the concentration of ACHanone-2 (1-Acetoxy-cyclohexane-2-one) and CHenone-1 (2-Cyclohexene-1-one) increases. The increase in the relative content of these compounds is due primarily to a decrease in the amount of ACHenone-3 (1-Acetoxy-cyclohex-3-one). Moreover, at the same oxidation level, the concentration of ACHanone-2 is almost two times higher and that of HP two times lower than in the uncatalyzed oxidation. 11 refs.

**074988 BIOMIMETIC OXIDATION WITH MOLECULAR OXYGEN. SELECTIVE CARBON-CARBON BOND CLEAVAGE OF 1,2-DIOLS BY MOLECULAR OXYGEN AND DIHYDROPYRIDINE IN THE PRESENCE OF IRON-PORPHYRIN CATALYSTS.** The selective carbon-carbon bond cleavage of 1,2-diols in the presence of an iron-porphyrin complex, molecular oxygen, and 1-benzyl-3-carbamoyl-1,4-dihydropyridine is reported. The C-C bonds of aryl-substituted ethane-1,2-diols were cleaved exclusively to aldehydes or ketones as the oxidation products at room temperature. The reaction rates were influenced by the steric hindrance of the substituents both in the catalysts and diols, but no differences in the reactivities were observed between the two stereo isomers (meso and dl) of diols. A kinetic analysis of this bond cleavage reaction is consistent with the reaction mechanism consisting of the initial binding of diol on the active catalyst forming an intermediate complex and its subsequent breakdown in the rate-determining step of the catalytic cycle. (Edited author abstract) 68 refs.

**074990 LIQUID-PHASE OXIDATION OF P-ISOPROPYLPHENYL ACETATE.** The kinetics and products of the initiated liquid-phase oxidation of p-isopropylphenyl acetate (IPPA) in the temperature range 80-115°C have been studied. Yields of hydroperoxide are >90% at low temperature and low conversion. The composite rate constants determined at the different temperatures predict an overall energy of activation of 7.8 kcal/mol. The oxidation is self-retarding, and conversions of about 35-38% are the upper practical limit. The product hydroperoxide is readily rearranged by acid catalysis to hydroquinone monoacetate (and acetone) in ca.90% yield. Computer simulation of the reaction has been accomplished by numerical integration of a 15-step mechanism. (Edited author abstract) 32 refs.

Sickle, Dale E. Van (Eastman Kodak Co, Kingsport, TN, USA). *Ind Eng Chem Res* v 27 n 3 Mar 1988 p 440-447.

**074991 ELECTROCHEMICAL FORMATION OF THE  $\text{PyO}^+$  CATION RADICAL AND ITS REACTION WITH CYCLOHEXANE.** The oxidation of PyO was studied in  $\text{CH}_3\text{CN}$  solution containing 0.2 mole/liter  $\text{LiClO}_4$  on a rotating disk electrode made from carbon glass, using linear and cyclic voltammetry. The half-wave potential  $E_{1/2}$  observed in the irreversible oxidation of PyO to  $\text{PyO}^+$  was  $+1.72 \pm 0.01$  V (relative to SCE). The limiting current  $I_d$  appeared to be diffusion (controlled). Introduction of cyclohexane to this solution resulted in a decrease in  $I_d$ ; the higher the concentration of  $\text{C}_6\text{H}_{12}$ , the more pronounced the decrease in  $I_d$ . The decrease in  $I_d$  can possibly be associated with adsorption of pyridine on the anode, the pyridine being formed in the chemical reaction of  $\text{PyO}^+$  with cyclohexane which occurs after the electrode process. 3 refs.

**074992 KINETIC FEATURES OF THE OXIDATION OF  $\text{C}_2\text{H}_5\text{CHO}$  IN THE REGION OF THE NEGATIVE TEMPERATURE COEFFICIENT OF THE MAXIMUM REACTION RATE. II. INFLUENCE OF THE RATIO OF SURFACE AREA OF VOLUME OF THE REACTION VESSEL.** EPR has been used to study the influence of the surface-to-volume ratio (S/V) of the reaction vessel on the kinetics of the gas-phase oxidation of  $\text{C}_2\text{H}_5\text{CHO}$  in the region of the negative temperature coefficient of the maximum reaction rate. It has been shown that increasing S/V leads to a shift of the region of the negative temperature coefficient toward lower temperatures in a reactor treated with boric acid, while in reactors treated with KCl no negative temperature coefficient is observed. The dependence of the boundary of the region in which the negative temperature coefficient depends on S/V is explained by the breakdown of the radicals  $\text{RCO}$ ,  $\text{RCO}_2$ , and  $\text{RCO}_2\text{H}$  at the surface. (Edited author abstract) 9 refs.

**074993 OXIDATION OF PHOSPHINE BY OXYGEN CATALYZED BY COPPER (II) CHLORIDE COMPLEXES SUPPORTED ON SILICA GEL.** The authors report on a study of phosphine oxidation by oxygen in the presence of  $\text{Cu(II)}$  chloride complexes supported on MSM silica gel. This study includes a determination of the composition of the complexes responsible for catalysis. On the basis of kinetic and potentiometric studies, it has been shown that maximum catalytic activity in the oxidation of phosphine by oxygen is manifested by complexes with the composition  $\text{CuFCl}_3$  (-aq) and  $\text{CuCl}_4^{2-}$  (-aq) supported on MSM silica gel. (Edited author abstract) 14 refs.

**074994 REACTIVITY OF RING-SUBSTITUTED DERIVATIVES OF ALKYL BENZENES IN REACTIONS WITH PEROXY RADICALS.** The reaction of hydrogen atom detachment by peroxy radicals is studied in detail for two reasons. First, it is an important elementary stage of reactions of chain continuation during oxidation of many substances (products of petroleum and carbon chemistry) by oxygen. Second, experimental methods for kinetic measurements have now reached such a level that they enable the rate constants of reactions to be measured with the wide variation in structure of both the molecules and the peroxy radicals for reaction series where the radical is the same but the molecular structure varies and also for reactions of different radicals with the same molecule. In view of this derivatives of alkyl-aromatic compounds have been investigated. Analysis of available data relating to the dependence of the rate constants of ring-substituted alkylarenes on the properties of substituents makes it possible to conclude that the reactivity of particles here is determined on the one hand by the energy factor (the energy of the rupturing and forming bonds), and on the other hand by the polar factor, indicated by the ability of a particle to give and receive electrons. 25 refs.

**074995 ROUTE OF AUTOOXIDATION OF ORGANIC COMPOUNDS THROUGH A METAL ION AND BROMIDE CATALYSIS.** Liquid-phase oxidation of organic compounds is normally an autocatalytic process and proceeds by a branched-chain mechanism through intermediate formation of peroxides. Decomposition of peroxides into free radicals ensures branching of the chain and consequently autoacceleration of the reaction. It is found that when bromine ions are present, the reduction of organic compounds takes place readily in several redox stages, which ensures high effectiveness of the route of autooxidation through a metal ion. The use of this route and the latent catalytic possibilities of metal ions is promising in the development of new effective systems of complete and selective oxidation of organic compounds. 25 refs.

**074996 WET OXIDATION CATALYZED BY RUTHENIUM SUPPORTED ON CERIUM(IV) OXIDES.** The activity of precious metal catalysts in the wet oxidation of organic compounds was investigated. Ruthenium was the most active catalyst among the precious metals examined, and cerium(IV) oxide was the most effective support. The Ru/Ce catalyst rivaled homogeneous copper catalyst, which is used in the practical wastewater treatment, for the oxidation of n-propyl alcohol, n-butyl alcohol, phenol, acetamide, poly(propylene glycol), and acetic acid. In addition, it was especially effective for the oxidation of some compounds with high oxygen content such as poly(ethylene glycol), ethylene glycol, formaldehyde, and formic acid. **074997 ANALYTICAL AND MECHANISTIC ASPECTS OF THE ELECTROCHEMICAL OXIDATION OF KETO STEROIDS DERIVATIZED WITH PHENYLHYDRAZINE, (4-NITROPHENYL)HYDRAZINE, AND (2,4-DINITROPHENYL)HYDRAZINE.** The electrochemical oxidation of biologically important 3- and 17-keto steroids derivatized with phenylhydrazines has been investigated at platinum and glassy carbon electrodes in aqueous methanol. The oxidation process has been used in the amperometric detection of keto steroids in nonmammalian biological fluids after separation by reverse-phase liquid chromatography. The derivatization was shown to be quantitative, and the

response linear with the detection limit of 1-5 ng for injection volumes of 20  $\mu$ L. (Edited author abstract) 34 refs.

**074998 THERMOOSCILLATIONS DURING THE COMPLETE OXIDATION OF ETHYLENE OXIDE OVER A SUPPORTED SILVER CATALYST.** The aim of the present letter is to describe briefly the conditions and the form of these thermooscillations, which were observed for the first time during the catalytic oxidation of ethylene oxide. The catalyst studied contains about 20 wt.% of silver, supported on  $\alpha$ -alumina. Silica was used as a binding compound. 5 refs.

**074999 STUDY OF THE REACTION OF ALKYL CHLOROFORMATES WITH SODIUM PEROXIDE.** The reaction of peroxidation of CFT with a  $C_7$ - $C_9$  alkyl radical by hydrogen peroxide in alkaline medium, determination of the possible side reactions which decrease the yield of the target product, and substantiation of the methods of transformation of the starting reagents as a function of the conditions of synthesis were studied. The results obtained on peroxidation of chloroformates with a number of carbon atoms of  $C_7$ - $C_9$  show that the rate of formation of dialkyl peroxydicarbonates and the occurrence of side reactions of hydrolysis of CFT and peroxydicarbonate in the presence of an emulsifier is a function of the ratio of the starting reagents to a significant degree, primarily the excess of the alkaline component ( $Na_2O_2$ , NaOH), the presence of an organic phase, and to a lesser degree, the temperature. 9 refs.

**075000 HOMOGENEOUS CATALYZED AUTOXIDATION OF C-3-ene.** The liquid-phase autoxidation of car-3-ene in the presence of cobalt acetyl acetonate has been studied kinetically. The desired product, car-3-en-5-one, is an intermediate in one of the routes for the manufacture of synthetic pyrethroid. Several side products are formed, of which the principal is the peroxide. Lower temperature and pressure, higher catalyst usage and a less polar solvent medium each improves the selectivity for the desired ketone. A mathematical model of the reaction is developed after it has been broken down into several basic steps. The rate constants and activation energies for the various steps in the model are estimated by fitting the simulation to the experimental data. (Edited author abstract) 21 refs.

**075001 STUDY OF THE ELECTROOXIDATION OF 1,3-PROPANEDIOL ON A GOLD ELECTRODE IN BASIC MEDIUM.** A study of the mechanism of electrooxidation of 1,3-propanediol on a gold electrode in basic medium has been made. The kinetic parameters measured, together with other experimental data, allow the formulation of a mechanism in which both 1,3-propanediol and  $OH^-$  ions adsorb on the gold surface and the rate determining step is an interaction between both coverages with the result of the formation of an adsorbed radical, whose oxidation leads to the formation of 3-hydroxypropanoic acid which has been identified by nuclear magnetic resonance (NMR). (Author abstract) 10 refs.

**075002 OXIDATION OF FORMIC ACID AT POLYANILINE-COATED AND MODIFIED-POLYANILINE-COATED ELECTRODES.** The oxida-

tion of formic acid at polyaniline-coated electrodes has been studied. It was found that the oxidation rates at polyaniline are comparable to the rate at a platinized platinum electrode at low over-potentials. Modification of the polymer by cycling on 0.01%  $H_2PtCl_6$  results in a 10-fold increase in activity as compared to platinum. The dependence of oxidation rate on polymer thickness and platinum loading has been investigated. The promoter action of  $PtCl_6^{2-}$  may be related to the exchange of these ions into the polymer or the formation of microparticles of Pt dispersed in the polymer matrix. This study shows that conducting polymers may have interesting applications as fuel cell electrodes. (Author abstract) 16 refs.

**075003 THERMODYNAMICS OF Ru(III)-EDTA CATALYZED OXIDATION OF SATURATED ORGANIC COMPOUNDS BY MOLECULAR OXYGEN.** The thermodynamics of Ru(III)-EDTA catalyzed oxidation of cyclohexane to cyclohexanol and of cyclohexanol to cyclohexanone by molecular oxygen in acidic medium has been investigated in the temperature range 288-318 K,  $\mu = 0.1$  M  $KNO_3$  in a 1:1 water: 1,4-dioxane mixture (v/v). The dependence of the rate of oxidation on factors such as temperature (288-318 K), catalyst, substrates, molecular oxygen concentrations and pH was studied. The mechanisms proposed on the basis of the kinetic data are discussed in terms of thermodynamic stability and reactivity. The activation energy for the oxidation of cyclohexane is 7.3 kcal  $mol^{-1}$  higher than that of cyclohexanol. Thermodynamic factors are more favorable for the oxidation of cyclohexanol, which proceeds by a rate higher than that of cyclohexane. (Edited author abstract) 21 refs.
